CAL. UNIV. LIBRARY

# INDEX

ABELIAN Groups : Infinite (Irving Kaplansky), *review* by Dr. L. S. Goddard, 573
Abercrombie, M. (Ambrose, Dr. E. J., and) : Cinematography in Scientific Research, 726
Åberg, Dr. B. : Plant Growth Substances, 530
Abetti, Prof. Giorgio : Elected an Honorary Fellow of the Royal Society of Edinburgh, 56
  The History of Astronomy (translated from the Italian 'Storia dell' Astronomia' by Betty Burr Abetti), *review* by Prof. W. M. H. Greaves, 323
Abietic Acid : Slow Disappearance of Fluorescence in Thionine on addition of (Prof. Santi R. Palit and Byomkesh Biswas), 214
Abkowitz, Stanley, and others : Titanium in Industry, *review* by P. L. Teed, 804
Ablation of One Eye : Skull Development in Chick Embryos after (A. d'A. Bellairs), 658
Abnormal Freezing Nuclei in the Atmosphere (Dr. B. M. Cwilong), 129
Abnormal Smoke Belt over London (N. G. Helliwell and M. J. Blackwell), 1248
Abraham, Dr. E. P., and others : Identity of Cephalosporin *N* and Synnematin *B*, 551
Abraham, Dr. E. P. (Dougall, D., and) : Xanthomycin A, 256
Abscission : Acceleration of, by a Factor produced in Senescent Leaves (Daphne J. Osborne), 1161, *erratum*, 1200
Absolute Measurement of High Pressures : A New Method for the (R. S. Dadson), 188
Absorption (Paramagnetic Resonance), of Ferrihaemoglobin and Ferrimyoglobin Derivatives (J. E. Bennett, Dr. D. J. E. Ingram, Dr. P. George and J. Stanley Griffith), 394
Absorption (Ultra-Violet), of Lignins : Contribution of Residues containing Carbonyl to the (Dr. D. C. C. Smith), 927
Absorption Edge : Anomalous X-Ray Scattering at Wave-lengths far from an (S. W. Peterson), 395
Absorption Spectrum of Benzoquinone (Prof. R. K. Asundi and Rama Shankar Singh), 1223
Abstracts of New Zealand Scientific Papers, 336
Abstracts of Papers on Radio Engineering (British Institution of Radio Engineers), 381
Abundance of Animals : The Distribution and (H. G. Andrewartha and L. C. Birch), *review* by C. S. Elton, 419
Abuse of English in Science : Use and, 845
Abuse of Protective Equipment : The Use and (British Occupational Hygiene Society Conference on), 448, 1251
Academic Freedom : Universities and, 567
Academic Record of Science Students in the University of New Zealand (I. D. Dick, R. M. Williams and Dermot Straker), 448
Academy of Zoology, Agra, and *Annals of Zoology*, 335
Acaricide : A New—2,4,5,4′-Tetrachlorodiphenylsulphone (Dr. H. O. Huisman, Dr. R. van der Veen and J. Meltzer), 515
Acceleration of Abscission by a Factor produced in Senescent Leaves (Daphne J. Osborne), 1161, *erratum*, 1200
Accelerator of Chondroitin Sulphate Synthesis : Glutamine as an (Harry Boström, Lennart Rodén and Anders Vestermark), 601
Accessories : Radio Isotope Instrumentation and (Dr. D. Taylor and A. G. Peacock), 1102
Accuracy and Reproducibility of Paper Protein Electrophoresis (R. A. Neely and D. W. Neill), 33
Acetate and Propionate (Copper) : Direct Interaction between Copper Ions in the Molecules of (Ryutaro Tsuchida and Shoichiro Yamada), 1171
Acheson, Dr. Roy M. : Social Medicine at Oxford, 57
Acid Character of some Phenolic Resins in relation to their Structure (Prof. R. P. Mitra and S. S. Dube), 79
Acid-Base Indicator : Use of, for Quantitative Paper Chromatography of Sugars (K. J. Gardner), 929
Acid-Strength and Acidity : A Generalization of the Concept of (M. Mandel), 792
Acidity : A Generalization of the Concept of Acid-Strength and (M. Mandel), 792
Acids (Aqueous) : Hydrogen Isotope Exchange between Aromatic Molecules and (Dr. V. Gold and D. P. N. Satchell), 602
Acids ($\gamma$-Lauric and $\gamma$-Myristic) : Unit-Cell Dimensions of (T. R. Lomer), 653
Ackeret, Prof. J. : Cavitation in Hydrodynamics, 809
Ackerman, K. R. : Awarded the Silver Jubilee Commemoration Award of the Illuminating Engineering Society, 724
Acland, J. D. : Probable Nature of an Artefact in the Paper Chromatography of Thyroxine caused by Trichloracetic Acid, 694
Actinomycetales : *Chainia*, a New Genus of the (Dr. M. J. Thirumalachar), 934
Action of Complexes of the Zinc Group Metals on the Tail Protein of Bacteriophage $T_2r^+$ (L. M. Kozloff and K. Henderson), 1169
Action of Insulin on Thiamine Phosphorylation *in vitro* (N. Siliprandi, V. Boffi and A. Lucarelli), 219
Action of *iso*Nicotinic Hydrazide : Mode of (Dr. J. Cymerman-Craig, D. Willis, Prof. S. D. Rubbo and Janice Edgar), 34
Action of Ribonuclease on Two Solid Tumours *in vivo* (L. Ledoux), 36
Action of X-Rays and Alkylating Agents : A Comparative Study of the Mode of (Dr. Iwao Hirono), 1168
Activated Taeniid Hexacanth Embryos : A Technique for Studying the *in vitro* Effect of Serum on (Paul H. Silverman), 598
Active Life and Anabiosis : Rate of Metabolism in Tardigrades during (A. Pigon and B. Weglarska), 121
Acuities of Taste : Some Notably High, for Phenylthiocarbamide (Prof. J. W. H. Lugg), 313
Acyl Trypsins : Inhibitions of, by Human Serum (Dr. M. Bier, J. Sri Ram and Prof. F. F. Nord), 789
Adams, A. A. (Prest, A. R., assisted by) : Consumers' Expenditure in the United Kingdom, 1900–1919, *review*, 4
Adams, C. E., and others : Transfer of Mammalian Ova between Species, 167
Adams, Dr. Walter : Appointed director of planning and principal-designate of the University College of Rhodesia and Nyasaland, 336
Adaptation (Selective) : Colour Anomaly, the Rayleigh Equation and (R. L. Gregory), 172
Adder, *Vipera berus* : Placentation in the (Ruth Bellairs, I. Griffiths and A. d'A. Bellairs), 657
Addison, J. S. : Appointed conservator of forests, grade A, Federation of Malaya, 1248
Adenosine Triphosphate in the Adrenal Medulla of the Cow (Nils-Åke Hillarp, Bodil Nilson and Bertil Högberg), 1032
Adenosine Triphosphate and Metals : Effects of, upon an Electron Transport System in Mitochondria (Frederic L. Hoch and Bert L. Vallee), 256
*Adhatoda vasica* : Antitubercular Effect of an Extract of (Dr. Vincent C. Barry, Michael L. Conalty, F. J. Rylance and F. R. Smith), 119
Adhesion : Theory of (W. G. Cass), 495
Administration (Simultaneous), of Gonadotrophic Hormones : Modification of Response to Adrenocorticotrophic Hormone by the (Barbara E. Clayton and Joyce E. Hammant), 401
Administrative Class of the Civil Service, *review* by R. Brightman, 665
Admiraal, Dr. J., and others : Effect of Inhibition of Cholinesterase on the Motility of the Small Intestine, 468
Admiralty : Summer School for University and Technical College Teachers on Scientific Problems in the Development of Electronic Devices, 102
  Bulletin 67, Personnel Research in the Royal Navy (Surgeon-Comdr. Crosfill), 192
  Sea-going Facilities for Naval Scientific Workers, 1247
Adrenal Cortical Extracts : Nitrogen-containing Steroids in Aqueous (Klaus D. Voigt and Wolfgang Schroeder), 599
Adrenal Medulla of the Cow : Adenosine Triphosphate in the (Nils-Åke Hillarp, Bodil Nilson and Bertil Hogberg), 1032
Adrenal Steroids : Cellular Electrolytes and (Dr. E. Sherwood Jones), 269
Adrenalectomized Rats : Adrenaline and Noradrenaline in Tissues of Normal, Insulin-treated and (Dr. Katharine Montagu), 555
Adrenaline and Noradrenaline : Elimination of, from the Circulating Blood (Dr. Olov Celander and Stefan Mellander), 973
Adrenaline and Noradrenaline in Tissues of Normal, Insulin-treated and Adrenalectomized Rats (Dr. Katharine Montagu), 555
Adrenocorticotrophic Hormone : Modification of Response to, by the Simultaneous Administration of Gonadotrophic Hormones (Barbara E. Clayton and Joyce E. Hammant), 401
Adrian, Rt. Hon. Lord : Receptors and Sensory Perception, *review*, 847
  Functions of the Royal Society (Anniversary Address), 1095
Adsorbents : Protection of Deoxyribonuclease from Ionizing Radiation by (G. L. Fletcher and S. Okada), 882
Adsorption of Methylene Blue by High-Silica Sands (G. Mitchell, P. Poole and H. D. Segrove), 1025
Adult Education (Prof. A. J. Allaway), 177
Adult Education, National Institute of : Report on Liberal Education in a Technical Age, 343
Adult Education, Universities Council for : Report for 1953–54, 686
Adult Mammals (Rodents) : Demonstrations *in vivo* and *in vitro* of Peristaltic Contractions in the Portal Vein of (Prof. G. Attardi), 76
Adventure : Life, the Great (Jean Rostand), (translated by Alan Houghton Brodrick), *review* by T. H. Hawkins, 323
Advisory Council on Scientific Policy : Eighth Annual Report (1954–55), 365, *erratum*, 539
Advisory Council for Scientific and Industrial Research : Appointment of Prof. P. M. S. Blackett and H. Douglass as members, 677
*Aedes aegypti* : Behaviour Differences in Two Strains of (Dr. J. D. Gillett), 124
Aeration of Coliform Cultures (Dr. G. A. Morrison, D. E. Griffiths and M. Harris), 1178
Aerodynamics : General Theory of High Speed (edited by W. R. Sears), *review* by Prof. G. Temple, 479
  Linearized, *review* by Prof. G. Temple, 369
Aeronautical Engineering at the Massachusetts Institute of Technology : Hunsaker Chair of, 768
Aeronautical Research in Canada during the Post-War Decade : The Growth of (Dr. J. J. Green), 493
Aeronautical Society, Royal : British Commonwealth and Empire Lecture (Dr. J. J. Green), 493
  Election of E. T. Jones as president for 1956–57, 723
Aeronautics, College of : Appointment of Prof. A. J. Murphy as principal, 55
Affinities of the Anguinomorph Lizards : The Systematic Position of *Lanthanotus* and the (S. B. McDowell, jun., and C. M. Bogert), 432
Africa : A Mobile Bone Meal Factory in (Dr. I. Mann), 193
Africa (Central), Institute for Scientific Research in : Report for 1952, 387
Africa (East) : Animal and Human Diseases in (Conference in Kampala), 1153
  Development in, 87
  Education in, 536
Africa (East), Royal Commission on : Report for 1953–5[illegible], 87

Africa (East) High Commission : Appointment of G. H. Lampkin as research officer, East African Agriculture and Forestry Research Organization, 16
  Appointment of J. R. Baker as scientific officer (protozoologist), East African Tsetse and Trypanosomiasis Research and Reclamation Organization, 195
  Retirement of Dr. H. H. Storey as deputy director of the East African Agriculture and Forestry Research Organization, 333
  Appointment of Dr. H. C. Pereira as deputy director of the East African Agriculture and Forestry Research Organization, 334
  Appointment of F. Isherwood as scientific officer, entomologist, 1249
  Appointment of M. T. Ashcroft as medical research officer, grade 2, 1249
  Appointment of D. J. Garrod as scientific officer, East African Fisheries Research Organization, 1249
  Appointment of Dr. E. W. Russell as director, East African Agriculture and Forestry Research Organization, 1249
Africa (East and Central) : Research on the Tropical Swamps of, 536
Africa (South) : Education and Race Relations in (Dr. T. B. Davie), 613
  Food Production in, *review* by Sir John Russell, 90
  New and Little-known Ammonites in (E. C. N. van Hoepen), 585
  University Autonomy in, 613
Africa (South, Union of) : A Survey of the Food and Feed Resources of the (G. Van de Wall and E. D. Alvord, Jnr.), *review* by Sir John Russell, 90
Africa (West) : Natural Insecticides in (Dr. F. R. Irvine), 964
African Geology : Research Institute of (Gift of £100,000 from the Anglo-American Corporation of South Africa, Ltd., to the University of Leeds, for the foundation of a), 1152
African (Belgian) National Park of the Garamba : Scientific Exploration of the (Dr. Tracy Philipps), 1011
African (East) Agriculture and Forestry Research Organization : Appointment of G. H. Lampkin as research officer, 16
  Retirement of Dr. H. H. Storey as deputy director, 333
  Appointment of Dr. H. C. Pereira as deputy director, 334
  Appointment of Dr. E. W. Russell as director, 1249
African (East) Fisheries Research Organization : Appointment of D. J. Garrod as scientific officer, 1249
African (East) Medical Research Scientific Advisory Committee : Zoonoses Conference, 1153
African (East) Tsetse and Trypanosomiasis Research and Reclamation Organization : Appointment of J. R. Baker as scientific officer (protozoologist), 195
African (South) Government : Standard 1-Kilogram Weight made for the (L. Oertling, Ltd.), 146
African (South) Institute of Race Relations : Eleventh Hoernlé Memorial Lecture (Dr. T. B. Davie), 613
African (South) Museum, Cape Town (1855–1955), 956
African (South) Universities : Register of Current Scientific Research at, Vol. 3 (Council for Scientific and Industrial Research, Pretoria), 492
African (West) Cacao Research Institute, Gold Coast : Appointment of J. Lamb as director, 910
  Appointment of P. B. Cornwell as senior scientific officer, 1248
  Appointment of P. D. Turner as mycologist, 1249
African (West) Council for Medical Research, Nigeria : Appointment of G. Surtees as research entomologist, 910
African (West) Fisheries Research Institute, Sierra Leone : Appointment of E. A. Salzen as scientific officer, marine biologist, 1249
African (West) Institute for Trypanosomiasis Research, Kaduna : Appointment of Dr. T. A. M. Nash as director, 241
African (West) Tsetse Flies, 537
Afrique Centrale, Institut pour la Recherche Scientifique en : Cinquième Rapport Annuel, 387
After-Life : Disposal of the Dead, and Beliefs in an (British Association for the Advancement of Science, Section H (Anthropology and Archæology), Discussion on), 809
After-Potential of Single Muscle Fibres by 2 : 4-Dinitrophenol : Modification of the (Prof. W. V. Macfarlane and J. D. Meares), 403
Agar Media : Theory of Antibiotic Inhibition Zones in (Prof. K. E. Cooper), 510
Agar Plates : Quantitative Separation of B Vitamins by Electrophoresis on (Dr. G. Marten), 1064
Age of Uraninites from Dimensions of their Unit Cells (S. A. Hiemstra), 405 ; (Dr. B. Wasserstein), 405
Ageing : Endocrinology and (British Association for Research on Ageing : Discussion on), 291
  Research on (Ciba Foundation Awards), 539
Ageing, British Society for Research on : Discussion on Endocrinology and Ageing, 291
Ageing in *Lemna* Fronds : Nitrogen Nutrition, Respiration and (E. Wangermann and H. J. Lacey), 500
Ages of Pitchblende by X-Ray Diffraction (Dr. B. Wasserstein), 159
Ages and Origin of Meteorites (Dr. P. Reasbeck and Dr. K. I. Mayne), 186
Aggarwal, Dr. J. S., and others : Structure of Sterculic Acid, 1082
Agricola, Georgius (1494–1555), (Joan M. Eyles), 949
Agricultural Advisory Service, National : Appointment of E. Ll. Harry as director in Wales, 539
  Appointment of Dr. D. H. Robinson as provincial director of the West Midland Province, 539
  Appointment of S. L. Huthnance as deputy provincial director for the West Midland Province, 957
Agricultural Botany, National Institute of : Address to the Fellows (Sir William Slater), 287
  Annual Report for 1954 (Prof. T. Jenkin), 287
Agricultural Bureaux, Commonwealth : Publication of *Veterinary Reviews and Annotations*, No. 1, 99
  Appointment of J. E. C. Coventry as chairman, 241
  History, Work, Administration and Finance of the, revised edition, 287
Agricultural Chemicals : Risk to Wild Life of, 380
Agricultural Contractors Association (British), and others : First National Crop Protection Conference (Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture), 1203
Agricultural Delegation to visit the U.S.S.R. : British 491
Agricultural Engineers (British), Institution of : New Premises, 1003
  Inauguration of a Western Centre, 1003
Agricultural Experiments : A Variable Dosage Sprayer for (Dr. R. Pfeiffer, R. T. Brunskill and Dr. G. S. Hartley), 472
Agricultural Research Laboratories : Laboratory Design—Survey of Space and Services Requirements in Two (R. Llewelyn Davies and J. W. Nightingale, and Norman T. J. Bailey), 999, 1249
Agricultural and Food Representatives in Canada : United Kingdom, 378
Agriculture : Plant Regulators in (edited by H. B. Tukey), *review* by Prof. L. J. Audus, 137
  Toxic Chemicals in—Risks to Wild Life, 380
Agriculture (American) : Plant Growth Regulators in, *review* by Prof. L. J. Audus, 137
Agriculture, Department of (Fiji) : Appointment of I. T. Twyford as chemist, 910
Agriculture, Department of (Northern Region, Nigeria) : Appointment of K. D. S. Baldwin as economist, 1249
Agriculture, Department of (Ottawa) : Retirement of Dr. A. G. Lochhead as chief of the Bacteriology Division, Science Service, 629
  Appointment of Dr. H. Katznelson as chief of the Bacteriology Division, Science Service, 629
Agriculture, Department of (Uganda) : Appointment of J. R. Simpson as chemist, 539
  Appointment of J. C. Davies as entomologist, 1248
Agriculture in Northern Ireland, Ministry of : Pamphlet on Forestry in Northern Ireland, 288
Agriculture for Scotland, Department of : Postgraduate Scholarships in Husbandry Awards, 677
Agriculture, Fisheries and Food, Ministry of, and others : First National Crop Protection Conference (Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture), 1203
Ahmad, Dr. K., and Islam, M. F. : Ramnacin, a New Antibiotic from a *Streptomyces* sp., 646
Aichinger, E. : Problems of International Concern in the Biological Sciences, 243
Ainsworth, Dr. L. : Appointed lecturer in glass technology at the University of Sheffield, 101
Air : Occurrence of the Alga *Gloeocapsa* in the (Prof. P. H. Gregory, Elizabeth D. Hamilton and T. Sreeramulu), 1270
Air Ministry : L. G. Groves Memorial Prize for Aircraft Safety awarded to Squadron-Leader J. Harvey, 768
  L. G. Groves Memorial Prize for Meteorology awarded to Dr. F. J. Scrase, 768
  L. G. Groves Memorial Award for Meteorological Observers awarded to Flight-Lieut. J. Formby, 768
Air Pollution (Edward Burke), 85 ; (The Editors), 85
Air Pollution in Britain, 335
Air Spora of Southern Nigeria : Seasonal Changes in Three Common Constituents of the (R. H. Cammack), 1270
Airborne Micro-organisms : A Water-soluble Filter for Trapping (Merfyn Richards), 559
Aitchison, J. : Appointed lecturer in mathematics at the University of Glasgow, 957
Ajl, Dr. Samuel J. (Wong, Dr. D. T. O., and) : Isocitritase in *Escherichia coli*, 970
Akazawa, Takashi, and Uritani, Dr. Ikuzo : Respiratory Increase and Phosphorus and Nitrogen Metabolism in Sweet Potato infected with Black Rot, 1071
L(+)-Alanine-Dehydrogenase in *Bacillus subtilis* : Occurrence of an (J. M. Wiame and A. Piérard), 1073
S-Alanyl Coenzyme A : Synthesis and Properties of (Charles J. Stewart and Prof. Theodor Wieland), 316
Albert I (Prince) of Monaco Commemorative Medal (the Manley-Bendall Prize) of the Oceanographical Institute of Monaco awarded to Dr. J. N. Carruthers, 16, *erratum*, 58
Alberty, R. A., and others : Physical Chemistry of Enzymes, 958
Albrecht, F. O. : Locust Phases, 591
Albumin (Bovine Serum), in Urea Solution : Molecular Weight of Ovalbumin and of (H. A. McKenzie, M. B. Smith and R. G. Wake), 738
Alcohol : Ion-Exchange Chromatography in (Dr. K. K. Carroll), 398
Alcohols (Polyhydric) : Paper Electrophoresis of (Dr. D. Gross), 362
Alder, K. : Advances in Organic Chemistry, 761
Aleem, Prof. A. A. : Botany of Seaweed, 1107
*Aleurites montana* : Rainfall and Biennial Bearing in Tung (D. H. Laycock and L. J. Foster), 654
Alexander, Dr. P., and Smith, Dr. L. F. : Chemistry of Wool, 713
Alexander, Dr. P., and Stacey, Dr. K. A. : Dissociation of Deoxyribonucleic Acid by Urea, 162
  Progress in Radiobiology, 683
Alexander, Dr. P. (Bacq, Prof. Z. M., and) : Fundamentals of Radiobiology, *review* by Dr. J. F. Loutit, 230
Alexander, Dr. P. (Charlesby, A., and) : Chemical Effects of Ionizing Radiation, 197
Alexandrowicz, Dr. J. S. : Marine Biological Research, 108
Alfonso, Dr. C. : Awarded a renewal of a Ramsay Memorial Fellowship, 336
Alford, Violet : Disposal of the Dead, and Beliefs in an After-Life, 811
Alfvén, Prof. H. : Magneto-Hydrodynamics, 234
  On the Origin of the Solar System, *review* by Thomas Gold, 274
Alga *Gloeocapsa* in the Air : Occurrence of the (Prof. P. H. Gregory, Elizabeth D. Hamilton and T. Sreeramulu), 1270
Algae : Fat Accumulation by (D. M. Collyer and G. E. Fogg), 586
Algae (Green) : Role of Photochemical Processes in the Reduction of Nitrate by (Dr. Erich Kessler), 1069
Algae (Plankton) : An Effect of Antibiotics produced by (Prof. E. Steemann Nielsen), 553
Algar, Prof. J. : Chemistry of Naturally Occurring Pyrones, 637
Alimchandani, H. R., and Sreenivasan, Dr. A. : Inhibition Steps in Sulphonamide Bacteriostasis, 702
Aliphatic Research Co., Ltd. : Grant of £285 a year to Queen's University, Belfast, for a research studentship in organic chemistry, 57
Alkali Halides : Electrical Effects associated with the Mechanical Deformation of Single Crystals of (J. E. Caffyn and T. L. Goodfellow), 878
Alkaloid Group (Veratrum) : Application of Paper Chromatography to Structural Problems in the (K. Macek and Z. J. Vejdelek), 1173
Alkaloids : Curare (Prof. P. Karrer), 277

Alkaloids of *Rauwolfia serpentina* Benth: Anti-acetylcholine and Antihistamine Actions of the Total (M. L. Chatterjee and H. F. Häusler), 701
Alkyl Halides: A Correlation between the Rates of Unimolecular Pyrolysis of, in the Gaseous Phase and $S_N1$ Rates in Solution (Dr. Allan Maccoll and Dr. P. J. Thomas), 392
Alkyl Phosphates (Tertiary), Thiolophosphates and Thionophosphates: A General Method for Locating the Spots on a Paper Chromatogram of (Dr. Irmgard K. H. Otter), 1078
*n*-Alkyl Pyridium and *n*-Alkyl Trimethyl Ammonium Halides: Separation within the Homologous Series of *n*-Alkyl Sulphates, by Paper Chromatography (H. Holness and W. R. Stone), 604
*n*-Alkyl Sulphates, *n*-Alkyl Pyridium and *n*-Alkyl Trimethyl Ammonium Halides: Separation within the Homologous Series of, by Paper Chromatography (H. Holness and W. R. Stone), 604
*n*-Alkyl Trimethyl Ammonium Halides: Separation within the Homologous Series of *n*-Alkyl Sulphates, *n*-Alkyl Pyridium and, by Paper Chromatography (H. Holness and W. R. Stone), 604
Alkylating Agents: A Comparative Study of the Mode of Action of X-Rays and (Dr. Iwao Hirono), 1168
Allan, Dr. J. F.: Cavitation in Hydrodynamics, 808
Allaway, Prof. A. J.: Adult Education, 177
Alleles (Mutant) (t-Alleles), in Populations of Wild House Mice: Widespread Distribution of (Prof. L. C. Dunn), 1275
Allen, A. O. (Schuler, R. H., and): Chemical Effects of Ionizing Radiation, 197
Allen, Prof. C. W.: Solar Eclipses and the Ionosphere, 948
Allen, D. N. de G.: Appointed to the chair of applied mathematics in the University of Sheffield, 98; work of, 98
Allen, G. Keith: Appointed to the University of London readership in mining at the Imperial College of Science and Technology, 57
Allen, J. W. (Mackintosh, I. M., and): Intermetallic Semiconductors, 342
Allfrey, Dr. V. G., and others: Protein Synthesis in Isolated Cell Nuclei, 1042
Allison, Prof. P. R.: Pulmonary Circulation and Respiratory Function, 961
Alloxan with Ascorbic Acid: Reaction of (Prof. M. C. Nath and E. P. M. Bhattathiry), 787
Alloys (Americium–Beryllium): Neutron Yields from (O. J. C. Runnalls and R. R. Boucher), 1019
Allsopp, Dr. A.: British Mosses and Liverworts, *review*, 1237
Almquist, Erik: Distribution Maps of Scandinavian Species of *Hieracium*, 240
Alpern, B.: Coal Science, 105
Alperovitch, Edward A., and Miller, J. M.: Occurrence of Technetium-98 in Nature, 299
Alpha- and Beta-Lead Azide: Sensitivity of (Peter Gray and T. C. Waddington), 653
Alpine Club (Royal Geographical Society and the): Mount Everest Foundation, 239
Altitude (High) Research (National Institute of Science of India Symposium, at the Gulmarg Research Observatory), 448
Altitude (High-) Rockets: Exploration of the Earth's Upper Atmosphere, using—British Research Programme (Sir David Brunt), 282
Aluminium: Electron Micrographs from Thick Oxide Layers on (C. J. L. Booker, J. L. Wood and A. Walsh), 222
Aluminium in Shipbuilding: The Use and Welding of (Institute of Welding, the British Welding Research Association, the Institution of Naval Architects, the British Shipbuilding Research Association and the Aluminium Development Association Symposium on), 957
Aluminium Borohydride: Preparation of, and its Applications in Organic Reductions (J. Kollonitsch and O. Fuchs), 1081
Aluminium Development Association, and others: Symposium on the Use and Welding of Aluminium in Shipbuilding, 957
Alvarenga Prize for 1955 awarded by the College of Physicians of Philadelphia to Dr. C. H. Rammelkamp, 336
Alvord, jnr., E. D. (Van de Wall, G., and): A Survey of the Food and Feed Resources of the Union of South Africa, *review* by Sir John Russell, 90
Amat, G.: Advances in Molecular Spectroscopy, 682
Ambe, K. S. (Sohonie, Prof. Kamala, and): Crystalline Inhibitors of Trypsin from Potato, 972
Ambler, H. R.: Humidity and Corrosion, 1082
Ambrose, Dr. E. J., and Abercrombie, M.: Cinematography in Scientific Research, 726
Ambrose, Dr. E. J. (Easty, Dr. G. C., and): Combined Amino-Acid Content of Tumour and Homologous Normal Tissue, 1256
America: The Golden Eagle in (Lee W. Arnold), 247
America (North): Geophysical Research in, *review* by B. C. Browne, 943
Hair Embroidery in Siberia and (Geoffrey Turner), 724
American Academy of Arts and Sciences: Award of Francis Amory Prizes, 723
American Agriculture: Plant Growth Regulators in, *review* by Prof. L. J. Audus, 137
American Association for the Advancement of Science: Meeting in Atlanta, 1004
American Association of Physics Teachers: Annual Meeting, 638
Oersted Medal presented to Prof. V. E. Eaton, 638
Citations for meritorious service voted to W. S. Webb and M. W. Zemansky, 639
Election of Officers for 1955, 639
American Chemical Industry (Williams Haynes), Vol. 1, Background and Beginnings, 1608–1910; Vol. 5, Decade of New Products, 1930–1939, *review*, 618
American Chemical Society: Monograph Series, No. 122, Copper (edited by Allison Butts), *review* by A. R. Bailey, 526
News Service brochure on Public Relations for the Chemical Profession, 908
American Coot: Breeding Behaviour of the (G. W. Gullion), 389
American Ephemeris and Nautical Almanac for the Year 1956, *review*, 137
American Philosophical Society: Year Book for 1954, 63
*Transactions* of the, Vol. 45, Part 1, Life of Clarence Luther Herrick (Prof. C. J. Herrick), 336
American Physical Society: Annual Meeting, 638
Retiring Presidential Address (Prof. H. A. Bethe), 638
Richtmyer Memorial Lecture (Prof. E. P. Wigner), 638
Election of Officers for 1955, 639
Americanists: International Congress of (Proceedings of the Thirtieth), 1103
Americium–Beryllium Alloys: Neutron Yields from (O. J. C. Runnalls and R. R. Boucher), 1019
Amines (Aromatic): Metabolism of Two, in the Dog (L. Bradshaw and Dr. D. B. Clayson), 974
Amines (Different Sympathomimetic): Some Differences in the Effects of, on the Isolated Innervated Rat Diaphragm Preparation (Dr. Katharine A. Montagu), 738
Amino-Acid Content of Tumour and Homologous Normal Tissue: Combined (Dr. G. C. Easty and Dr. E. J. Ambrose), 1256
Amino-Acid Copolymers (Antibiotically Active), related to Gramicidin S (Dr. Ephraim Katchalski, Arieh Berger, Leah Bichowsky-Slomnicki and Joseph Kurtz), 118
Amino-Acid Sequence of Alpha-Corticotropin (Prof. Choh Hao Li, Dr. Irving I. Geschwind, Dr. R. David Cole, Dr. Ilse Dorothea Raacke, Dr. J. Ieuan Harris and Dr. Jonathan S. Dixon), 687
Amino-Acids: Liberation of, by Oat Seedlings (Dennis Parkinson), 35
Amino-Acids (Free): Distribution of, in Embryos of *Xenopus laevis* (Dr. E. M. Deuchar), 258
Amino-Acids in Plant Materials: New Free (Dr. C. B. Coulson), 518
Amino-Acids and Oligopeptides at Very High Potential Gradients: Paper Electrophoresis of (Dr. D. Gross), 72
Amino-Groups of Soluble Feather Keratin: The Free (A. M. Woodin), 1117
Ammonia: A Source of, and Changes of Protein Structure in the Rat Brain during Physical Exertion (Dr. R. Vrba), 117
Ammonia Production (Ruminal): Hypomagnesaemia in Dairy Cattle and its Possible Relationship to (M. J. Head and J. A. F. Rook), 262
Ammoniacal Nickel Cyanide: Benzene-$^{14}C_1$ from the Neutron Irradiation of the Clathrate with (Alfred P. Wolf, Carol S. Redvanly and R. Christian Anderson), 831
Ammonites in South Africa: New and Little-known (E. C. N. van Hoepen), 585
Ammonium Halides (*n*-Alkyl Trimethyl): Separation within the Homologous Series of *n*-Alkyl Sulphates, *n*-Alkyl Pyridium and, by Paper Chromatography (H. Holness and W. R. Stone), 604
Amoroso, Prof. E. C.: Breeding of Laboratory Animals, 244
Immunity and Development, 853
Amorphous Polyethylene Terephthalate: Density of (A. B. Thompson and D. W. Woods), 78
Amory (Francis) Prize Awards (American Academy of Arts and Sciences), 723
Amphibioidei, Choanichthyes or Sarcopterygii?: Herpetichthyes (Prof. Alfred Sherwood Romer), 126; (Dr. Ethelwynn Trewavas, Dr. E. I. White, N. B. Marshall and Denys W. Tucker), 126
Amplification of 1-cm. Waves in the Helium Negative Glow (Dr. Z. Geller and Dr. W. Low), 1021
Anabiosis: Rate of Metabolism in Tardigrades during Active Life and (A. Pigon and B. Weglarska), 121
Anaerobic Metabolism of Thiocyanate by Thiobacilli (J. P. van der Walt and C. D. de Kruyff), 310
Analyse spectrale quantitative par la flamme (Dr. R. Mavrodineanu et H. Boiteux), *review* by J. R. Scansfield, 185
Analysis of Development (edited by Prof. Benjamin H. Willier, Prof. Paul A. Weiss and Prof. Viktor Hamburger), *review* by Prof. C. H. Waddington, 477
Analysis on the Small Scale: Elementary Qualitative (Dr. Peter Woodward), *review* by G. Fowles, 481
Analysis (Radioactivation), of Phosphorus in Silicon (J. A. James and D. H. Richards), 1026
Analytical Chemistry, Society for (Biological Methods Group): Conference on Biological and Microbiological Methods of Estimating Vitamin $B_{12}$, 384
Analytical Chemistry, Society for, and others: Symposium on the Use of Radioactive Materials in Biological Assay, 427
Analytical Inorganic Chemistry: Principles of, *review* by Dr. Albert Wassermann, 1137
Analytischen Chemie: Grundlagen der, und der Chemie in wässerigen Systemen (Prof. F. Seel), *review* by Dr. Albert Wassermann, 1137
Anand, V. D., and others: A Method of Determining Particle Size of Powders, 692
Anaphylactic, Peptone and Tryptic Shock: Release of Histamine in Hepatectomized Dogs during (H. Moussatché), 648
Anaphylaxis: Inhibition of Histamine Release in (Dr. J. L. Mongar and Dr. H. O. Schild), 163
Anatomy of the Monocotyledons: Systematic (C. R. Metcalfe), 147
Andaman Islanders (Dr. H. Lehmann), 964
Andersen, Dr. G.: Algal Chemistry, 1107
Anderson, D. L.: High-Energy Nuclear Physics, 373
Anderson, Dr. F. W.: Stratigraphical Palaeontology, *review*, 1136
Anderson, L.: Chemical Effects of Ionizing Radiation, 198
Anderson, P. J. S.: Appointed veterinary officer, Tanganyika, 195
Anderson, R. Christian, and others: Benzene-$^{14}C_1$ from the Neutron Irradiation of the Clathrate with Ammoniacal Nickel Cyanide, 831
Anderson, Dr. T. F.: Tuberculosis as a Problem of Different Races, 245
Anderson (P. J.) Memorial Lecture, 1954 (Sir Hector Hetherington), 522, 567
Anderson-Berry (David) Silver-Gilt Medal for 1956 (Royal Society of Edinburgh), 1249
Andrus, R. K., and others: Effects of Hypothermia on Behaviour, 1015
Andrade, Prof. E. N. da C.: Sir Isaac Newton, *review* by Dr. N. H. de V. Heathcote, 616
Literature of the Science of the Past, *review*, 663
Andrewartha, H. G., and Birch, L. C.: The Distribution and Abundance of Animals, *review* by C. S. Elton, 419
Andrewes, Dr. C. H.: Myxomatosis, 1155
Andrews, Major L. E.: Land Use in Britain, 339
Andross, Miss M.: Energy Value of Food, 153
Angelic Acids (Tiglic and): Configurations of—an X-Ray Determination (A. L. Porte and Prof. J. Monteath Robertson), 1116
Anglo-American Corporation of South Africa, Ltd.: Gift of £100,000 to the University of Leeds for the foundation of a Research Institute of African Geology under the direction of Prof. W. Q. Kennedy, 1152
Anguinomorph Lizards: The Systematic Position of *Lanthanotus* and the Affinities of the (S. B. McDowell, jun., and C. M. Bogert), 432

Animal Calls: Characteristics of some (Dr. P. Marler), 6
Animal Care Panel: Proceedings of the Annual Meetings of the, 102
Animal Cell: Aspects of the, *review* by Dr. D. R. Newth, 664
Animal Endurance, 776
Animal Health Trust: Appointment of Dr. K. C. Sellers as director of the Farm Livestock Research Station at Stock, Essex, 583
Animals Houses: The Design of (W. A. Hemmings), 527
Animal Migration (Dr. G. V. T. Matthews), 772
Animal Movement (British Association for the Advancement of Science, Sections D (Zoology) and I (Physiology), Discussion on), 1060
Animal Origin: Transformation of Pentose Phosphates by Enzymes of (Prof. Frank Dickens and D. H. Williamson), 400
Animal Populations: Natural Control of, *review* by C. S. Elton, 419
Animal Production, European Association of: Fifth 'Study Meeting' (Animal Production from Grass), 728
Animal Production from Grass (Fifth 'Study Meeting' of the European Association of Animal Production), 728
Animal Protein Factors of Casein: Relationship between Orotic Acid and (R. Viviani, M. Marchetti, A. Rabbi and Prof. G. Moruzzi), 464
Animal Tissue: Changes in, after Hydrocortisone Administration—Production of Dystrophic Calcification of Cardiac Muscle in Mice by Hydrocortisone (Lowell L. Sparks, Werner Rosenau, Rex N. MacAlpin, Thomas A. Deane and Prof. Choh Hao Li), 503; Deposition Induced by Hydrocortisone of Calcium in the Heart Tissue of Female $C_3H$ Mice (Ardis Lostroh and Prof. Choh Hao Li), 504
Animal Tissues: Cytochromes of Microsomal Particles—Cytochrome $b_5$ of Microsomes from (Margot Bailie and Dr. R. K. Morton), 111
  Metabolism of Propionic Acid in (Dr. Martin Flavin, Priscilla J. Ortiz and Prof. Severo Ochoa), 823
Animal Welfare, Universities Federation for: Summer School, 195
  Pamphlet on Kind Killing (Dr. Jean Vinter), revised edition, 862
Animal and Human Diseases in East Africa: Conference in Kampala, 1153
Animals: Birds as (James Fisher), I, A History of Birds, *review* by Sir Norman Kinnear, 481
  The Distribution and Abundance of (H. G. Andrewartha and L. C. Birch), *review* by C. S. Elton, 419
  Humane Killing of, 862
  The Language of Birds and other (Eric Simms), 677
  Man and, *review* by Prof. F. J. Cole, 418
  Measurement of Surface Pigmentation in (A. J. Lea), 558
Animals (Domestic), in the Gold Coast: Blood Counts in (Prof. E. E. Edwards, J. M. Judd and F. A. Squire), 549
Animals (Farm): Fertility in (British Association for the Advancement of Science, Section M (Agriculture), Discussion on), 620
Animals (Laboratory): Breeding of (Laboratory Animals Bureau Symposium on), 243
Animals, Men and Myths (Morus) (Richard Lewinsohn), *review* by Prof. F. J. Cole, 418
Anisotropy of Effective Gas Diffusion Coefficients in Extruded Carbon Rods (P. L. Walker, jun., Frank Rusinko, jun., and Emile Raats), 1167
Anisotropy in a Permanent Magnet: Production of, by Pressure (J. E. Gould and M. McCaig), 977
Ankel, W.: Problems of International Concern in the Biological Sciences, 242
*Annals of Applied Biology*, Vol. 42 (Proceedings of the Jubilee Meeting of the Association of Applied Biologists), 816
*Annals of Zoology*: Academy of Zoology, Agra, and, 335
Annan, Noel: The Revolt against Reason (The General Intellectual Revulsion to the Right), 521
l'Année psychologique (rédacteurs: Henri Piéron, Alfred Fessard et Paul Fraisse), cinquante-quatrième année, 1954, *review* by Prof. John Cohen, 230
Anode and Cathode Arcs (Dr. L. H. Germer and Dr. W. S. Boyle), 1019
Anomalies in the Cosmic-Ray Shower Curves for Lead (Prof. Rafi Mohammed Chaudhri, Abdul Qayum and Afzal Farooqi), 876
Anomalous X-Ray Scattering at Wave-lengths far from an Absorption Edge (S. W. Peterson), 395
Anomers (Glucose): Specificity in Chemical and Enzymatic Oxidations of (Dr. Ronald Bentley), 870
Antagonism to Lysergic Acid Derivatives: Role of 5-Hydroxytryptamine in Mental Diseases and its (A. Cerletti and Prof. E. Rothlin), 785
Anterior Eye Chamber of Young Cats: Long-term Transplants of Infantile Rat Pituitaries cultivated *in vitro* and Grafted into the (Dr. P. M. Martinovitch and D. V. Radivojevitch), 699
Anthracene in *n*-Hexane: Radiolysis of Liquid *n*-Hexane and Solutions of (Dr. F. H. Krenz), 1113
*Anthrenus verbasci* L.: Inability of Varied-Carpet Beetle Larvae, to digest Chitin (Ch. Jeuniaux), 1129
*Anthropologist, The*: New Indian Journal, 380
Anthropology—a Scientific Unity? (Dr. D. B. Harden), 443
Anthropology, Biogeography and History: The Botany of Cook's Voyages and its Unexpected Significance in relation to (Prof. Elmer Drew Merrill), *review* by Dr. Eric Ashby, 850
Anti-acetylcholine and Anti-histamine Actions of the Total Alkaloids of *Rauwolfia serpentina* Benth (M. L. Chatterjee and H. F. Häusler), 701
Antibiotic from a *Streptomyces* sp.: Ramnacin, a New (Dr. K. Ahmad and M. F. Islam), 646
Antibiotic Inhibition Zones in Agar Media: Theory of (Prof. K. E. Cooper), 510
Antibiotically Active Amino-Acid Copolymers related to Gramicidin S (Dr. Ephraim Katchalski, Arieh Berger, Leah Bichowsky-Slomnicki and Joseph Kurtz), 118
Antibiotics: An Effect of, produced by Plankton Algae (Prof. E. Steemann Nielsen), 553
  Effect of, on Indole Synthesis by *Escherichia coli* 7-4 (Dr. F. Gibson, Marjorie J. Jones and H. Teitscher), 164
Antibiotics (Translocated), in Expressed Plant Sap: Evidence of (S. H. Crowdy and D. Pramer), 335
Antibodies in Young Rabbits: Inhibition of the Production of Precipitating (A. E. R. Downe), 740
Antigen, *Chra*: A New Rare Blood-Group (F. Kissmeyer-Nielsen), 313
Antigens (Typhoid Vi and O): Production of 'O Inagglutinability' in Erythrocytes coated with (Dr. Maurice Landy and Ruggero Cappellini), 1266
Anti-histamine Actions: Anti-acetylcholine and, of the Total Alkaloids of *Rauwolfia serpentina* Benth (M. L. Chatterjee and H. F. Häusler), 701
Anti-histamine Substances: Effect of, on Cold Vasodilatation in the Finger (G. C. Whittow), 511
Anti-Locust Research Centre: Discussions on Locust Research, 590
Antimitotic Agents: Control of Fertility by (Dr. B. P. Wiesner and Prof. John Yudkin), 249
Anti-proton: The Negative Proton, or (Announcement by the University of California and the United States Atomic Energy Commission of the detection of), 860
Antitubercular Effect of an Extract of *Adhatoda vasica* (Dr. Vincent C. Barry, Michael L. Conalty, H. J. Rylance and F. R. Smith), 119
Anti-Tuberculous Activity of Verazide (1-isoNicotinoyl-2-veratrylidene Hydrazide), (Dr. S. D. Rubbo and Dr. J. Cymerman-Craig), 887
Anti-tumorigenic Action of Iodinated Compounds (Prof. F. B. Oberhauser, Prof. H. R. Croxatto, M. Q. Gaillard and V. M. Silva), 466
Aphid Chromosomes (A. W. Colling), 207
Aphid Species: Selection of, by Different Kinds of Insect Traps (V. F. Eastop), 936
Apparatus and Techniques (Laboratory), with particular reference to Instrumentation (Manchester and District Section of the Royal Institute of Chemistry Exhibition of), 1104
Apparent Change from Cytoplasmic to Nuclear Control of a Form of Chlorophyll Deficiency in *Gossypium arboreum* L. (Bhola Nath), 316
Apparent Reciprocal Exchange of Characters between the *Mel* and NWS Strains of Influenza A Virus in the Brain of One-day Old Mice (Dr. K. B. Fraser), 212
Apparent Resistance of a Snail to Infection in the Gold Coast (Fergus S. McCullough), 981
Apparent Transformation of Collagen Fibrils into 'Elastin' (Prof. D. Burton, Dr. D. A. Hall, Dr. M. K. Keech, Dr. R. Reed, Miss H. Saxl, Prof. R. E. Tunbridge and Miss M. J. Wood), 966
Appleman, Prof. M. D.: Food Microbiology and Public Health, 374
Appleton, Sir Edward: The Partnership of Science and Engineering (Andrew Laing Lecture of the North-East Coast Institution of Engineers and Shipbuilders), 821
Appleton, Sir Edward, and others: Distortion of the *E* Layer of the Ionosphere by Electrical Currents Flowing in it, 897
Application of Paper Chromatography to Structural Problems in the Veratrum Alkaloid Group (K. Macek and Z. J. Vejdělek), 1173
Application of Research: Organization and (Symposium at the Twelfth International Congress of Applied Psychology), 449
Applications of Spectroscopy to Chemical Problems and on Intermolecular Forces and the Properties of Fluids (Summer School at the University of Cambridge), 1104
Applications of Ultrasonics (Centre National de Recherches Scientifiques Conference on), 387
Applied Bacteriology, Society for: Election of Officers, 149
  Symposium on Food Microbiology and Public Health, 373
Applied Biologists, Association of: Proceedings of the Jubilee Meeting, 816
*Applied Biology, Annals of*, Vol. 42 (Proceedings of the Jubilee Meeting of the Association of Applied Biologists), 816
Applied Chemistry: First International Congress on Documentation of, 956
Applied Chemistry (Pure and): Fourteenth International Congress of, 58, 759
Applied Chemistry (Pure and), International Union of: Eighteenth Conference, 58
  Approval of the recommendation of the Commission on Nomenclature in Inorganic Chemistry that Element 101 be named Mendelevium, symbol Mv, 586
Applied Electricity at Bangor, 334
Applied Mathematics at Sheffield, 98
*Applied Physics, British Journal of* (edited by Dr. H. R. Lang), Vol. 5 (1954), and Supplement No. 3, The Physics of Particle Size Analysis, *review*, 1091
Applied Psychology: Evaluation of Methods in, and the Problem of Criteria (Symposium at the Twelfth International Congress of Applied Psychology), 449
  Twelfth International Congress of (Alec Rodger), 449
Applied Solar Energy Research (edited by E. J. Burda), *review* by Dr. H. Heywood, 804
Applied X-Rays (Prof. George L. Clark), fourth edition, *review* by Prof. H. Lipson, 573
Approximate Joint Probability Distribution for Wave Amplitude and Frequency in Random Noise (R. A. Wooding), 564
Aqueous Acids: Hydrogen Isotope Exchange between Aromatic Molecules and (Dr. V. Gold and D. P. N. Satchell), 602
Aqueous Adrenal Cortical Extracts: Nitrogen-containing Steroids in (Klaus D. Voigt and Wolfgang Schroeder), 599
Aqueous Solutions of Polymethacrylic Acid: Negative Thixotropy of (J. Eliassaf, A. Silberberg and Prof. A. Katchalsky), 1119
*Arabidopsis thaliana* (L.) Heynh.: Biochemical Mutations in the Crucifer (J. Langridge), 260
Arachnid *Palamneus swammerdami*: Occurrence of Chitin in the Epicuticle of an (Dr. G. Krishnan, G. N. Ramachandran and M. S. Santanam), 557
Arbeitsgemeinschaft für Fertigungstechnisches Messwesen and the Institut für Härteprüftechnik: International Conference on Hardness Measurement in the Works, 194
Arber, Dr. Agnes: The Mind and the Eye, *review* by Dr. Eric Ashby, 369
Archæological Survey of the Union of South Africa: Retirement of Prof. C. van Riet Lowe from the directorship, 149
Archæological and Geological Investigations in South Australia, 492
Archives: Scientific Film (Dr. A. R. Michaelis), 1194
Arctic (Norwegian): Winter Observations on a Zone of Climatic Modification in the (N. C. Negri), 292
Arctic Waters (Canadian Eastern): Density Inversions in (Dr. M. J. Dunbar), 703
Arcs: Anode and Cathode (Dr. L. H. Germer and Dr. W. S. Boyle), 1019
Ardern, L. L.: Library Resources for Industry and Commerce in the Manchester Area, 199
Argon and Krypton: The Solid–Liquid Equilibrium Diagram of (R. Heastie), 747
Argyris, Dr. J. H.: Appointed to the chair of aeronautical engineering at the Imperial College of Science and Technology, 13; work of, 13

Arid Zones: Ecology of, 776
Arkell, Dr. W. J.: Geological, Dynamical and Palæomagnetic Aspects of Polar Wandering, 423
Arley, Dr. Niels: The Duplication Mechanism of Deoxyribonucleic Acid, 465
Armament Research and Development Establishment: Symposium on Plasticity of Materials, 544
Armitage, P., and others: Lowered 'Capillary Resistance' after Iontophoresis of Lysergic Acid Diethylamide, 563
Armstrong, Dr. D. A.: Appointed Brotherton research lecturer in physical chemistry at the University of Leeds, 862
Armstrong, F. A. J.: Marine Biological Research, 108
Army Council: Appointment of Patrick Johnson as scientific adviser, 539
Armytage, Prof. W. H. G.: Civic University, Aspects of a British Tradition, 567; review by J. F. Wolfenden, 411
Arnold, Dr. A. H. M.: Appointed to the University of London readership in electrical engineering at King's College, 539
Arnold, Lee W.: The Golden Eagle in America, 247
Arnott, Prof. W. Melville: Pulmonary Circulation and Respiratory Function, 961
Aromatic Amines in the Dog: Metabolism of Two (L. Bradshaw and Dr. D. B. Clayson), 974
Aromatic Molecules (Substituted): Molecular Orbital Theory of the Relative Reactivities of, towards Radical Addition (H. H. Greenwood), 1024
Aromatic Molecules and Aqueous Acids: Hydrogen Isotope Exchange between (Dr. V. Gold and D. P. N. Satchell), 602
Arsenious Sulphide Sol in the Region of Slow Coagulation: Electrophoretic Measurement of the True Zeta-Potential of (Prof. B. N. Ghosh and K. C. Ray), 1080
Art Galleries (British Museums and): A Museums Calendar for (Museums Association), 240
Artefact: Probable Nature of an, in the Paper Chromatography of Thyroxine caused by Trichloracetic Acid (J. D. Acland), 694
Arthropod-borne Fevers of North Queensland: Relationships between the Flying Fox (Genus *Pteropus*) and (J. L. O'Connor, L. C. Rowan and J. J. Lawrence), 472
Arthropods and Molluscs from Herbage: A Method for Sampling, by Suction (Dr. C. G. Johnson, Dr. T. R. E. Southwood and Mrs. H. Entwistle), 559
Artobolevskii, I. I.: Automation in the Soviet Union, 293
Arts, Royal Society of: Thomas Holland Memorial Lecture (Sir Alfred Egerton), 492
Ascent of Mont Blanc: First (Sir Gavin de Beer and Max H. Hey), 100
Asch, Dr. Solomon E.: Opinions and Social Pressure, 1009
Aschaffenburg, Dr. R., and Drewry, J.: Occurrence of Different Beta-Lactoglobulins in Cow's Milk, 218
Ascites Tumour (Sarcoma 37 Mouse): Growth of, in Peritoneal Fat (Dr. Peter Warner), 1030
Ascites Tumour Cells (Ehrlich): Separation of, from other Cellular Elements (Prof. Per Eric Landahl and George Klein), 401
Ascorbic Acid: Reaction of Alloxan with (Prof. M. C. Nath and E. P. M. Bhattathiry), 787
Ascorbic Acid Content of Baobab Fruit (W. R. Carr), 1273
Asexual Fungi: Speciation and Variation in (edited by R. W. Miner), 240
Ash, Dr. E. A., and others: Langmuir's Paradox, 916
Ashall, C. (Stower, W. J., and): Estimation of Numbers of Locusts, 590
Ashby, Dr. Eric: That Inward Eye, *review*, 369
  The Botany of Cook's Voyages and its Unexpected Significance in relation to Anthropology, Biogeography and History, *review*, 850
Ashcroft, M. T.: Appointed medical research officer, grade 2, East Africa High Commission, 1249
Ashley, Dr. G. T.: Supra-sternal Ossicles in Primates other than Man—some Isolated Cases in Gorilla and Chimpanzee, 608
Ashmore, A.: High-Energy Nuclear Physics, 372
Ashmore, Dr. P. G., and Levitt, B. P.: Thermal Reaction between Hydrogen and Nitrogen Dioxide, 1013
Ashton, G. C.: Use of Radioactive Materials in Biological Assay, 428
Ashton, Sir Leigh: Presidential message to the Sixty-first Annual Conference of the Museums Association, 246
Ashworth, Dr. R. de B.: Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Aslib (Northern Branch): Conference on Library Resources for Industry and Commerce in the Manchester Area, 198
Aspirator and Feeding Cage: A Combined, for the Collection and Testing of Insects as Vectors of Plant Viruses (J. T. Legg), 609
Assam Valley: Vegetation of the (Prof. E. P. Stebbing), 200
Assay (Biological): Use of Radioactive Materials in (Society of Analytical Chemistry, the Royal Institute of Chemistry, the Society of Chemical Industry and the Chemical Society Symposium on), 427
Assay (Microbiological), of Thiamin (Vitamin $B_1$): A New Method for the (J. R. Villanueva), 465
Associated Electrical Industries, Ltd., and others: Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
Association between the *P* and *Jay* Systems of Blood Groups (Dr. Ruth Sanger), 1163
Astbury, Prof. W. T.: Inaugural lecture at the International Wool Textile Research Conference, Australia, 712
Åstrand, Dr. P.-O.: New Records in Human Power, 922
Astronomer Royal: Report to the Board of Visitors of the Royal Greenwich Observatory, 641
Astronomical Clock in York Minster, 954
Astronomical Cuneiform Texts, Babylonian Ephemerides of the Seleucid Period for the Motion of the Sun, the Moon and the Planets (edited by O. Neugebauer), Vol. 1, Introduction, The Moon; Vol. 2, The Planets, Indices; Vol. 3, Plates, *review* by R. W. Sloley, 569
Astronomical Seeing (Symposium at the Observatories of the University of Cambridge), 864
Astronomical Society, Royal: Presentation to Prof. F. J. M. Stratton, 378
  Eddington Medal for 1955 presented to Prof. H. C. van de Hulst, 378
Astronomical Symposium: Cambridge, 864
Astronomical Union, International: General Assembly in Dublin, 336; (Prof. R. O. Redman), 626
  Symposium No. 1, Co-ordination of Galactic Research, *review* by Prof. R. O. Redman, 847
Astronomy: Babylonian, *review* by R. W. Sloley, 569
  The History of (Prof. Giorgio Abetti), (translated from the Italian 'Storia dell' Astronomia' by Betty Burr Abetti), *review* by Prof. W. M. H. Greaves, 323
  Meteor (Prof. A. C. B. Lovell), *review* by Dr. J. S. Hey, 135
Astronomy (Meteor): Radio Techniques in, *review* by Dr. J. S. Hey, 135
Astronomy (Radio): International Research in (Dr. R. L. Smith-Rose), 1110
Asundi, Prof. R. K., and Singh, Rama Shankar: Absorption Spectrum of Benzoquinone, 1223
Atlantic (Western North): Fishes of the (Henry B. Bigelow and William C. Schroeder), Part 2, Sawfishes, Guitarfishes, Skates and Rays, Chimaeroids, *review* by Dr. G. A. Steven, 139
Atmosphere: Abnormal Freezing Nuclei in the (Dr. B. M. Cwilong), 129
  Exploration of the Earth's Upper, using High-Altitude Rockets—British Research Programme (Sir David Brunt), 282
  Radiative Balance in the (Royal Society Discussion on), 635
Atmosphere (Lunar): Lunar Occultation of a Radio Star and the Derivation of an Upper Limit for the Density of the (B. Elsmore and G. R. Whitfield), 457
Atmospheric Pollen (H. A. Hyde), 546
Atmospheric Pollution in Britain, 891, 955
Atomic Energy: Peaceful Uses of (United Nations International Conference on), 99; (Ford Motor Co. to provide an Annual Prize for the best contribution to the subject of), 286; (United Kingdom Atomic Energy Authority and the Indian Department of Atomic Energy Agreement on the promotion and development of the), 1247
  The United Nations and the Peaceful Uses of, 225
  Peaceful Uses of—The Geneva International Conference (Sir John Cockcroft), 482
  Peaceful Uses of—Chemical, Metallurgical and General Technological Sessions at Geneva (Dr. R. Spence), 574; Reactor Physics and Chemistry (Dr. J. Gaunt and D. J. Littler), 619; Biology and Medical Sessions at Geneva (Dr. L. F. Lamerton), 765; Radioisotopes in Chemistry, Technology and Industry (Dr. Henry Seligman), 854
  Prominent part played by British physicists in the United Nations on, to be recorded in the Minutes of the Institute of Physics, 725
  Unclassified Reports on (United Kingdom Atomic Energy Authority), 1003
Atomic Energy, Indian Department of (United Kingdom Atomic Energy Authority and the): Agreement on the promotion and development of the Peaceful Uses of Atomic Energy, 1247
Atomic Energy Authority, United Kingdom: Reduction in the prices of Iodine-131 and Colloidal Gold-198, 334
  Use of Radioactive Caesium for Cancer Treatment, 379
  Appointment of W. Strath as a full-time member, 770
  Appointment of Sir Rowland Smith and C. F. Kearton as part-time members, 770
  Unclassified Reports on Atomic Energy, 1003
  Gift of £3,675 to the Department of Chemical Engineering, University of Birmingham, for research on the characteristics of 'Spraypak', 1055
  Gift of £3,225 to the Department of Physical Metallurgy, University of Birmingham, for research on the properties of ionic crystals, 1055
  First Annual Report for 1954–1955, 1193
Atomic Energy Authority, United Kingdom, and the Indian Department of Atomic Energy: Agreement on the promotion and development of the Peaceful Uses of Atomic Energy, 1247
Atomic Energy Authority, United Kingdom (Scientific Instrument Manufacturers Association and the): Radio Isotope Instrumentation and Accessories (Dr. D. Taylor and A. G. Peacock), 1102
Atomic Energy Authority Industrial Group, United Kingdom: The Culcheth Laboratories of the (Dr. A. B. McIntosh), 484
Atomic Energy Commission, United States (University of California and the): Announcement of the detection of the Negative Proton, or Anti-proton, 860
Atomic Energy Developments and Man-power Problems in Britain, 1183
Atomic Energy Exhibit at the British Industries Fair, 956
Atomic Energy Research at Harwell (K. E. B. Jay), *review* by Dr. P. J. Grant, 370
Atomic Energy Research Establishment: Meeting to consider programmes of Genetic Research, 448
Atomic Masses in the Chromium–Germanium Region: Reliability of (John T. Kerr, John G. V. Taylor and Prof. Henry E. Duckworth), 458
Atomic Scientists (British): Visit of, to the U.S.S.R., 954
Atomic Standard of Frequency and Time Interval—A Caesium Resonator (Dr. L. Essen and J. V. L. Parry), 280; Definition of the Second o Time (Sir Edward Bullard), 282, erratum, 381
Atomic and Microscopic Dimensions: Structure on a Scale between the (International Union of Crystallography Symposium on), 1153
Atomphysik (Dr. Karl Bechert und Dr. Christian Gerthsen), Band 1, Allgemeine Grundlagen, Teil 1 und Teil 2, *review* by Dr. E. Bretscher, 526
Atoms for Britain Exhibition to be shown at the British Industries Fair, 956
Atoms in the Family—My Life with Enrico Fermi, Designer of the First Atomic Pile (Laura Fermi), *review* by Prof. O. R. Frisch, 850
Atoms for Peace Awards, 814
Attar, T. (Hafez, Dr. E. S. E., and): Urinary Œstrogens in the Buffalo a measured Chemically, 796
Attardi, Prof. G.: Demonstration *in vivo* and *in vitro* of Peristaltic Contractions in the Portal Vein of Adult Mammals (Rodents), 76
Attenuated Strains of Myxoma Virus in Europe: Occurrence of (Prof. Frank Fenner and I. D. Marshall), 782
Attitude on Mental Output: Effect of Foresight and (Prof. E. Mira y Lopez), 449
Attitudes, Opinions and Behaviour (Symposium at the Twelfth International Congress of Applied Psychology), 450
Attwood, Miss M. E.: Modern Cytological Techniques in the Early Diagnosis of Cancer, 730
Auber, Dr. L.: Cortex and Medulla of Bird-Feathers, 1218

*Biochemical Journal* : Resignation of Dr. A. Neuberger from the chairmanship of the Editorial Board, 195
  Appointment of Dr. A. G. Ogston as chairman of the Editorial Board, 195
  Editorial office to be transferred to the Lister Institute of Preventive Medicine, 195
Biochemical Mutations in the Crucifer *Arabidopsis thaliana* (L.) Heynh. (J. Langridge), 260
Biochemical Society (Scottish Branch of the Nutrition Society and the) Symposium on Cholesterol and Fat Metabolism in relation to Die and Disease, 288, 774
Biochemical Synthesis and Isotopic Tracer Technique, 193
Biochemical and Microbiological Research in Hungary—Some Impressio (Dr. M. R. Pollock), 1156
Biochemistry : Mammalian, *review* by Prof. D. C. Harrison, 276
  Meaning of 'Turnover' in (Dr. C. A. Mawson), 317
  Principles of (Prof. Abraham White, Prof. Philip Handler, Prof. Em L. Smith and Dr. DeWitt Stetten), *review* by Prof. D. C. Harrison, 27
  Third International Congress of, 634
Biochemistry and Isotopic Tracer Technique : Chemistry, (Dr. G. Popják) 193
Biogeochemistry : Marine Organisms and (British Association for th Advancement of Science, Sections D (Zoology), B (Chemistry) an C (Geology), Discussion on), 818

Biogeography and History : The Botany of Cook's Voyages and its Unexpected Significance in relation to Anthropology, (Prof. Elmer Drew Merrill), *review* by Dr. Eric Ashby, 850
Biological Aspects of the Transmission of Disease (Institute of Biology Symposium on), 493
Biological Assay : Use of Radioactive Materials in (Society for Analytical Chemistry, the Royal Institute of Chemistry, the Society of Chemical Industry and the Chemical Society Symposium on), 427
Biological Growth, *review*, 46
Biological Organization (Prof K. Mather), 445
Biological Properties of Reserpine and related Compounds : Paper Chromatographic and (Dr. R. L. Boscott and Dr. Amiya B. Kar), 1077
Biological Races of *Phytophthora infestans* in Canada (K. M. Graham and H. N. Racicot), 432
Biological Research : Marine (Dr. N. B. Eales), 108
Biological Research, Station in the Apennines : Centro Appenninico, Terminillo—, 630
Biological Rhythm : Fifth Congress on (Societas pro Studio Rhythmi Biologici), 149
Biological Sciences : Problems of International Concern in the (International Union of Biological Sciences Symposium on), 242
Biological Sciences, International Union of : Symposium on Problems of International Concern in the Biological Sciences, 242
Biological and Microbiological Methods of Estimating Vitamin $B_{12}$ (Biological Methods Group of the Society for Analytical Chemistry Conference on), 384
Biologists : Mathematics for, *review* by Prof. K. Mather, 1136
Biologists (Applied), Association of : Proceedings of the Jubilee Meeting, 816
Biology, Institute of : Symposium on Biological Aspects of the Transmission of Disease, 493
    New Headquarters for the, 723
Biology, Institute of (Scottish Branch) : Conference on Fresh-water Biology in Scotland, 677
Biology in Schools, *review* by Dr. W. L. Sumner, 570
Biology in Secondary Schools, with Special Reference to Grammar Schools : The Teaching and Learning of (Prof. L. T. Green), second edition, *review* by Dr. W. L. Sumner, 570
Biology of the Nucleic Acids : Chemistry and, *review* by Dr. E. Stedman, 801
Biology of Phospholipids : Chemistry and (Biochemistry Division of the Chemical Institute of Canada Symposium on), 241
Biology of Tropical Swamps : Research on the (Grant of £21,900 from the Nuffield Foundation to Makerere College, Uganda, for), 536
Biology of Tsetse Flies, *review* by Dr. T. A. M. Nash, 755
*Biology (Applied), Annals of*, Vol. 42 (Proceedings of the Jubilee Meeting of the Association of Applied Biologists), 816
Biology (Cell) : Eighth International Congress for (International Society for Cell Biology), 105
Biology (Cell), Society for : Election of Prof. P. J. Gaillard as president, 105
Biology (Experimental) : Cambridge Monographs in, *review* by Prof. J. F. Danielli, 136
Biology (Fresh-water), in Scotland (Scottish Branch of the Institute of Biology Conference on), 677
Biology (Human), for the Masses, *review* by T. H. Hawkins, 323
Biology and Human Affairs, 1111
Biology and Medical Sessions at Geneva : Peaceful Uses of Atomic Energy—(Dr. L. F. Lamerton), 765
Biomathematics (Dr. Cedric A. B. Smith), *review* by Prof. K. Mather, 1136
Biometric Society : International Biometric Symposium, 1058
Biometric Symposium in Brazil : International (Dr. D. J. Finney), 1058
Biosystematics of the *Sisymbrium irio* Complex (T. N. Khoshoo), 608
Birch, L. C. (Andrewartha, H. G., and) : The Distribution and Abundance of Animals, *review* by C. S. Elton, 419
Birch, Dr. S. F. : Sorting Molecules, 1188
Bird, Lieut.-Colonel G. W. G. : Haemagglutinins of *Glycine soja*, 1127
Bird-Feathers : Cortex and Medulla of (Dr. L. Auber), 1218
Bird Preservation, International Committee for : Annual Report for 1954, 769
Birds as Animals (James Fisher), 1, A History of Birds, *review* by Sir Norman Kinnear, 481
Birds in Zoological Gardens : Pathology of (Prof. L. M. G. Geurden), 1255
Birds (Bower-) : Function of the Bower of (Ellis McNamara), 207
Birds and other Animals : The Language of (Eric Simms), 677
Birefringence (Flow) : Variation of, with Stress (Dr. A. S. Lodge), 838
Birge, Prof. R. T. : Elected president for 1955 of the American Physical Society, 639
Birkbeck College, London : Appointment of Dr. W. G. Overend to the University of London readership in organic chemistry, 194
Birthday Essays : Niels Bohr, *review* by Prof. W. E. Burcham, 1186
Bishop, Dr. J. F. W. : Plasticity of Materials, 544
Bishop, M. W. H. : Fertility, 340
Bishop, Norman I., and Spikes, John D. : Inhibition by Cyanide of the Photochemical Activity of Isolated Chloroplasts, 307
Bishop, O. N. : Association of School Natural History Societies—Annual Exhibition 1955, 1007
Biswas, Byomkesh (Palit, Prof. Santi R., and) : Slow Disappearance of Fluorescence in Thionine on addition of Abietic Acid, 214
Biswas, Dr. K. P. : Retirement as superintendent of the Indian Botanic Garden, 238 ; work of, 238
    Appointed director-in-charge of Medicinal Plants Schemes in India, 910
Bitumens and related Fossil Carbonaceous Substances : Coals and (Dr. S. I. Tomkeieff), *review* by Dr. J. Bronowski, 184
Blaauw, A. (edited by) : Co-ordination of Galactic Research, *review* by Prof. R. O. Redman, 847
Black, Dr. Gordon : Ultra High-speed Skew-ray Tracing, 27
Black-Flies (Diptera, Simuliidae) of Guatemala and their Role as Vectors of Onchocerciasis (Herbert T. Dalmat), *review* by Dr. John Smart, 1238
Black-fly, *Simulium ornatum* Mg. : Behaviour of Young and Old Females of the (L. Davies), 979
Black Rot : Respiratory Increase and Phosphorus and Nitrogen Metabolism in Sweet Potato infected with (Takashi Akazawa and Dr. Ikuzo Uritani), 1071
Blackburn, Dr. S., and Lee, G. R. : Chemistry of Wool, 713
Blackett, Prof. P. M. S. : Appointed a member of the Advisory Council for Scientific and Industrial Research, 677
Blackith, R. E. : Locust Phases, 591
Blackler, Dr. H. : Botany of Seaweed, 1108
Blacklock, Prof. D. B. : *Obituary* by Prof. R. M. Gordon, 97
Blackman, Prof. G. E. : Plant-Growth Substances, 531
Blackwell, M. J. (Helliwell, N. G., and) : Abnormal Smoke Belt over London, 1248
Blair, E. L., and others : Lowered 'Capillary Resistance' after Iontophoresis of Lysergic Acid Diethylamide, 563
Blakemore, Prof. F. : *Obituary* by Prof. R. E. Glover, 581
Blalock, Prof. A. : Elected a foreign associate of the Paris Academy of Sciences, 1200
Blanc-Lapierre, Prof. A., et Perrot, Prof. M. : Conductibilité électrique des lames métalliques minces, *review* by Prof. L. F. Bates, 416
Bland, D. R. : Plasticity of Materials, 544
Blandau, Prof. Richard J. : Film on Reproduction in the Rat, 341
Blane, M. A. : Appointed assistant director of agriculture, Gold Coast, 195
Blaxter, K. L., and Graham, N. McC. : Energy Value of Food, 152
Bleaching, Dyeing and Finishing To-day (Society of Dyers and Colourists Symposium on), 149
Bligh, Dr. John : Comparison of Rectal and Deep Body Temperature in the Calf, 402
Blocking of Lead Tetraacetate—Schiff Reactions in Tissue Sections by Boric Acid (Dr. P. H. Staple), 1125
Blood of Normal and of Tumour-bearing Rats : Immunological Discrimination between the (Dr. D. A. Darcy), 643
Blood (Circulating) : Elimination of Adrenaline and Noradrenaline from the (Dr. Olov Celander and Stefan Mellander), 973
Blood Cells (Red), of Sheep : Genetic Control of Sodium and Potassium Concentrations in the (J. V. Evans and J. W. B. King), 171
Blood Counts in Domestic Animals in the Gold Coast (Prof. E. E. Edwards, J. M. Judd and F. A. Squire), 549
Blood Factors *P* and *Q* : Relationship between (Dr. K. Henningsen and Dr. Tyge Jacobsen), 1179
Blood-flow (Venous), in the Mammary Region of the Sheep and Goat : Variations in the Direction of (J. L. Linzell and L. E. Mount), 37
Blood-Group Antigen, *Chra* : A New Rare (F. Kissmeyer-Nielsen), 313
Blood Groups : An Association between the *P* and *Jay* Systems of (Dr. Ruth Sanger), 1163
Blood Picture of the Guinea Pig : Normal (D. L. J. Bilbey and Prof. T. Nicol), 1218
Blood Plasma (Fibrin Structure) : Regeneration of the Filtrable Forms of *Salmonella enteritidis* in Media containing (L. Juhász and J. Vadász), 208
Blood Platelets : Origin of (J. H. Humphrey), 38
Blood Transfusion : Offer of an award for work in connexion with (Oliver Memorial Fund), 58
Blout, E. K. : Advances in Molecular Spectroscopy, 682
'Blow' of Whales (F. C. Fraser and P. E. Purves), 1221
Boag, J. W., and Gluckmann, A. : Progress in Radiobiology, 684
Board, P. A. : Appointed fisheries officer, Eastern Region, Nigeria, 910
Boas, Jr., Ralph Philip : Entire Functions, *review* by Dr. L. S. Goddard, 185
Bockris, Prof. J. O'M. : Appointed to the chair of physical chemistry in the University of the Witwatersrand, 629 ; work of, 629
Bodo, Gerhard : Crystalline Cytochrome *c* from the King Penguin, 829
Body Musculature of Lepidoptera : A Proprioceptor in the (L. H. Finlayson and Prof. Otto Lowenstein), 1031
Body Temperature in the Calf : Comparison of Rectal and Deep (Dr. John Bligh), 402
Boell, Edgar J. (edited by) : Dynamics of Growth Processes, *review*, 46
Boffi, V., and others : Action of Insulin on Thiamine Phosphorylation *in vitro*, 219
Bogert, C. M. (McDowell, jun., S. B., and) : The Systematic Position of *Lanthanotus* and the Affinities of the Anguinomorph Lizards, 432
Bohr (Niels) and the Development of Physics—Essays dedicated to Niels Bohr on the occasion of his Seventieth Birthday (edited by W. Pauli, with the assistance of L. Rosenfeld and V. Weisskopf), *review* by Prof. W. E. Burcham, 1186
Bohr (Niels) Birthday Essays, *review* by Prof. W. E. Burcham, 1186
Boissard, Joan (Fry, R. M., and) : Food Microbiology and Public Health, 373
Boiteux, H. (Mavrodineanu, Dr. R., et) : L'Analyse spectrale quantitative par la flamme, *review* by J. R. Stansfield, 185
Bolsterli, Dr. A. M. : Appointed to a fellowship in mathematical physics in the University of Birmingham, 1055
Bolton, A. (Raeber, J. G., and) : A New Form of Male Sterility in *Nicotiana tabacum* L., 314
Bomb : The—Challenge and Answer (Prof. Alexander Haddow, Bertrand Russell, Lord Beveridge and Henry Usborne), edited by Gilbert McAllister, 522 ; *review* by R. Brightman, 894
Bombardment of Beryllium by Deuterons : Neutrons produced in the (Fedor Boreli and Branislav Lalovic), 1021
*Bombyx mori* L. : Studies on Transaminase and Decarboxylase Catalysed by Extracts of the Silkworm (B. Bheemeswar), 555
Bomford, Brigadier G. : Conference of Commonwealth Survey Officers, 1057
Bond, Dr. G. : An Introduction to Plant Physiology, *review*, 481
Bond, Dr. G., and MacConnell, J. T. : Nitrogen Fixation in Detached Non-legume Root Nodules, 606
Bond, R. L. : Coal Science, 104
Bond-Powel, Mrs Lydia : The American Wing of the Metropolitan Museum of Art, New York, 246
Bondi, Prof. H. : Magneto-Hydrodynamics, 236
    At the Conference in celebration of the Jubilee of the Relativity Theory, 331
Bone (Human Skull) : Portion of a, discovered at Swanscombe by Mr. and Mrs. B. O. Wymer, J. Wymer and Adrian Gibson, 287
Bone Meal Factory in Africa : A Mobile (Dr. I. Mann), 193
Bone Repair and Animal Endurance, 776
Bonet-Maury, P., and Patti, F. : Chemical Effects of Ionizing Radiation, 197
Bonnardel, Prof. R. : Organization and Application of Research, 449
Bonner, Prof. J. : Plant Growth Substances, 531
Bonner, Prof. John Tyler : Cells and Societies, *review* by C. W. W., 992
Bonner, W. Nigel : Reproductive Organs of Foetal and Juvenile Elephant Seals, 982
Bonnett, R., and others : Structure of Vitamin $B_{12}$—The Structure of Vitamin $B_{12}$ and its Hexacarboxylic Acid Degradation Product, 328

Book Purchase in British Libraries : Subject Specialization and Co-operative (K. G. Hunt), 62
Booker, C. J. L., and others : Electron Micrographs from Thick Oxide Layers on Aluminium, 222
Books : Recent Scientific and Technical, Supp. vi, July 30 ; Supp. viii, August 27 ; Supp. viii, September 24 ; Supp. viii, October 29 ; Supp. viii, November 26 ; Supp. vi, December 31
Books (Scientific), Libraries and Collectors (John L. Thornton and R. I. J. Tully), *review* by Prof. E. N. da C. Andrade, 663
Books and Papers : Scientific, 939
Boot, Dr. H. A. H. : Design of Electronic Devices for Production, 1059
Boot, Dr. L. : Endocrinology and Ageing, 291
Booth, Dr. A. D. : Use of a Computing Machine as a Mechanical Dictionary, 565
Booth, Dr. A. D., and Cleave, Dr. J. : Information Theory, 774
Booth, G. A. : Forests of the Upper Nile Province, 1862–1950, 15
Booth and Brothers, Joseph : Gift of £700 to the University of Leeds, for the Department of Civil Engineering, 194
Booz, G., and others : Progress in Radiobiology, 684
Boreli, Fedor, and Lalovic, Branislav : Neutrons produced in the Bombardment of Beryllium by Deuterons, 1021
Boric Acid : Blocking of Lead Tetraacetate—Schiff Reactions in Tissue Sections by (Dr. P. H. Staple), 1125
Born, Prof. Max : At the Conference in celebration of the Jubilee of the Relativity Theory, 331
Bornstein, J., and Hartman, Beryl D. : Effect of Thioctic Acid on Glucose Oxidation by Liver Slices, 788
Borohydride (Aluminium) : Preparation of, and its Applications in Organic Reductions (J. Kollonitsch and O. Fuchs), 1081
Boron : Condition of, in Alpha Iron (W. R. Thomas and G. M. Leak), 29
Borough Polytechnic, London : New Paint Testing Laboratory opened by Lord McCorquodale, 584
Borstel, R. C. von, and Moser, H. : Progress in Radiobiology, 683
Borsuk, Prof. K. : Awarded a Polish Medal for distinguished work in topology, 336
Boscott, Dr. R. J., and Kar, Dr. Amiya B. : Paper Chromatographic and Biological Properties of Reserpine and related Compounds, 1077
Bose, Prof. S. R. : Location of Enzymes in Mitochondria Fractions, 122
  *Obituary* of Prof. H. K. Mookerjee, 721
Bose (Sir J. C.) Premium for 1954 of the British Institution of Radio Engineers awarded to S. Deb, 536
Bostrom, Harry, and others : Glutamine as an Accelerator of Chondroitin Sulphate Synthesis, 601
Botanic Gardens (Royal), Kew : Work during 1954, 1009
Botanical Origin : Copals and their (L. Hellinck), 910
Botanical Society of the British Isles, 146
Botany at St. Andrews, 1002
Botany of Cook's Voyages and its Unexpected Significance in relation to Anthropology, Biogeography and History (Prof. Elmer Drew Merrill), *review* by Dr. Eric Ashby, 850
*Botrytis fabae* Sardiña : Photo-reactivation of, measured by a Local-lesion Technique (F. T. Last and E. W. Buxton), 655
Botterill, Dr. J. S. M. : Appointed lecturer in chemical engineering at the University of Birmingham, 1055
Bottles : Sodium in Empty Ether (D. Rainy Brown), 448
Boucher, R. R. (Runnalls, O. J. C., and) : Neutron Yields from Americium—Beryllium Alloys, 1019
Boughey, Prof. A. S. : Appointed to the chair of botany in the University College of Rhodesia and Nyasaland, 99 ; work of, 99
Bourne, Dr. E. J. : Appointed to the University of London chair of chemistry at the Royal Holloway College, 1104, 1197
Bourne, Dr. E. J., and others : Enzymic Synthesis of a 'Branched' Trisaccharide, 1164
Bourne, Dr. G. H. : Endocrinology and Ageing, 291
  The Venezuelan Institute for Neurology and Brain Research, 1049
Bourne, Dr. G. H., and Danielli, Prof. J. F. (edited by) : International Review of Cytology, Vol. 3, *review* by Dr. D. R. Newth, 664
  International Review of Cytology, Vol. 4, *review* by Prof. J. Brachet, 1135
Bovine Malignant Catarrh : Elementary Bodies in (D. Daskin), 518
Bovine Serum Albumin in Urea Solution : Molecular Weight of Ovalbumin and of (H. A. McKenzie, M. B. Smith and R. G. Wake), 738
Bowden, Dr. B. V. : Manchester College of Technology—Grant of a Charter, 812
  Impact of Science on Management in the Future, 1109
Bowden, Dr. F. P. : Awarded an Elliott Cresson Medal by the Franklin Institute, 16
  Some Recent Experiments in Friction—Friction on Snow and Ice and the Development of some Fast-Running Skis, 946
Bowden, Dr. F. P., and Freitag, E. H. : Some Recent Experiments in Friction—Friction of Solids at High Speeds, 944
Bowden, Dr. F. P., and others : Metallic Transfer in Drilling and its Significance in Orthopaedic Surgery, 826
Bowden, J., and Lowy, Dr. J. : The Lamellibranch Muscle—Innervation, 346
Bowen, Prof. E. G. : *Obituary* of Prof. Wilfred Smith, 767
Bowen, Dr. E. J. : Triplet States in Excited Molecules, 768
Bowen, Dr. H. J. H. : Marine Organisms and Biogeochemistry, 819
Bower of Bower-birds : Function of the (Ellis McNamara), 207
Bower-birds : Function of the Bower of (Ellis McNamara), 207
Bown, Miss E. L. : Semi-micro Methods used in Paediatric Biochemistry, 730
Boyd, Dr. G. S. : Cholesterol and Fat Metabolism in relation to Diet and Disease, 775
Boyd, I. A. : Appointed a lecturer in physiology at the University of Glasgow, 957
Boyd, Prof. J. D. : *Obituary* of Prof. C. F. W. McClure, 627
Boyd, Brigadier J. S. K. : Appointed a Trustee by the Wellcome Trustees, 288
  Resignation as director of the Wellcome Laboratories of Tropical Medicine, London, 1054 ; work of, 1054
Boyd, Dr. R. L. F. : Radiative Balance in the Atmosphere, 636
Boyd, Prof. William C. : Maximum Likelihood Calculation of *Rh* Gene Frequencies in Pacific Populations, 648
Boyer, A. F. : Coal Science, 104
Boyle, R. B. : Appointed a principal agricultural supervisor, Nyasaland, 910
Boyle, Dr. W. S. (Germer, Dr. L. H., and) : Anode and Cathode Arcs, 1019
Boys (Charles Vernon) Prize for 1956 of the Physical Society awarded to Dr. G. D. Rochester and Dr. C. C. Butler, 241
Braarud, Prof. Trygve : Opening Address at the Second International Seaweed Symposium, 1106
Brabazon Premium for 1954 of the British Institution of Radio Engineers awarded to J. W. Jenkins, J. H. Evans, G. A. G. Wallace and D. Chambers, 536
Brachet, Prof. J. : Modern Cytology, *review*, 1135
Brackish Water : International Co-operation on Purification of, 286
Bradford, Dr. B. W. : Sorting Molecules, 1188
Bradley, Dr. D. : Appointed lecturer in mechanical engineering at the University of Leeds, 194
Bradley, H. : Use and Abuse of Protective Equipment, 1252
Bradshaw, A. D., and Pritchard, Tom : Ecology of Snowdonia—Wild White Clover in Natural Mountain Grassland, 596
Bradshaw, L., and Clayson, Dr. D. B. : Metabolism of Two Aromatic Amines in the Dog, 974
Bradshaw, S. E. : Chemical Aspects of Semiconductors, 154
Braekkan, Olaf R. : Role of Pantothenic Acid in the Reproductive Cycle of Ovaries in Fish, 598
Braekkan, Olaf R. (Lambertsen, Georg, and) : A Possible New Vitamin $A_1$ Isomer in the Eyes of Crustaceans, 553
Bragg, Sir Lawrence : The Discovery of Useful Electricity, 724
Bragg's X-Ray Microscope : A Simple Version of (B. D. Dunkerley and Prof. H. Lipson), 81
Brain, Sir Russell : Semantics, 674
Brain of One-day Old Mice : Apparent Reciprocal Exchange of Characters between the *Mel* and *NWS* Strains of Influenza A Virus in the (Dr. K. B. Fraser), 212
Brain (Rat) : Significance of Glutamic Acid in Metabolic Processes in the, during Physical Exercise (Dr. R. Vrba), 1258
  A Source of Ammonia and Changes of Protein Structure in the, during Physical Exertion (Dr. R. Vrba), 117
Brain Factor Influencing the Viability of Neurotropic Rift Valley Fever (Dr. A. Polson and T. I. Madsen), 645
Brain Research : The Venezuelan Institute for Neurology and (Dr. Geoffrey H. Bourne), 1049
Braithwaite, Prof. R. B. : An Empiricist's View of the Nature of Religious Belief (Ninth Eddington Memorial Lecture), 632
Brambell, Prof. F. W. Rogers : Immunity and Development (Presidential Address to Section D (Zoology) of the British Association for the Advancement of Science), 441, 852
  Importance of Larval Characters in Classification, 911
'Branched' Trisaccharide : Enzymic Synthesis of a (Dr. R. W. Bailey, Dr. S. A. Barker, Dr. E. J. Bourne and Prof. M. Stacey), 1164
Bransden, B. H. : Appointed a lecturer in natural philosophy at the University of Glasgow, 957
*Brassica* sp. : History of Cole (G. E. Fussell), 48
Brasted, Prof. Robert C. : The Halogens (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted, Vol. 3), *review* by H. A. C. McKay, 229
Brasted, Prof. Robert C., and others (edited by) : Comprehensive Inorganic Chemistry, Vol. 2, Copper, Silver, Gold (J. W. Last) ; Vol. 3, The Halogens (Prof. Robert C. Brasted), *review* by H. A. C. McKay, 229
Braude, Dr. E. A. R. : Appointed to the University of London chair of organic chemistry at the Imperial College of Science and Technology, 57, 285 ; work of, 285
  Organo-Metallic Compounds, 60
  Advances in Organic Chemistry—Fourteenth International Congress of Pure and Applied Chemistry, 759
Braunitzer, G., and others : Terminal Groups of Tobacco Mosaic Virus, 456
Brazilian Society for the Progress of Science : Seventh Annual Meeting, 544
Bread Rolls made with Fish Flour, 101
Breakdown in Hydrogen : Mechanism of Uniform Field (A. Wilkes, W. Hopwood and N. J. Peacock), 837
Brecon Beacons National Park, 629
Breeder, jun., C. M. : Pentagonal Symmetry in Nature, 1159
Breeding of Laboratory Animals (Laboratory Animals Bureau Symposium on), 243
Breeding Behaviour of the American Coot (G. W. Gullion), 389
Breit, Dr. G. : Theoretical Physics, 589
Brenes-Pomales, Dr. Arturo, and others : Gene Control of Copper-Sensitivity in *Saccharomyces*, 841
Bretscher, Dr. E. : Atomphysik, *review*, 526
Breuil, Abbé Henri : Elected an Honorary Fellow of the Royal Society of Edinburgh, 56
Brewer, Dr. A. W. : Radiative Balance in the Atmosphere, 636
Brewer, Dr. D. B. : Title of reader in pathology in the University of Birmingham conferred on, 862
Brews, Miss V. A. L. : Electrophoretic Patterns of Blood Sera and the Flocculation Tests, 730
Bridges and other Flexible Structures : Wind Effects on (National Physical Laboratory, Notes on Applied Science, No. 11), 822
Briefwechsel von Johann Bernoulli (herausgegeben von der Naturforschenden Gesellschaft in Basel), Band 1, *review* by Prof. T. G. Cowling, 1187
Brien, P., et autres : Vertébrés—Embryologie, grands problèmes d'anatomie comparée, caractéristiques biochimiques (Traité de zoologie, publié sous la direction de Pierre-P. Grassé, Tome 12), *review* by Prof. C. H. O'Donoghue, 756
Briggs, Dr. B. H. : Awarded an I.C.I. Fellowship by the University of Cambridge, 381
  Astronomical Seeing, 865
Bright, Dr. A. W., and Thorp, J. S. : Measurements of Retarding Potential on the Hollow Cathode, 1079
Brightening of the Solar Limb in the Far Ultra-Violet (C. M. Minnis), 652
Brightman, R. : Library Resources for Industry and Commerce in the Manchester Area, 199
  Liberty in the Modern World, *review*, 525
  Administrative Class of the Civil Service, *review*, 665
  Education and Social Development in the Colonies, *review*, 757
  International Control of Nuclear Weapons, *review*, [illegible]94
  Problems of Technical Library Services in Great Britain, *review*, 1090

Brill, R., and Ender, H. : Separation of Ions at Crystallization of Water, 925
Brimble, L. J. F. (Balls, Dr. W. Lawrence, and) : *Obituary of Prof. F. J. Lewis*, 237
Britain : Air Pollution in, 335
  Atmospheric Pollution in, 891
  Atomic Energy Developments and Man-power Problems in, 1183
  Atoms for (Exhibition to be shown at the British Industries Fair), 956
  Colonial Students in (Report by PEP), 320, 591
  Development of Industrial Relations in, 799
  Grants to Students in Training Colleges in, 295
  Higher Technological Education in, 1085
  Land Use in (Division for Social and International Relations of Science of the British Association for the Advancement of Science Conference on), 338
  Myxoma Virus in (J. R. Hudson, Harry V. Thompson and W. Mansi), 783
  New Nature Reserves in, 239, 684
  Roman Roads in (Ivan D. Margary), Vol. 1, South of the Foss Way—Bristol Channel, *review* by Sir Mortimer Wheeler, 3
  Scientific Man-power in, and its Utilization, 365, *erratum*, 539
  Smoke Abatement in—Conference in Bournemouth (Prof. R. J. Sarjant), 863
  Statistics of Petroleum Products in (Petroleum Information Bureau), 241
  Visit of Russian Scientists to (Arranged by the Royal Society and the Soviet Relations Committee of the British Council), 954
  Water Pollution Research in, 106
  Water Resources and Water Requirements in, 908

Britain from 1870 to the Present Day : Higher Civil Servants in (R. K. Kelsall), *review* by R. Brightman, 665
British Agricultural Contractors Association, and others : First National Crop Protection Conference (Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture), 1203
British Agricultural Delegation to visit the U.S.S.R., 491
British Agricultural Engineers, Institution of : New Premises, 1003
  Inauguration of a Western Centre, 1003
British Association for the Advancement of Science : Presidential Address, Science and the Scientist (Sir Robert Robinson), 433
  Summaries of Addresses of Presidents of Sections, 439
  Presidential Address to Section A, Mathematics and Physics (Prof. N. F. Mott), 439
  Presidential Address to Section B, Chemistry (Sir Alexander Todd), 440
  Presidential Address to Section C, Geology (W. N. Edwards), 441
  Presidential Address to Section D, Zoology (Prof. F. W. Rogers Brambell), 441
  Presidential Address to Section E, Geography (J. N. L. Baker), 442
  Presidential Address to Section G, Engineering (Dr. S. F. Dorey), 442
  Presidential Address to Section H, Anthropology and Archæology (Dr. D. B. Harden), 443
  Presidential Address to Section I, Physiology (Dr. R. S. Creed), 443
  Presidential Address to Section J, Psychology (Alex Rodger), 444
  Presidential Address to Section K, Botany (Prof. K. Mather), 445
  Presidential Address to Section L, Education (J. F. Wolfenden), 446
  Presidential Address to Section M, Agriculture (W. B. Mercer), 446
  Presidential Address to Section X, Assembly of Corresponding Societies (Ritchie Calder), 447
  Election of Sir Raymond Priestley as president, 490
  Section A (Physics) : Discussion on Flames and Combustion, 771
  Section B (Chemistry) : Discussion on Sorting Molecules, 1188
  Sections C (Geology) and G (Engineering) : Symposium on Soil Mechanics, Geology and Civil Engineering, 715
  Section D (Zoology) : Symposium on Migration, 772
  Section D (Zoology) : Discussion on Immunity and Development, 852
  Section D (Zoology) : Discussion on the Importance of Larval Characters in Classification, 911
  Sections D (Zoology), B (Chemistry) and C (Geology) : Discussion on Marine Organisms and Biogeochemistry, 818
  Sections D (Zoology) and I (Physiology) : Discussion on Animal Movement, 1060
  Sections D (Zoology), I (Physiology) and J (Psychology) : Discussion on Genetics and Medicine, 532
  Section H (Anthropology and Archæology) : Discussion on Disposal of the Dead, and Beliefs in an After-Life, 809
  Section I (Physiology) : Discussion on Lighting and Vision, 717
  Section I (Physiology) : Discussion on Dust and Health in Industry, 761
  Section I (Physiology) and J (Psychology) : Discussion on Cerebral Activity, 576
  Section J (Psychology) : Symposium on Semantics, 673
  Section K (Botany) : Discussion on the Metabolism of Nitrogen in Plants, 904
  Sections K (Botany) and K* (Forestry) : Discussion on Fungi in Forests, 671
  Sections K (Botany) and M (Agriculture) : Discussion on Trace Elements and Plant Growth, 621
  Sections K (Botany) and M (Agriculture) : Symposium on Genetics and Plant Breeding, 719
  Section L (Education) : Discussion on Man and his Machines, 633
  Section L (Education) : Discussion on the Education of the Physicist, 678
  Section M (Agriculture) : Discussion on Fertility in Farm Animals, 620
  Section M (Agriculture) : Discussion on the Utilization and Evaluation of Grassland, 764
  Committee for Seismological Investigations : Sixtieth Annual Report (1954–55), 679
British Association for the Advancement of Science (Division for Social and International Relations of Science) : Conference on Land Use in Britain, 338
British Atomic Scientists : Visit of, to the U.S.S.R., 954
British Chemical Manufacturers, Association of : Booklets on Work Study and some of the Results, 642
  British Chemicals and their Manufacturers (1955), 677
British Chemicals and their Manufacturers (Association of British Chemical Manufacturers), 677
British Coal Utilization Research Association : Fourth Coal Science Lecture (Sir Cyril Hinshelwood), 586
British Colonial University Institutions, 675
British Colonies : Development and Welfare in the, 1158
British Commonwealth : Colonial Territories of the (Report for 1954–55), 639
British Commonwealth, Association of Universities of the : Commonwealth Inter-University Conference, 194
  Report of the Proceedings of the 1954 Conference of the Universities of Great Britain and Northern Ireland, 195
  Appendixes II and III of the Commonwealth Universities Yearbook 1955, Postgraduate Awards in British Commonwealth Universities, 1199
British Commonwealth and Empire Lecture of the Royal Aeronautical Society (Dr. J. J. Green), 493
British Commonwealth Affairs, No. 10 : Foundations of Freedom—the New Universities Overseas (Sir James Duff), 675
British Commonwealth Universities : Postgraduate Awards in (Association of Universities of the British Commonwealth), 1199
British Cotton Industry Research Association : Retirement of Dr. F. C. Toy as director of research, 1150
  Appointment of Dr. D. W. Hill as director of research, 1150
British Council (Soviet Relations Committee), (Royal Society and the) : Visit of Russian Scientists to Britain arranged by, 954
British Empire Cancer Campaign : Thirty-second Annual Report (1954), 578
  Grant of £450 a year to the Department of Organic Chemistry, Queen's University of Belfast, for work on the synthesis of colchicine, 1104
British Food Manufacturing Industries Research Association : Open Day, 196
British Gelatine and Glue Research Association : Research Panel Meeting (A. G. Ward), 105
British Graduates in Science and Technology : Scholarships to (Massachusetts Institute of Technology), 381
British Hat and Allied Feltmakers Research Association : Seventh Annual Report, 431
British Industries, Federation of (Industrial Research Committee) : Fourth Conference of Industrial Research Directors and Managers (The Education and Training of Graduate Staff for Industrial Research), 141
British Industries, Federation of (North Midland Regional Council), and the Regional Advisory Council for the Organization of Further Education in the East Midlands : Report of the Conference on Industry and Technical Education, 821
British Industries Fair : Atomic Energy Exhibit at the, 956
British Industry : Adoption of the Unified Screw Thread by (Conference at the British Standards Institution), 62
  Standards in (Political and Economic Planning, Broadsheets 381 and 382), 1061
British Insecticide Manufacturers, Association of, and others : First National Crop Protection Conference (Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture), 1203
British Institute of Management : Conference on the Impact of Science on Management in the Future, 677, 1108
British Institute of Radiology : Annual Congress and Exhibition, 1056
British Institute of Recorded Sound, in conjunction with the Department of Extra-Mural Studies of the University of London : Lectures by Eric Simms on the Language of Birds and other Animals, 677
British Institution of Radio Engineers : Abstracts of Papers which have appeared in the *Journal of the British Institution of Radio Engineers* over the past 15 Years, 381
  Premium Awards for 1954, 536
British Instrument Industries Exhibition 1955, 140
British Insulated Callenders Cables Co., Ltd., and others : Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
British Isles : Earth Tilts in the, connected with Far Distant Earthquakes (Prof. R. Tomaschek), 24
*British Journal of Applied Physics* (edited by Dr. H. R. Lang), Vol. 5 (1954), and Supplement No. 3, The Physics of Particle Size Analysis, *review*, 1091
*British Journal of Radiology* : Supplement No. 6, Recommendations of the International Commission on Radiological Protection (Revised December 1954), 375
British Libraries : Subject Specialization and Co-operative Book Purchase in (K. G. Hunt), 62
British Mathematical Colloquium : Seventh, 58
British Mosses and Liverworts (Dr. E. Vernon Watson), *review* by Dr. A. Allsopp, 1237
British Museum (Natural History) : Appointment of Dr. Helen Marguerite Muir-Wood as deputy keeper in the Department of Geology, 241
  Recent work of the, 815
  Appointment of Dr. George Taylor as a deputy chief scientific officer, 908
  Appointment of Dr. W. E. China as keeper of the Department of Entomology, 908
  Natural History Lectures and Films during the Christmas holidays for junior audiences, 1153
  Appointment of J. P. Doncaster as a deputy keeper in the Department of Entomology, 1249
British Museums and Art Galleries : A Museums Calendar for (Museums Association), 240
British Nuclear Energy Conference : Meeting in London, 956
British Occupational Hygiene Society : Conference on the Use and Abuse of Protective Equipment, 448, 1251
British Oxygen Co., Ltd. : Award of Fellowships for Postgraduate Research, 539
  Gift of £1,000 a year for seven years to the University of Oxford, for the continuation of low-temperature research in the Clarendon Laboratory, 769
British Petroleum Co., Ltd., and others : Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
British Portland Cement Manufacturers, Ltd., and others : Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860

British Postgraduate Medical Federation : Lectures on the Scientific Basis of Medicine, Vol. 2 (1952–53), Vol. 3 (1953–54), *review* by Dr. R. T. Grant, 803
British Railways : Science and (T. M. Herbert), 20
British Rubber Development Board : Annual Report for 1954, 632
British Scene : The Cleanliness of the, 491
British Scientific Instrument Research Association : Bibliographical Survey of Flexure Devices (P. J. Geary), 676
British Seismology during 1954–55 (Ernest Tillotson), 679
British Shipbuilding Research Association, and others : Symposium on the Use and Welding of Aluminium in Shipbuilding, 957
British Society for Research on Ageing : Discussion on Endocrinology and Ageing, 291
British Society of Rheology : Conference on Surface Rheology, 493, 819
  Discussion on Visco-elastic Behaviour, 61
British Standards Institution : Conference on the Adoption of the Unified Screw Thread by British Industry, 62
  Election of Sir Herbert Manzoni as chairman of the General Council, 862
  Re-election of Sir Roger Duncalfe as president, 862
  Election of Sir Stanley Rawson as chairman of the Engineering Divisional Council, 862
British Universities Film Council : Conference on the Film in Training and Research in Psychology and Psychological Medicine, 1109
British University System 1914–1954 (Sir Hector Hetherington), 522, 567
British Welding Research Association, and others : Symposium on the Use and Welding of Aluminium in Shipbuilding, 957
British-produced Radioisotopes : Prices of, 334
Brittle-star, *Ophiocomina nigra* : Secretion of a Highly Sulphated Acid Mucopolysaccharide by the (A. R. Fontaine), 606
Britton, Prof. Hubert T. S. : The University of Exeter, 899
Broadening of University Education, 1
Brock, Sir Russell : Pulmonary Circulation and Respiratory Function, 960
Brockelsby, C. F. : Applications of Ultrasonics, 387
Broda, Prof. E., and others : Distribution of Radiocarbon in Tobacco Mosaic Virus, 306
Brodie, Bernard B., and others : Identification and Pharmacological Properties of a Major Metabolite of Chlorpromazine, 1122
Bromberg, Philip A., and others : Identification of $N^2$-Methylguanine (2-Methyl-amino-6-hydroxypurine) as a Normal Constituent of Human Urine, 1217
Bronk, Dr. Detlev : Appointed chairman of the Board of the United States National Science Foundation, 1200
Bronks, Doris, and others : Influence of Cortisone on Connective Tissue—Epithelial Relations in Wound Healing, Hair Regeneration and the Pathogenesis of Experimental Skin Graft, 932
Bronowski, Dr. J. : Glossary of Coals, *review*, 184
  The Revolt against Reason (Science), 521
Bronzes (Treated) : Washing of (R. M. Organ), 817
Brooker, L. G. S. : Advances in Organic Chemistry, 761
Brookhaven National Laboratory : Conference on Statistical Aspects of the Nucleus (Proceedings of the), 631
Brooklyn Botanic Garden : Appointment of Dr. Walter R. Tulecke as research associate, 862
  Appointment of Miss Gunny Larsson for one year as Ellen Eddy Shaw Fellow, 862
  Appointment of Miss Charlotte Mentges to the educational staff, 862
Brooks, Dr. B. T., and Dunstan, Dr. A. E. : The Science of Petroleum, Vol. 5, Part 3, Refinery Products, *review* by Lieut.-Colonel S. J. M. Auld, 522
Brooks, R. : Electric Traction (Christmas Lecture for School Children at the Institution of Electrical Engineers), 1056
Brotzen, Dr. F. : Occurrence of Vertebrates in the Triassic of Israel, 404
Broughton, F. S. O. : Appointed secretary of the Development Commission, 632
Brouwer, Prof. L. E. J. : Elected an Honorary Fellow of the Royal Society of Edinburgh, 56
Brown, D. Rainy : Sodium in Empty Ether Bottles, 448
Brown, Dr. G. E. : Appointed lecturer in mathematical physics at the University of Birmingham, 862
Brown, Dr. Geoffrey L., and Martin, Dr. Angela V. : Fractionation of the Deoxyribonucleic Acid of T2r Bacteriophage, 971
Brown, Dr. Geoffrey L., and others : Macromolecular Weight and Size of Deoxypentose Nucleic Acids, 161
Brown, G. Spencer : Information Theory, 773
Brown, J. K. : Coal Science, 104
Brown, Dr. J. R. : Physiology in Cold Climates, *review*, 849
Brown, L., and others : Structure of Polyglycine, 396
Brown, P. E. : Appointed geologist, Tanganyika, 910
Brown, R. F. C. : Awarded an Overseas Scholarship for 1955 by the Royal Commission for the Exhibition of 1851, 58
Brown, Dr. R. H. J. : Animal Movement, 1061
Brown, W. T. : Awarded the Marconi Premium for 1954 of the British Institution of Radio Engineers, 536
Browne, B. C. : Geological, Dynamical and Palaeomagnetic Aspects of Polar Wandering, 425
  Geophysical Research in North America, *review*, 943
Bruce, D. : Psychology and the Film, 1109
Bruce, Dr. V. G., and others : Turbidimetric Measurement on Synchronized *Salmonella typhimurium* Cultures, 563
Bruce-Mitford, R. L. S. : Functions of National and Local Museums as regards the Acquisition of Material, 246
*Brucella* Vaccine : Concentration of (Dr. G. C. van Drimmelen), 469
Bruckner, Academician Gyozó : Awarded a first-class Kossuth Prize for Research, 14
Brues, Prof. C. T. : *Obituary* by Dr. George Salt, 628
Brues, Prof. C. T., and others : Classification of Insects, new edition, *review* by Dr. H. E. Hinton, 46
Brumby, Peter J. (Elliott, Miss Gillian M., and) : Rate of Milk Secretion with Increasing Interval between Milking, 350
Brunskill, R. T., and others : A Variable Dosage Sprayer for Agricultural Experiments, 472
Brunt, Sir David : Magneto-Hydrodynamics, 234
  Exploration of the Earth's Upper Atmosphere using High-Altitude Rockets—British Research Programme, 282
Bruun, Dr. Anton : Elected an Honorary Fellow of the Royal Society of Edinburgh, 56
Bryce-Smith, Dr. D. : Organo-Metallic Compounds, 60
Bryden, R. : The Revolt against Reason (The Attitude of the Younger Generation in the Universities), 521
Bryson, Dr. Vernon : Appointed programme director for genetic and developmental biology in the Division of Biological and Medical Sciences of the National Science Foundation, Washington, 770
Bubble Chamber (Dr. C. Dodd), 142
Buckingham, A. D. : Awarded a senior studentship for 1955 by the Royal Commission for the Exhibition of 1851, 58
Budden, K. G. : Physics of the Ionosphere, 732
Buffalo : Urinary Oestrogens in the, as measured Chemically (Dr. E. S. E. Hafez and T. Attar), 796
Building Research Station, Garston, Watford : Open Days for Engineers, 337
Bull, Dr. C. B. B. : Appointed to a fellowship in geophysics in the University of Birmingham, 1055
Bull Spermatozoa (Live and Dead) : A New Method for Counting (A. D. Bangham and J. L. Hancock), 656
Bullard, Sir Edward : The Education and Training of Graduate Staff for Industrial Research, 141
  Origins of the Torsion Balance, *review*, 228
  Magneto-Hydrodynamics, 234
  An Atomic Standard of Frequency and Time Interval—Definition of the Second of Time, 282, *erratum*, 381
Bullen, Prof. K. E. : An Introduction to the Theory of Seismology, second edition, *review* by Dr. R. Stoneley, 992
Bullock, Dr. G. : Appointed lecturer in physical metallurgy at the University of Birmingham, 862
Bullock, J. A. : Appointed scientific officer, entomologist, Kenya, 1248
Bundy, Dr. F. P., and others : Man-made Diamonds, 51
Burcham, J. N. (Hearmon, R. F. S., and) : Specific Heat and Heat of Wetting of Wood, 978
Burcham, Prof. W. E. : High-Energy Nuclear Physics—Physical Society's Summer Meeting, 371
  Niels Bohr Birthday Essays, *review*, 1186
Burda, E. J. (edited by) : Applied Solar Energy Research, *review* by Dr. H. Heywood, 804
Burger, H. C., and others (edited by Kronig, R., in collaboration with) : Textbook of Physics (translated from the third Dutch edition), *review* by Prof. G. O. Jones, 184
Burgoyne, Dr. J. H. : Appointed to the University of London readership in chemical engineering at the Imperial College of Science and Technology, 57
Burkard, Dr. O. : Solar Eclipses and the Ionosphere, 948
Burke, Edward : Air Pollution, 85
Burke, John J., and others : Titanium in Industry, *review* by P. L. Teed, 804
Burkitt, Miles : Disposal of the Dead, and Beliefs in an After-Life, 809
Burma : Wild Life Preservation in (U. Tun Yin), 585
Burman, Dr. N. P. : Methods of Detecting and Counting Antagonistic Micro-organisms in Soil, 730
Burn, Dr. J. H. : Problems of International Concern in the Biological Sciences, 242
Burnett, Dr. J. H. : Appointed to the chair of botany in the University of St. Andrews, 1002 ; work of, 1002
Burrows, Dr. E. M. : Botany of Seaweed, 1107
Burrows, Harold : *Obituary* by Dr. E. S. Horning, 859
Burström, Prof. Hans : Plant Growth Substances, 530
Burt, Sir Cyril : *Obituary* of Prof. J. C. Flugel, 533
Burt, P. S. : Cavitation in Hydrodynamics, 809
Burton, Prof. Alan A., and Edholm, Prof. Otto G. : Man in a Cold Environment, *review* by Dr. J. R. Brown, 849
Burton, Prof. D. : The Fundamentals of the Chemistry of Tanning Processes, 587
Burton, Prof. D., and others : Apparent Transformation of Collagen Fibrils into 'Elastin', 966
Burton, M. : Chemical Effects of Ionizing Radiation, 198
Bus Services : Local Accessibility, the Hinterlands of Towns and other Centres as determined by an Analysis of (compiled by the Ministry of Housing and Local Government), Sheet 1, Scotland and N. England; Sheet 2, the Remainder of England and Wales, 151
Busch, Prof. G. : Intermetallic Semiconductors, 342
Bush (Vannevar) Fellowships in Earth Sciences (Massachusetts Institute of Technology and the Carnegie Institution of Washington), 1102
Bushnell, Dr. G. H. S. : Disposal of the Dead, and Beliefs in an After-Life, 810
Busnel, R. G., and Degrois, M. : Applications of Ultrasonics, 387
Busvine, Dr. J. R. : A New Monograph on DDT, *review*, 943
Butement, Dr. F. D. S. : High-Energy Nuclear Physics, 372
  Appointed senior lecturer in radiochemistry in the Department of Inorganic and Physical Chemistry, University of Liverpool, 448
Butler, Dr. C. C. : Awarded a Charles Vernon Boys Prize for 1956 of the Physical Society, 241
Butler, D. H. : Awarded a Mond Nickel Fellowship, 770
Butler, Edward B. : Counting Tritiated Water at High Humidities in the Geiger Region, 1262
Butler, Dr. P. M. : Appointed to the University of London readership in zoology at the Royal Holloway College, 957
Butterworths Scientific Publications and Verlag Chemie : Documentation of Spectra by Punched Cards, 724
Buttiaux, R., and Beerens, H. : Food Microbiology and Public Health, 374
Butts, Allison (edited by) : Copper, *review* by A. R. Bailey, 526
Buxton, E. W. (Last, F. T., and) : Photoreactivation of *Botrytis fabae* Sardiña measured by a Local-lesion Technique, 655
Buxton, Prof. Patrick A. : The Natural History of Tsetse Flies, *review* by Dr. T. A. M. Nash, 755
Byers, Horace R. (edited by) : Thunderstorm Electricity, *review* by Dr. J. Alan Chalmers, 573

CABOT, John : The Last Voyage of, and the Rock at Grates Cove (Prof. Arthur Davies), 996
Caesium (Radioactive) : Use of, for Cancer Treatment, [illegible]79
Caesium Resonator : An Atomic Standard of Frequency and Time Interval —A (Dr. L. Essen and J. V. L. Parry), 280

Caffyn, J. E., and Goodfellow, T. L. : Viscoelastic Behaviour, 61
  Electrical Effects associated with the Mechanical Deformation of Single Crystals of Alkali Halides, 878
Cairo University : Bulletin of the Faculty of Science, No. 30, Flora of Egypt, Vol. 3 (Vivi Täckholm and Mohammed Drar), 101
Calcareous Corpuscles in *Taenia saginata* : 'Kernechtrot' or Nuclear Fast Red in the Histochemical Detection of (A. B. Chowdhury, B. Dasgupta and H. N. Ray), 701
Calcification (Dystrophic), of Cardiac Muscle in Mice : Production of, by Hydrocortisone (Lowell L. Sparks, Werner Rosenau, Rex N. MacAlpin, Thomas A. Deane and Prof. Choh Hao Li), 503
Calcium : Colorimetric Determination of Micro Quantities of (T. T. Gorsuch and A. M. Posner), 268
Calcium in the Heart Tissue of Female $C_3H$ Mice : Deposition induced by Hydrocortisone of (Ardis Lostroh and Prof. Choh Hao Li), 504
Calcium Sulphate Gels : Nature of, in Ethylene Glycol (J. Cano Ruiz and Dr. Douglas M. C. MacEwan), 1169
Caldecott, Richard S. : Reduction in X-Ray Sensitivity of Seeds by Hydration, 306
Calder, P. Ritchie : Land Use in Britain, 338
  The Fragmentation of Science (Presidential Address to Section X (Assembly of Corresponding Societies) of the British Association for the Advancement of Science), 447
Calf : Comparison of Rectal and Deep Body Temperature in the (Dr. John Bligh), 402
Calibration of Temperature-measuring Instruments (National Physical Laboratory, Notes on Applied Science, No. 12), 822
Caliper for Measuring Photographs, X-Rays and Drawings (J. M. Tanner and R. H. Whitehouse), 1180
Callick, E. B. : Design of Electronic Devices for Production, 1060
Calls (Animal) : Characteristics of some (Dr. P. Marler), 6
Calvin, Prof. M. : The Photosynthetic Carbon Cycle (Bedson Club Lecture), 586
  Function of Carotenoids in Photosynthesis, 1215
Calvin, Prof. M., and others : Photosynthesis in Different Phyla, 432
Cama, Dr. H. R., and others : High-potency Vitamin $A_2$ Oils from Indian Freshwater Fish, 554
Cambridge : Veterinary Studies at (Prof. L. P. Pugh), 806
Cambridge Astronomical Symposium, 864
Cambridge Instrument Co., Ltd. : New Polarographic Laboratory opened by Prof. J. Heyrovsky, 1003
Cambridge Monographs in Experimental Biology, *review* by Prof. J. F. Danielli, 136
Cameron, A. R. : Library Resources in the Manchester Area, 198
Cameron, Dr. H. C. : Mr. Guy's Hospital, 1726–1948, *review* by Dr. E. Ashworth Underwood, 893
Cameron, J. F. : Measurement of Tritium in Water Samples, 1264
Cammack, R. H. : Seasonal Changes in Three Common Constituents of the Air Spora of Southern Nigeria, 1270
Campbell, Betty : *Obituary* of Prof. Gustave Magnel, 284
Campbell, D. D. : Appointed principal agricultural officer, Basutoland, 15
Campbell, Dr. D. R. : Use and Abuse of Protective Equipment, 1252
Canac, Prof. F. : Applications of Ultrasonics, 387
Canada : Biological Races of *Phytophthora infestans* in (K. M. Graham and H. N. Racicot), 432
  The Growth of Aeronautical Research in, during the Post-War Decade (Dr. J. J. Green), 493
  Radioactive Fall-out in Kingston, (R. L. Preston and Dr. B. G. Hogg), 459
Canadian Colloquium on Theoretical Physics (Dr. R. J. Eden), 588
Canadian Eastern Arctic Waters : Density Inversions in (Dr. M. J. Dunbar), 703
Canals within Pancreas Cells (Dr. Owen Lewis Thomas), 978
Cancer : Survey of, *review* by Prof. H. N. Green, 941
Cancer Campaign, British Empire : Thirty-second Annual Report (1954), 578
  Grant of £450 a year to the Department of Organic Chemistry, Queen's University of Belfast, for work on the synthesis of colchicine, 1104
Cancer Research : Progress of, 578
Cancer Treatment : Use of Radioactive Caesium for, 379
Cane, Violet (Gregory, R. L., and) : A Statistical Information Theory of Visual Thresholds, 1272
Cannon, Prof. H. Graham : Aquaria in Museums, 246
Cannon, Dr. J. R., and others : Structure of Vitamin $B_{12}$—The Structure of Vitamin $B_{12}$ and its Hexacarboxylic Acid Degradation Product, 328
Cant, E. M., and others : Structure of Polyglycine, 396
Canterbury University College, Christchurch : Appointment of Prof. F. J. Llewellyn as rector, 725
'Capillary Resistance' (Lowered), after Iontophoresis of Lysergic Acid Diethylamide (E. L. Blair, Mavis Wakefield, G. L. C. Ingram and P. Armitage), 563
Caplin, S. M., and others : Growth Factors and Tumorous Growth in Coconut Milk, 537
Capper, P. L. : Soil Mechanics, Geology and Civil Engineering, 715
Carasso, J. I. : Chemical Aspects of Semi-conductors, 154
Carbon, of Coal (Sir Cyril Hinshelwood), 586
Carbon Cycle : The Photosynthetic (Prof. M. Calvin), 586
Carbon-13 Isotope Effects in the Decarboxylation of some Oxaloacetates (Dr. E. Gelles and Dr. R. I. Reed), 1262
Carbon Dioxide Analysis : Single-Breath Continuous (L. Feinmann, G. L. Leathart and G. B. Pendlenton), 739
Carbon Rods (Extruded) : Anisotropy of Effective Gas Diffusion Coefficients in (P. L. Walker, jun., Frank Rusinko, jun., and Emile Raats), 1167
Carbon Source in *Chlorella* : Manganese Requirement and (Prof. André Pirson and Ludwig Bergmann), 209
Carbon Tetrachloride : Effects of, on Mitosis (B. R. Seshachar and Miss Parvathi K. Nambiar), 796
Carbonaceous Substances (Fossil) : Coals and Bitumens and related (Dr. S. L. Tomkeieff), *review* by Dr. J. Bronowski, 184
Carbonyl : Contribution of Residues containing, to the Ultra-Violet Absorption of Lignins (Dr. D. C. C. Smith), 927
2-Carboxy-Pyrrole : Structural Relationship between Sialic Acid, Neuraminic Acid and (Dr. A. Gottschalk), 881
Cardiac Muscle in Mice : Production of Dystrophic Calcification of, by Hydrocortisone (Lowell L. Sparks, Werner Rosenau, Rex N. MacAlpin, Thomas A. Deane and Prof. Choh Hao Li), 503
Cards (Punched) : Documentation of Spectra by (Butterworths Scientific Publications and Verlag Chemie), 724
Carelli, V., and others : Sorption Chromatography of Polar Substances on Polyamides, 70
Carey, A. T. : Appointed assistant adviser on aborigines, Federation of Malaya, 195
Carilli, Dr. A., and others : Ferroverdin, a Green Pigment containing Iron produced by a Streptomycete, 645
Carnegie Institution of Washington : Retirement of Dr. George W. Corner as director of the Department of Embryology, 767
  Appointment of Prof. James D. Ebert as director of the Department of Embryology, 767
Carnegie Institution of Washington (Massachusetts Institute of Technology and the) : Vannevar Bush Fellowships in Earth Sciences, 1102
Carotenoids : Functions of, in Photosynthesis (Dr. Mary Griffiths, Dr. W. R. Sistrom, Dr. Germaine Cohen-Bazire and Prof. R. Y. Stanier), 1211 ; (Prof. M. Calvin), 1215
Carp Myogen : A Crystalline Component of, precipitating at High Ionic Strength (J. G. Henrotte), 1221
Carpenter, Prof. Frank M., and others : Classification of Insects, new edition, *review* by Dr. H. E. Hinton, 46
Carr, W. R. : Ascorbic Acid Content of Baobab Fruit, 1273
Carroll, Dr. K. K. : Ion-Exchange Chromatography in Alcohol, 398
Carruthers, Dr. J. N. : Awarded the Commemorative Medal of Prince Albert I of Monaco (the Manley-Bendall Prize) by the Oceanographical Institute of Monaco, 16, *erratum*, 58
Carruthers, Dr. W. : 1:8-Dimethyldibenzothiophen in a Kuwait Mineral Oil Fraction, 790
Carson, H. L. : Non-Destructive Testing, 386
Carson, M. S. : Appointed geologist, Cyprus, 1248
Carson, T. R. : Appointed to a Research Fellowship in electron physics at the University of Birmingham, 862
Carter, Prof. C. F. : The Reconciling Spirit and the Economic Order (Alex Wood Memorial Lecture of the Fellowship of Reconciliation), 239
Carter, Dr. C. O. : Genetics and Medicine, 533
Carter, Dr. E. G. : Lecture at the International Wool Textile Research Conference, Australia, 712
Carter, Dr. J. S. : Appointed chief inspector of Alkali, etc., Works, 817
Carter, Dr. S. A. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Cartwright, Major P. A. : Corrosion and Meteorology, 748
Cartwright, Miss P. M. : Plant Growth Substances, 530
Casein : Relationship between Orotic Acid and Animal Protein Factors of (R. Viviani, M. Marchetti, A. Rabbi and Prof. G. Moruzzi), 464
Cass, Dr. R. C. : Appointed lecturer in chemistry at the University of Sheffield, 910
Cass, W. G. : Automation in the Soviet Union, 293
  Theory of Adhesion, 495
Casselman, Dr. W. G. B. : Awarded a Senior Medical Research Fellowship by the National Research Council of Canada, 102
Cassels, J. M. : High-Energy Nuclear Physics, 372
Cassidy, W. A., and Segnit, Prof. E. R. : Liquid Immiscibility in a Silicate Melt, 305
Cassie, Dr. A. B. D., and Howitt, Dr. F. O. : The International Wool Textile Research Conference, Australia, 1955, 712
Cassinis, Prof. G. : Elected a *correspondant* for the Sections of Free Academicians and of the Applications of Science to Industry of the Paris Academy of Sciences, 16
Castor Hanglands Nature Reserve, 684
Cat-fish, *Clarias mossambicus* Peters. : Reproduction in the (P. H. Greenwood), 516
Catalysed by Extracts of the Silkworm, *Bombyx mori* L. : Studies on Transaminase and Decarboxylase (B. Bheemeswar), 555
Catalysis (edited by Paul H. Emmett), Vol. 1, Fundamental Principles (Part 1), Vol. 2, Fundamental Principles (Part 2), *review* by Dr. E. B. Maxted, 417
Catalysis (Heterogeneous) : Effect of Chelating Agents on (Alan Dobry), 266
Catalysis (Magnetic), of the Decarboxylation of Oxaloacetic Acid (Dr. E. Gelles), 925
Catalysis and related Subjects : Advances in (edited by W. G. Frankenburg, V. I. Komarewsky and E. K. Rideal), Vol. 6, *review* by Dr. E. B. Maxted, 417
Catarrh (Bovine Malignant) : Elementary Bodies in (D. Danskin), 518
Catcheside, Prof. D. G. : Appointed to a chair of microbiology in the University of Birmingham, 862
Catechin : Autoxidation of (Dr. D. E. Hathway and J. W. T. Seakins), 218
Caterpillars : An Electrified Barrier for (K. M. Doull), 842
Cathode (Hollow) : Measurements of Retarding Potential on the (Dr. A. W. Bright and J. S. Thorp), 1079
Cathode Arcs : Anode and (Dr. L. H. Germer and Dr. W. S. Boyle), 1019
Cathodes (Tungsten and Copper) : High-Pressure Glow-to-Arc Transitions with (W. L. Price, W. A. Gambling and Dr. H. Edels), 28
Cats (Young) : Long-term Transplants of Infantile Rat Pituitaries cultivated *in vitro* and Grafted into the Anterior Eye Chamber of (Dr. P. M. Martinovitch and D. V. Radivojevitch), 699
Catterall, Dr. J. A. : Fundamentals of Physical Metallurgy, *review*, 229
Cattle in Denmark : Congenital Porphyria in Swine and (S. K. Jørgensen and Dr. Torben K. With), 156
Cattle (Dairy) : Hypomagnesaemia in, and its Possible Relationship to Ruminal Ammonia Production (M. J. Head and J. A. F. Rook), 262
Cattle (Zebu), in Uganda : Œstrus in (D. H. L. Rollinson), 352
Cattle Hides and Goatskins : The Effect of certain Drying Conditions on the Putrefaction of (Dr. M. H. French and Dr. R. L. Sykes), 297, 725
Cattle Tick : Temporary Destocking of Pastures to aid Control of the (Dr. P. R. Wilkinson), 515
Causley, D., and Young, Prof. J. Z. : Counting and Sizing of Particles with the Flying-Spot Microscope, 453
Cavalli, G., and others : Deoxyribonucleic Acid Content of the Nucleus and Nuclear Volume, 311
Cavanagh, Peter : The Ishihara Test and Defects in Colour Vision, 816
Cavendish Laboratory, Cambridge : Award of 40,000 dollars by the Rockefeller Foundation of New York, to aid the researches on proteins for the Medical Research Council's unit, 1112
Cavitation in Hydrodynamics (Symposium at the National Physical Laboratory), 195, 381, 808

Cawood, Dr. W. : Appointed principal director of scientific research (air), Ministry of Supply, 632
Ceccato, Prof. S., and Maretti, Prof. E. : Information Theory, 774
Celander, Dr. Olov, and Mellander, Stefan : Elimination of Adrenaline and Noradrenaline from the Circulating Blood, 973
Celestial Radio Source at 242 Megacycles per Second : A Fluctuating (Prof. J. D. Kraus, H. C. Ko and D. V. Stoutenburg), 304
Cell : Ionizing Radiation and the (Prof. G. Pontecorvo), 1204
Cell (Animal) : Aspects of the, *review* by Dr. D. R. Newth, 664
Cell (Yeast) : Yeast Mitochondria—Mitochondria and Refractive Granules in the (Y. Yotsuyanagi), 1208
Cell Biology : Eighth International Congress for (International Society for Cell Biology), 105
Cell Biology, Society for : Election of Prof. P. J. Gaillard as president, 105
Cell Nuclei (Isolated) : Protein Synthesis in (Dr. V. G. Allfrey, Dr. A. E. Mirsky and Syozo Osawa), 1042
Cell Surface and Fertility in *Escherichia coli* (Dr. G. A. Maccacaro), 125
Cell Suspensions from Plant Roots for Cytological Studies : Preparation of (Shirley Hornsey), 744
Cells (Ehrlich Ascites Tumour) : Separation of, from other Cellular Elements (Prof. Per Eric Lindahl and George Klein), 401
Cells (Human Red) : Transformation of the *Lewis* Groups of (Mrs. Joan S. Sneath and P. H. A. Sneath), 172
Cells (Living), *in vitro* : Action of Ribonuclease on, and Synthesis of Deoxyribonucleic Acid (H. Firket, S. Chèvremont-Comhaire and Prof. M. Chèvremont), 1075
Cells (Nerve), of Insects : Golgi Bodies in (S. K. Malhotra), 886
Cells (Pancreas) : Canals within (Dr. Owen Lewis Thomas), 978
Cells (Red Blood), of Sheep : Genetic Control of Sodium and Potassium Concentrations in the (J. V. Evans and J. W. B. King), 171
Cells (Rous Fowl Sarcoma) : Site of Virus-like Particles in (M. A. Epstein), 784, *erratum*, 862
Cells and Societies (Prof. John Tyler Bonner), *review* by C. W. W., 992
Cellular Electrolytes and Adrenal Steroids (Dr. E. Sherwood Jones), 269
Cellular Elements : Separation of Ehrlich Ascites Tumour Cells from other (Prof. Per Eric Lindahl and George Klein), 401
Cellular Inheritance : Nucleus and Cytoplasm in (Prof. J. F. Danielli, Dr. L. J. Lorch, Dr. M. J. Ord and Miss E. G. Wilson), 1114
Cellulose and other Microfibrillar Substances : Fine Structure of (V. Balashov and Prof. R. D. Preston), 64
Cellulose Nitrate (Dr. Frank Douglas Miles), *review*, 896
Cement and Concrete Association : Gift of £900 to the Department of Civil Engineering, University of Leeds, for the salary of a lecturer, 1055
Central Advisory Water Committee : Resumption of meetings of the, 768
Appointment of Sub-Committees on the Water Resources and Water Requirements in Britain, 908
Central Africa, Institute for Scientific Research in : Report for 1952, 387
Central Africa (East and) : Research on the Tropical Swamps of, 536
Central Electricity Authority : Gift of £800 to the Department of Electrical Engineering, University of Birmingham, to continue research work on electrostatic precipitation of dust, 1055
Central Office of Information : Reference Pamphlet No. 2, The Commonwealth and Nuclear Development, 334
Centre National de Recherches Scientifiques : Conference on the Applications of Ultrasonics, 387
Centro Appenninico, Terminillo—Biological Research Station in the Apennines, 630
Cephalosporin *N* and Synnematin *B* : Identity of (Dr. E. P. Abraham, G. G. F. Newton, B. H. Olson, D. M. Shuurmans, J. R. Schenck, M. P. Hargie, M. W. Fisher and S. A. Fusari), 551
Ceppellini, Ruggero (Landy, Dr. Maurice, and) : Production of '*O* Inagglutinability' in Erythrocytes coated with Typhoid Vi and *O* Antigens, 1266
Ceramic Bodies : Expansion and Deterioration of (H. V. Hueber and Angela A. Milne), 509
Cerebral Activity (British Association for the Advancement of Science, Sections I (Physiology) and J (Psychology), Discussion on), 576
Cerebral Hypoxia (Isolated) : Effect of, and Hypercapnia on Sodium Excretion (M. Földi, A. G. B. Kovách and L. Takács), 120
Cerebrospinal Fluid (Normal Human) : A Study of, by the Immuno-Electrophoretic Method (Mme. K. Gavrilesco, Mlle. J. Courcon, Mlle. P. Hillion, J. Uriel, J. Lewin and P. Grabar), 976
Cerletti, A., and Rothlin, Prof. E. : Role of 5-Hydroxytryptamine in Mental Diseases and its Antagonism to Lysergic Acid Derivatives, 785
Cervix Uteri (Human) : Chromosome Number of (Dr. G. K. Manna), 354
Caesium-137 : Protection against Radiations from Radium, Cobalt-60 and (United States National Bureau of Standards, Handbook 54), 769
Cessation of Tillering in Young Grass Plants (Arthur Troughton), 514
Cestode, *Eubothrium crassum* (Bloch) : Maturation Divisions of the Ova in the Pseudophyllidean (Dilys Rawson), 167
Ceylon Pteridophyta : Cytology and Taxonomy of (I. Manton and W. A. Sledge), 631
Chadwick, Sir James : Elected an Honorary Fellow of the Institute of Physics, 16
Chain, Prof. E. B., and others : Ferroverdin, a Green Pigment containing Iron produced by a Streptomycete, 645
*Chainia*, a New Genus of the Actinomycetales (Dr. M. J. Thirumalachar), 934
Chaldecott, J. A. : Heat and Cold, 538
Temperature Measurement and Control, 538
Challinor, Dr. S. W., and Daniels, N. W. R. : Fat Production by Inositol-deficient Yeast, 1267
Chalmers, Dr. J. Alan : Thunderstorm Electricity, *review*, 573
Chambard, Prof. P. : The Properties of Leather, 587
Chamberlain, Dr. H. N. : Title of reader in textile industries in the University of Leeds conferred on, 862
Chambers, D., and others : Awarded the Brabazon Premium for 1954 of the British Institution of Radio Engineers, 536
Chambers, D. W. (Kandiah, K., and) : Awarded a Premium by the British Institution of Radio Engineers, 536
Chamosite : Mineralogy and Crystal Structure of (R. F. Youell), 560
Champion, Prof. H. G. : University of Oxford School of Forestry, 721
Chance, Dr. B. : Physical Chemistry of Enzymes, 960
Chance, Dr. B., and Williams, Dr. G. R. : A Method for the Localization of Sites for Oxidative Phosphorylation, 250
Chance, M. R. A. : Film on Social Behaviour in Rhesus Monkeys, 341
Chandrasekhar, Prof. S. : Magneto-Hydrodynamics, 234
Theoretical Physics, 588
Change : The Statistics of, *review* by Dr. D. R. Cox, 275
Change from Cytoplasmic to Nuclear Control : An Apparent, of a Form of Chlorophyll Deficiency in *Gossypium arboreum* L. (Bhola Nath), 316
Changes in Animal Tissue after Hydrocortisone Administration—Production of Dystrophic Calcification of Cardiac Muscle in Mice by Hydrocortisone (Lowell L. Sparks, Werner Rosenau, Rex N. MacAlpin, Thomas A. Deane and Prof. Choh Hao Li), 503 ; Deposition induced by Hydrocortisone of Calcium in the Heart Tissue of Female $C_3H$ Mice (Ardis Lostroh and Prof. Choh Hao Li), 504
Changes in Lunar Topography (Dr. H. P. Wilkins), 447
Changes of Protein Structure in the Rat Brain during Physical Exertion : A Source of Ammonia and (Dr. R. Vrba), 117
Chapiro, A. : Chemical Effects of Ionizing Radiation, 197
Chapman, C. B. : Awarded a postgraduate research scholarship (third-year renewal) by Courtaulds' Scientific and Educational Trust Fund, 770
Chapman, Dr. D. : Infra-Red Spectra and the Polymorphism of Glycerides, 216
Chapman, Dr. N. B. : Appointed reader in organic chemistry in the University of Southampton, 336
Chapman, Prof. S. : Solar Eclipses and the Ionosphere, 947
Characteristics of some Animal Calls (Dr. P. Marler), 6
Characterization of a Second Pigment in Strawberries (Dr. A. Lukton, Dr. C. O. Chichester and Prof. G. Mackinney), 790
Characterization and Total Recovery of the Component Proteins of a Deoxyribonucleoprotein (Dr. G. Toennies and B. Bakay), 696
Characters : Apparent Reciprocal Exchange of, between the *Mel* and *NWS* Strains of Influenza A Virus in the Brain of One-day Old Mice (Dr. K. B. Fraser), 212
Chargaff, Erwin, and Davidson, J. N. (edited by) : The Nucleic Acids, *review* by Dr. E. Stedman, 801
Charge acquired by Powdered Salts on moving over Metal Surfaces (Dr. B. A. Cooke), 264
Charlesby, A., and Alexander, P. A. : Chemical Effects of Ionizing Radiation, 197
Charlesworth, D. : Elected by the Salters' Company to be a Salters' Scholar for 1955–56, 195
Chater, G. P., and Jary, Miss C. L. : Surveys of Hop Picking Machines, 388
Chatt, Dr. J. : Organo-Metallic Compounds, 59
Chatterjee, Dr. D. : Appointed superintendent of the Indian Botanic Garden, 238 ; work of, 238
Chatterjee, M. L., and Himsler, H. F. : Anti-acetylcholine and Anti-histamine Actions of the Total Alkaloids of *Rauwolfia serpentina* Benth, 701
Chaubal, A. S., and others : Minor Oscillations of Magnetographs, 876
Chaucer Holograph ? : A, *review* by Sir Harold Spencer Jones, 415
Chaudhri, Prof. Rafi Mohammed, and others : Anomalies in the Cosmic-Ray Shower Curves for Lead, 876
Chelating Agents : Effect of, on Heterogeneous Catalysis (Alan Dobry), 266
Chemical Aspects of Semiconductors (Royal Institute of Chemistry Symposium on), 153
Chemical Composition of the Larger Seaweeds (D. J. Wort), 1198
Chemical Discoveries (Lavoisier's) : Further Studies of, *review* by W. A. Smeaton, 896
Chemical Effects of Ionizing Radiation (Société de Chimie Physique Fifth Annual Meeting), 197
Chemical Engineers, Institution of, and the Society of Instrument Technology : Joint Conference on Automatic Control in the Process Industries, 241
Chemical Engineers, Institution of, and others : First meeting of the British Nuclear Energy Conference, 956
Chemical Industry : American (Williams Haynes), Vol. I, Background and Beginnings, 1608–1910 ; Vol. 5, Decade of New Products, 1930–1939, *review*, 618
Chemical Industry, Society of (Documentation Committee) : Publication in *Chemistry and Industry* of periodical lists of Amendments to the third edition of the 'World List of Scientific Periodicals', 102
Chemical Industry, Society of, and others : Symposium on Organo-Metallic Compounds, 59
Symposium on the Use of Radioactive Materials in Biological Assay, 427
Chemical Industry, Society of (Pesticides Group), and others : First National Crop Protection Conference (Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture), 1203
Chemical Institute of Canada (Biochemistry Division) : Symposium on the Chemistry and Biology of Phospholipids, 241
Chemical Laboratories (Physical and) : X-Ray Diffraction in, *review* by Dr. A. Guinier, 710
Chemical Manufacturers (British), Association of : Booklets on Work Study and some of the Results, 642
British Chemicals and their Manufacturers (1955), 677
Chemical Microbiology at Oxford, 1002
Chemical Problems : Applications of Spectroscopy to, and on Intermolecular Forces and the Properties of Fluids (Summer School at the University of Cambridge), 1104
Chemical Profession : Public Relations for the (American Chemical Society News Service brochure), 908
Chemical Research Laboratory, Teddington : Open Days, 241, 857
Report for 1954, 382
Chemical Society : Grants for Research in Chemistry, 381
Corday-Morgan Medal for 1953, 1153
Chemical Society, and others : Symposium on Organo-Metallic Compounds, 59
Symposium on the Use of Radioactive Materials in Biological Assay, 427
Chemical Technology at the University of Edinburgh, 583
Chemical Treatments : Responses of a Fern Apex to Direct (Prof. C. W. Wardlaw), 1098
Chemical University, Veszprém, and others : First Hungarian–Czechoslovak Polarographic Conference, 865
Chemical and Enzymatic Oxidations of Glucose Anomers : Specificity in (Dr. Ronald Bentley), 870
Chemical, Metallurgical and General Technological Sessions at Geneva Peaceful Uses of Atomic Energy—(Dr. R. Spence), 574
Chemically : Urinary Œstrogens in the Buffalo as measured (Dr. E. S. E. Hafez and T. Attar), 796

Chemicals (Agricultural) : Risks to Wild Life of, 380
Chemicals (British), and their Manufacturers (Association of British Chemical Manufacturers), 677
Chemicals (Toxic), in Agriculture—Risks to Wild Life, 380
Chemie, Verlag (Butterworths Scientific Publications and) : Documentation of Spectra by Punched Cards, 724
Chemie in wässerigen Systemen : Grundlagen der analytischen Chemie und der (Prof. F. Seel), *review* by Dr. Albert Wassermann, 1137
Chemie (analytischen) : Grundlagen der, und der Chemie in wässerigen Systemen (Prof. F. Seel), *review* by Dr Albert Wassermann, 1137
Chemiluminescence in the Decomposition of the Propyl Nitrates (Dr. Peter Gray and M. W T. Pratt), 1171
Chemistry at the Imperial College, London, 285
Chemistry at Nottingham, 535
Chemistry at the Royal Holloway College, London, 1197
Chemistry at University College, London, 191
Chemistry : Peaceful Uses of Atomic Energy—Reactor Physics and (Dr. J. Gaunt and D. J. Littler), 619
  Research in (Chemical Society Grants for), 381
Chemistry of the Gram-Staining Process (Prof. M. Stacey), 1145
Chemistry of Insulin, 1001 ; (Dr. F. Sanger), 586
Chemistry of Naphthalenes and Sterols, *review* by Dr. J. W. Cook, 523
Chemistry of Naturally Occurring Pyrones (University College, Dublin, and the Institute of Chemistry of Ireland, Symposium on), 637
Chemistry of Tanning Processes : The Fundamentals of the (Symposium at the Fourth Conference of Leather Chemists' Societies), 587
Chemistry, Department of (Federation of Malaya) : Appointment of A. L. Biggs as chief chemist, 16
Chemistry, Royal Institute of : Symposium on Chemical Aspects of Semiconductors, 153
Chemistry, Royal Institute of (Manchester and District Section) : Exhibition of Laboratory Apparatus and Techniques with particular reference to Instrumentation, 1104
Chemistry, Royal Institute of, and others : Symposium on Organo-Metallic Compounds, 59
  Symposium on the Use of Radioactive Materials in Biological Assay, 427
Chemistry of Ireland, Institute of (University College, Dublin, and the) : Symposium on the Chemistry of Naturally Occurring Pyrones, 637
Chemistry (Analytical), Society for (Biological Methods Group) : Conference on Biological and Microbiological Methods of Estimating Vitamin $B_{12}$, 384
Chemistry (Analytical), Society for, and others : Symposium on the Use of Radioactive Materials in Biological Assay, 427
Chemistry (Analytical Inorganic) : Principles of, *review* by Dr. Albert Wassermann, 1137
Chemistry (Applied) · First International Congress on Documentation of, 956
Chemistry (Inorganic) : Comprehensive (edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted), Vol. 2, Copper, Silver, Gold (J. W. Laist) ; Vol. 3, The Halogens (Prof. Robert C. Brasted), *review* by H. A. C. McKay, 229
  Treatise on, *review* by H. A. C. McKay, 229
Chemistry (Natural Product) : The Philosophy of, *review* by Prof. D. H. R. Barton, 1236
Chemistry (Organic) : Elsevier's Encyclopaedia of (edited by F. Radt), Series 3, Carboisocyclic Condensed Compounds, Vol. 12B, Naphthalene (A) Compounds containing One Naphthalene Nucleus—Oxo-Derivatives of the Naphthoic Acids, Naphthalenepolycarboxylic Acids ; Vol. 14, Supplement, Nor-Steroids, Steroids—Hydrocarbons, Halogen, Nitrogen and Unsubstituted Monohydroxyl Compounds (edited by A. Georg with the assistance of M. Georg-Plant), *review* by Dr. J. W. Cook, 523
  Theoretical, *review* by Dr. P. B. D. de la Mare, 991
  Theoretical Principles of (Prof. Walter Hückel), Vol. I (translated from the corrected seventh German edition by Prof. F. H. Rathmann), *review* by Dr. P. B. D. de la Mare, 991
Chemistry (Physical), at Sheffield, 378
Chemistry (Physical), in the University of the Witwatersrand, 629
Chemistry (Physical) : The Relation between Theory and Experiment in (Prof. E. A. Guggenheim), 586
Chemistry (Physical), of Enzymes (Faraday Society Discussion on), 958
Chemistry (Physical), of the Silicates (Wilhelm Eitel), *review* by Dr. R. C. Mackenzie, 47
Chemistry (Pure and Applied) : Fourteenth International Congress of, 58, 759
Chemistry (Pure and Applied), International Union of : Eighteenth Conference, 58
  Approval of the recommendation of the Commission on Nomenclature in Inorganic Chemistry that Element 101 be named Mendelevium, symbol Mv, 586
Chemistry (Radiation), of Solutions (M. Ebert and P. Howard-Flanders), 197
Chemistry (Textile), at Manchester, 430
Chemistry Research Board · Report of the, with the Report of the Director of the Chemical Research Laboratory, for the Year 1954, 382
Chemistry, Biochemistry and Isotopic Tracer Technique (Dr. G Popják), 193
Chemistry and Biology of the Nucleic Acids, *review* by Dr. E. Stedman, 801
Chemistry and Biology of Phospholipids (Biochemistry Division of the Chemical Institute of Canada Symposium on), 241
Chemistry and Inheritance of Flower Colour in the Dahlia (Dr. E. C Bate-Smith, Dr T. Swain and Dr. C. G. Nordström), 1016
Chemistry, Technology and Industry :. Peaceful Uses of Atomic Energy—Radioisotopes in (Dr. Henry Seligman), 854
Chemists' Club of New York : Election of Dr. Otto Maass as an Honorary Member, 1005
Chemotherapy . Modern Trends in (Sir Charles Harington), 420
Chemotherapy of *Eimeria tenella* : Synergism in the (L. P. Joyner and S. Brian Kendall), 975
Cherry, Dr. E. Colin : Information Theory—Third London Symposium, 773
Cherry, Dr. E. Colin, and others : Experiments on the Complete Suppression of Stammering, 874
Cherwell, Lord . Elected a correspondant for the Sections of Free Academicians and of the Applications of Science to Industry of the Paris Academy of Sciences, 16
Chesterman, W. D. : Cinematography in Scientific Research, 726
Chesters, Prof. C. G. C : Fungi in Forests, 672
  Algal Chemistry, 1106
Cheveley, Stephen : Appointed chairman of the Governing Body of the Foot-and-Mouth Disease Research Institute, 677
Chèvremont, Prof M., and others · Action of Ribonuclease on Living Cells *in vitro* and Synthesis of Deoxyribonucleic Acid, 1075
Chèvremont-Comhaire, S., and others : Action of Ribonuclease on Living Cells *in vitro* and Synthesis of Deoxyribonucleic Acid, 1075
Chichester, Dr. C. O., and others : Characterization of a Second Pigment in Strawberries, 790
Chick Embryo · Transfer of Proteins from the Yolk to the (A. M. Schechtman and Patricia F. Knight), 786
Chick Embryos · Skull Development in, after Ablation of One Eye (A. d'A. Bellairs), 658
Child : The Handicapped, 389
Children (School) Christmas Lectures for, 1056
Chilean Government (United Nations Food and Agriculture Organization, in co-operation with the) · Trials with a Protein-rich Fish Flour, 101
Chimie Physique, Société de : Fifth Annual Meeting (Chemical Effects of Ionizing Radiation), 197
Chimpanzee : Supra-sternal Ossicles in Primates other than Man—some Isolated Cases in Gorilla and (Dr. G. T. Ashley), 608
China, Dr. W. E. · Appointed keeper of the Department of Entomology in the British Museum (Natural History), 908
Chitin : Inability of Varied-Carpet Beetle Larvae (*Anthrenus verbasci* L.) to digest (Ch. Jeuniaux), 1129
  Occurrence of, in the Epicuticle of an Arachnid *Palamneus swammerdami* (Dr. G. Krishnan, G. N. Ramachandran and M. S. Santanam), 557
Chu, Miss B. T. : Botany of Seaweed, 1107
*Chlorella* : Manganese Requirement and Carbon Source in (Prof. André Pirson and Ludwig Bergmann), 209
Chloride : A Reagent for the Detection of, and of certain Purines and Pyrimidines on Paper Chromatograms (T. Wood), 175
Chloride Ions in the Secretion of the Pitcher Plant (Shelagh Morrissey), 1220
Chlorine-substituted Vitamin $B_{12}$ : Some Observations on the Crystal Structure of a (M. J. Kamper and Dr. Dorothy Crowfoot Hodgkin), 551
Chlorophyll Deficiency in *Gossypium arboreum* L. : An Apparent Change from Cytoplasmic to Nuclear Control of a Form of (Bhola Nath), 316
Chlorophyll Spectra and Molecular Structure (J. C. Goedheer), 928
Chloroplast Fragments : Oxidative and Photosynthetic Phosphorylation by (Takao Ohmura), 467
Chloroplasts of *Nitella cristata* : Structure and Swelling Properties of (F. V. Mercer, A. J. Hodge, A. B. Hope and J. D. McLean), 389
Chloroplasts (Isolated) : Inhibition by Cyanide of the Photochemical Activity of (Norman I. Bishop and John D. Spikes), 307
Chlorpromazine : Identification and Pharmacological Properties of a Major Metabolite of (Norman P. Salzman, Neil C. Moran and Bernard B. Brodie), 1122
Choanichthyes or Sarcopterygii ? : Herpetichthyes, Amphibioidei, (Prof. Alfred Sherwood Romer), 126 ; (Dr. Ethelwynn Trewavas, Dr. E. I. White, N. B. Marshall and Denys W. Tucker), 126
Cholesterol and Fat Metabolism in relation to Diet and Disease (Scottish Branch of the Nutrition Society and the Biochemical Society, Symposium on), 288, 774
Cholinesterase · Effect of Inhibition of, on the Motility of the Small Intestine (Dr. J. Admiraal, Dr. D. K. Myers and J. C. van Houten), 468
Cholinesterase at the Myoneural Junction : Effect of Denervation on the Histochemical Appearance of (R. S. Snell and N. McIntyre), 884
Cholinesterases : Inhibition of, by 1 : 2 : 4-Triazoles (Dr. J. B. Polya), 1175
Chondroitin Sulphate Synthesis : Glutamine as an Accelerator of (Harry Boström, Lennart Rodén and Anders Vestermark), 601
Chorio-allantoic Membrane : Reproduction of Mumps Virus in the (Dr. H L. Wolff), 604
Chouard, P. : Problems of International Concern in the Biological Sciences, 243
Chowdhury, A B., and others : 'Kernechtrot' or Nuclear Fast Red in the Histochemical Detection of Calcareous Corpuscles in *Taenia saginata*, 701
Christian Belief : Science and (Prof. C. A. Coulson), *review* by Dr. Charles E. Raven, 410
Christian Faith in the World of Science, *review* by Dr. Charles E. Raven, 410
Christmas Lectures (British Museum (Natural History)), 1153
Christmas Lectures of the Royal Institution (Prof. H. W. Melville), 725, 1056
Christmas Lectures for School Children, 1056
Christopherson, Prof. D. G. : Appointed to the chair of applied science in the Mechanical Engineering Department of the Imperial College of Science and Technology, 13 ; work of, 13
  Plasticity of Materials, 544
Christopherson, Dr. J. B. : *Obituary* by Sir Philip Manson-Bahr, 377
Chromate (Silver) : Crystallization of (Miss J. R. Howard and Dr. G. H. Nancollas), 833
Chromatogram (Paper), of Tertiary Alkyl Phosphates, Thiolophosphates and Thionophosphates : A General Method for Locating the Spots on a (Dr. Irmgard K. H. Otter), 1078
Chromatograms (Paper) : A Reagent for the Detection of Chloride and of certain Purines and Pyrimidines on (T. Wood), 175
Chromatographic Spots of Cobalt and Copper : Direct Spectrophotometric Determination on Paper of (A. Lacourt and P. Heyndryckx), 880
Chromatographic (Paper), and Biological Properties of Reserpine and related Compounds (Dr. R. J. Boscott and Dr. Amiya B. Kar), 1077
Chromatography (Hatfield Technical College Symposium on), 677
  Growth-Substances separated by (N. P. Kefford), 249
  Michael Tswett's First Paper on (Gerhard Hesse and Herbert Weil), *review* by Dr. R. Consden, 526, 632
Chromatography (Ion-Exchange), in Alcohol (Dr. K. K. Carroll), 398
Chromatography (Paper) : Application of, to Structural Problems in the Veratrum Alkaloid Group (K. Macek and Z. J. Vejdelek), 1173
  Separation within the Homologous Series of *n*-Alkyl Sulphates, *n*-Alkyl Pyridium and *n*-Alkyl Trimethyl Ammonium Halides by (H. Holness and W. R. Stone), 604
  Separation and Identification of Phenols by (J. Green and S. Marcinkiewicz), 1172

Chromatography (Paper), of Steroid Glucuronosides and Sulphates (Marvin L. Lewbart and Dr. John J. Schneider), 1175
Chromatography (Paper), of Thyroxine : Probable Nature of an Artefact in the, caused by Trichloracetic Acid (J. D. Acland), 694
Chromatography (Partition), of Synthetic Detergents (F. Franks), 693
Chromatography (Quantitative Paper), of Sugars : Use of Acid-Base Indicator for (K. J. Gardner), 929
Chromatography (Sorption), of Polar Substances on Polyamides (V. Carelli, A. M. Liquori and A. Mele), 70
Chromatography (Spot), of Hydraulic Mineral Oils using Fuller's Earth (J. E. C. Stringer), 81
Chromatography (Vapour-Phase Partition) : A New Detector for (R. P. W. Scott), 793
Chromatophores (Iris-) : Reaction to Light of (Ernest Middlemiss), 353
Chromium–Germanium Region : Reliability of Atomic Masses in the (John T. Kerr, John G. V. Taylor and Prof. Henry E. Duckworth), 458
Chromosome as a Physico-Chemical Entity (Prof. C. D. Darlington), 1139
Chromosome Number of Human Cervix Uteri (Dr. G. K. Manna), 354
Chromosomes : Aphid (A. W. Colling), 207
Chromosomes of Palms : A New Technique for the Study of (A. K. Sharma and S. K. Sarkar), 261
Chromospheric Spectrum : Interference Photography of the (Dr. P. J. Treanor), 1166
Church, G. R. (Smith, D. B., and) : A Method of Locating Interfaces in Oil Pipelines, 223
Ciba Foundation : Awards for Research on Ageing, 539
  Appointment of Sir George Lloyd Jacob as a Trustee, 1056
Cigar Industry Annual Research Award made to Dr. Walter G. Frankenburg by the Cigar Manufacturers Association of America in conjunction with the Cigar Institute of America, 1200
Cigar Institute of America (Cigar Manufacturers Association of America, in conjunction with the) : Cigar Industry Annual Research Award made to Dr. Walter G. Frankenburg, 1200
Cigar Manufacturers Association of America, in conjunction with the Cigar Institute of America : Cigar Industry Annual Research Award made to Dr. Walter G. Frankenburg, 1200
Cilia (Plant) : Plane of Bilateral Symmetry in (Prof. I. Manton), 123
Cinematography in Scientific Research (Scientific and Technical Group of the Royal Photographic Society Discussion on), 726
Circular Polarization of Gamma-Rays following Polarized Neutron Capture (Dr. Georg Trumpy), 507
Circulating Blood : Elimination of Adrenaline and Noradrenaline from the (Dr. Olov Celander and Stefan Mellander), 973
City : Growing Up in the (John Barron Mays), *review* by A. N. Oppenheim, 91
City and Guilds of London Institute : Seventy-fifth Annual Report, 431
Civic University, Aspects of a British Tradition (Prof. W. H. G. Armytage), 567 ; *review* by J. F. Wolfenden, 411
Civil Engineering : Soil Mechanics, Geology and (British Association for the Advancement of Science, Sections C (Geology) and G (Engineering), Symposium on), 715
Civil Engineers, Institution of : Conference on the Correlation between Calculated and Observed Stresses and Displacements in Structures, 149
  Graham Clark Lecture (Sir Harold Hartley), 150
  Thirtieth Parsons Memorial Lecture (Sir Harold Roxbee Cox), 1104
Civil Engineers, Institution of, and others : First meeting of the British Nuclear Energy Conference, 956
Civil Servants (Higher), in Britain from 1870 to the Present Day (R. K. Kelsall), *review* by R. Brightman, 665
Civil Service : Administrative Class of the, *review* by R. Brightman, 665
  Security Regulations and the, 1233
Civil Service, Royal Commission on the : Report for 1953–55, 1234
*Clarias mossambicus* Peters. : Reproduction in the Cat-fish (P. H. Greenwood), 516
Clark, Geoffrey : Land Use in Britain, 338
Clark, Prof. Grahame : *Obituary* of Prof. Haakon Shetelig, 582
Clark, Prof. George L. : Applied X-Rays, fourth edition, *review* by Prof. H. Lipson, 573
Clark, Prof. J. G. D. : Excavations at Star Carr, an Early Mesolithic Site at Seamer, near Scarborough, Yorkshire, *review* by G. F. Mitchell, 91
Clark, Dr. R. B., and Milne, Dr. A. : Marine Biological Research, 108
Clark (Graham) Lecture of the Institution of Civil Engineers (Sir Harold Hartley), 150
Clark (Heath) Lectures, 1953 (Dr. Paul F. Russell), *review* by Dr. E. Ashworth Underwood, 1040
Clarke, L. N. (Kelsey, Kathleen E., and) : Effect of Temperature and Initial Moisture Content on the Heat of Wetting of Wood, 83
Clarkson, R. : Awarded a Fellowship by the British Oxygen Co., Ltd., for postgraduate research in chemistry, 539
Classical Electromagnetism, *review* by E. Wild, 1237
Classification : Importance of Larval Characters in (British Association for the Advancement of Science, Section D (Zoology), Discussion on), 911
Classification of Insects (Prof. Charles T. Brues, Prof. A. L. Melander and Prof. Frank M. Carpenter), new edition, *review* by Dr. H. E. Hinton, 46
Clathrate : Benzene-$^{14}C_1$ from the Neutron Irradiation of the, with Ammoniacal Nickel Cyanide (Alfred P. Wolf, Carol S. Redvanly and R. Christian Anderson), 831
Clayson, Dr. D. B. (Bradshaw, L., and) : Metabolism of Two Aromatic Amines in the Dog, 974
Clayton, Barbara E., and Hammant, Joyce E. : Modification of Response to Adrenocorticotrophic Hormone by the Simultaneous Administration of Gonadotrophic Hormones, 401
Clayton, Mrs. R. M. : Immunity and Development, 852
Clean Air Bill, 335 ; Second reading of, 955
Cleanliness of the British Scene, 491
Cleavage of the Eggs of *Hydroides norvegica* in the Mediterranean : Mode of (Prof. Alexander Wolsky), 75
Cleave, Dr. J. (Booth, Dr. A. D., and) : Information Theory, 774
Cleaves, Dr. Arthur B. (Schultz, Dr. John R., and) Geology in Engineering, *review* by Dr. F. J. North, 1091
Cleland, R. E. : Problems of International Concern in the Biological Sciences, 242
Clemence, Dr. G. M : Definition of the Second of Time, 1230
Clémens, Prof. R. : Attitudes, Opinions and Behaviour, 450
Climates (Cold) : Physiology in, *review* by Dr. J. R. Brown, 849
Climatic Changes : Comets and, 1152
Climatic Modification in the Norwegian Arctic : Winter Observations on a Zone of (N. C. Negri), 292
Climats : Évidences Cométaires des variations des (F. Link et Z. Linková), 1152
Clock (Astronomical), in York Minster, 954
Cloud Physics (Physical Society and the Royal Meteorological Society Conference on), 770, 1104
Cloud Shade and Shedding in Cotton : Correlation between (Alan Goodman), 39
Clover (Wild White), in Natural Mountain Grassland : Ecology of Snowdonia—(A. D. Bradshaw and Tom Pritchard), 596
Clover Plants : Nodulation of (E. R. Turner), 193
Cluley, H. J. : Chemical Aspects of Semiconductors, 154
Cluley, J. C. : Appointed a lecturer in electrical engineering at the University of Birmingham, 1055
Co-operative Book Purchase in British Libraries : Subject Specialization and (K. G. Hunt), 62
Co-ordination of Galactic Research (edited by A. Blaauw), *review* by Prof. R. O. Redman, 847
Coagulation of Semen : Enzymatic (G. Gotterer, D. Ginsberg, T. Schulman, Julia Banks and Dr. H. G. Williams-Ashman), 1209
Coagulation (Slow) : Electrophoretic Measurement of the True Zeta-Potential of Arsenious Sulphide Sol in the Region of (Prof. B. N. Ghosh and K. C. Ray), 1080
Coal : The Carbon of (Sir Cyril Hinshelwood), 586
  Germanium in some of the Waste-Products from (K. V. Aubrey), 128
  Thermal Expansion of (J. C. Macrae and C. Ryder), 265; (A. S. Joy), 924
Coal Board, National : Committee for Research into Human Problems, 490
  Change of titles of the Central Research Establishments, 910
Coal Board, National (North-Eastern Division) : Gift of £3,000 to the University of Leeds, for the Department of Mining, 194
Coal Deposits of Tertiary Age in West Spitsbergen : Pollen-grains and Spores in (Svein Manum), 248
Coal Preparation : Postgraduate Course in (University of Birmingham), 15
Coal Science : International Conference on, 103
Coal Science Lecture of the British Coal Utilization Research Association (Sir Cyril Hinshelwood), 586
Coal Seam as a Guide for Seismic Energy (Dr. F. F. Evison), 1224
Coal Utilization Research Association, British : Fourth Coal Science Lecture (Sir Cyril Hinshelwood), 586
Coals : Glossary of, *review* by Dr. J. Bronowski, 184
Coals and Bitumens and related Fossil Carbonaceous Substances (Dr. S. I. Tomkeieff), *review* by Dr. J. Bronowski, 184
Coates, Prof. G. E. : Organo-Metallic Compounds, 59
Coates, Dr. Marie E. : Biological and Microbiological Methods of Estimating Vitamin $B_{12}$, 385
Cobalt Complexes with the Epimeric Salicylidenementhylamines : Steric Effects in the Formation of Copper and (C. S. Hocking, Dr. W. G. P. Robertson and Dr. B. O. West), 832
Cobalt-60 and Cesium-137 : Protection against Radiations from Radium, (United States National Bureau of Standards, Handbook 54), 769
Cobalt and Copper : Direct Spectrophotometric Determination on Paper of Chromatographic Spots of (A. Lacourt and P. Heyndryckx), 880
Cocker, Prof. W. : Chemistry of Naturally Occurring Pyrones, 637
Cockcroft, Sir John : Genetical Effects of Radiation from Products of Nuclear Explosions, 115
  The Peaceful Uses of Atomic Energy—The Geneva International Conference, 482
Coconut Milk : Growth Factors and Tumorous Growth in (Prof. F. C. Steward, S. M. Caplin and E. M. Shantz), 537
Coelacanths : Live (Prof. J. L. B. Smith), 473
Coelenterate Nematocysts : Cytochemical Research on (M. Hamon), 357
Coenzyme I Model Substance : Mechanism of some Reduction Processes Illustrated on a (Dr. Gabriel Stein and Gad Stiassny), 734
Cohen, B., and others : Autoradiographic Localization of Iodine-131 in the Salivary Glands of the Hamster, 1268
Cohen, Prof. John : A Survey of Current Psychology, *review*, 230
Cohen, J. A. : Physical Chemistry of Enzymes, 959
Cohen, Dr. M. : Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Cohen, T. : Awarded a Ramsay Memorial Fellowship for 1955–56, 336
Cohen-Bazire, Dr. Germaine, and others : Function of Carotenoids in Photosynthesis, 1211
Cohen-Séat, G. : Psychology and the Film, 1110
Cold : Heat and (J. A. Chaldecott), 538
Cold Climates : Physiology in, *review* by Dr. J. R. Brown, 849
Cold Environment : Man in a (Prof. Alan C. Burton and Prof. Otto G. Edholm), *review* by Dr. J. R. Brown, 849
Cold Vasodilatation in the Finger . Effect of Anti-histamine Substances on (G. C. Whittow), 511
Cole, Prof. F. J. : Man and Animals, *review*, 418
Cole, Dr. H. A., and Hancock, D. A. . Marine Biological Research, 108
Cole, Dr. R. David, and others : Amino-Acid Sequence of Alpha-Corticotropin, 687
Cole, R. K. (Hutt, Prof. F. B., and) : Resistance to Lymphomatosis in the Fowl in relation to Reproduction, 1178
Cole (*Brassica* sp.) History of (G. E. Fussell), 48
Colicine *K* (Dr. Walther F. Goebel, Guy T. Barry, Margaris A. Jesaitis and Elizabeth M. Miller), 700
Coliform Cultures : Aeration of (Dr. G. A. Morrison, D. E. Griffiths and M. Harris), 1178
Collagen : Extraction of, from Tissues (Shirley M. Fitch, Mrs. Margaret L. R. Harkness and Dr. R. D. Harkness), 163
  Our Present Knowledge of (Prof. Dr. Wo Grassmann), 587
  The Polypeptide Chain Configuration of (Dr. Pauline M. Cowan, Dr. Stewart McGavin and Dr. A. C. T. North), 1062
  Structure of (Prof. G. N. Ramachandran and Dr. Gopinath Kartha), 593 ; (Dr. Alexander Rich and Dr. F. H. C. Crick), 915
Collagen soluble in Salt Solution at Neutral pH : Isolation and Properties of a (D. S. Jackson and J. H. Fessler), 69
Collagen Fibrils : Apparent Transformation of, into 'Elastin' (Prof. D. Burton, Dr. D. A. Hall, Dr. M. K. Keech, Dr. R. Reed, Miss H. Saxl, Prof. R. E. Tunbridge and Miss M. J. Wood), 966

Collecting Tubules (Renal): Mucins in the Epithelium of (Dr. B. Monis and Dr. J. B. Longley), 741
Collection and Testing of Insects as Vectors of Plant Viruses: A Combined Aspirator and Feeding Cage for the (J. T. Legg), 609
Collectors · Scientific Books, Libraries and (John L. Thornton and R. I. J. Tully), *review* by Prof. E. N. da C. Andrade, 663
College of Aeronautics  Appointment of Prof. A. J. Murphy as principal, 55
College of Physicians of Philadelphia: Alvarenga Prize for 1955 awarded to Dr. C. H. Rammelkamp, 336
Collett, R. L.: *Obituary* by Dr. H. J. T. Ellingham, 582
Colley, D. I · Library Resources for Industry and Commerce in the Manchester Area, 198
Colling, A. W.: Aphid Chromosomes, 207

Collyer, D. M., and Fogg, G. E. · Fat Accumulation by Algae, 586
Colombani, Prof. M. A.. Propriétés magnétiques des lames métalliques minces, *review* by Prof. L. F. Bates, 416
Colonial Development Corporation. Report for 1954, 146
Colonial Development and Welfare Acts  Return of Schemes for 1954–55, 320, 1158
Colonial Microbiological Institute, Trinidad: Appointment of W. G. G. Forsyth as director, 195
Colonial Office  The Colonial Territories 1954–55, 320, 639
Colonial Road Research Section at the Road Research Laboratory, 56
Colonial Service · Recent Appointments and Promotions, 15, 195, 539, 910, 1248
Colonial Social Science Research Council · Appointment of Sir Arnold Plant as chairman, 58
Colonial Students in Britain (Report by PEP), 320, 591
Colonial Territories: Educational Problems of the, 319; (Prof. J. B. S. Haldane), 750
Colonial Territories, 1954–55 (Colonial Office), 320
Colonial Territories of the British Commonwealth: Report for 1954–55, 639
Colonial University Grants Advisory Committee  Appointment of Sidney John Worsley as secretary, 336
Colonial University Institutions · British, 675
Colonies, Secretary of State for the · Appointment of a Committee to advise on matters of Road Research for the benefit of the Colonies, 56
Colonies  Education and Social Development in the, *review* by R. Brightman, 757
  Higher Education in the, 1198
  Road Research for the benefit of the (Appointment of a Committee by the Secretary of State for the Colonies to advise on matters of), 56
Colonies (British). Development and Welfare in the, 1158
Color in Foods (Quartermaster Food and Container Institute of Chicago Report on), 491
Colorado Plateau  Palæomagnetism of Sediments from the (Dr. S. K. Runcorn), 505
Colorado River: Palæomagnetic Study of Rocks from the Grand Canyon of the (Richard R. Doell), 1167
Colorimetric Determination of Micro Quantities of Calcium (T. T. Gorsuch and A. M. Posner), 268
Colorimetry and Theories of Colour Vision (Dr. D. B. Judd), 100
Colour of Tellurite Glasses (Dr. P. L. Baynton), 691
Colour Anomaly, the Rayleigh Equation and Selective Adaptation (R. L. Gregory), 172
Colour Problem, a Study of Racial Relations (Anthony H. Richmond), *review* by Prof. T. S. Simey, 416
Colour Specification—Possible Revision of the C.I.E. System (Dr. W. S. Stiles), 95
Colour Television Experiments: B.B.C., 815
Colour Vision: Colorimetry and Theories of (Dr. D. B. Judd), 100
  The Ishihara Test and Defects in (Peter Cavanagh), 816
Combined Amino-Acid Content of Tumour and Homologous Normal Tissue (Dr. G. C. Easty and Dr. E. J. Ambrose), 1256
Combined Aspirator and Feeding Cage for the Collection and Testing of Insects as Vectors of Plant Viruses (J. T. Legg), 609
Combustion · Flames and (British Association for the Advancement of Science, Section A (Physics), Discussion on), 771
  Physical Measurements in Gas Dynamics and (edited by R. W. Ladenburg, B. Lewis, R. N. Pease and H. S. Taylor), *review* by Dr. A. G. Gaydon, 1040
Combustion in Theory and Practice (T. F. Hurley), 1239
Comécaires des variations des Climats: Évidences (F. Link et Z. Linková), 1152
Comets and Climatic Changes, 1152
Commemorative Medal of Prince Albert I of Monaco (the Manley-Bendall Prize) awarded to Dr. J. N. Carruthers by the Oceanographical Institute of Monaco, 16, *erratum*, 58
Commerce in the Manchester Area. Library Resources for Industry and (Northern Branch of Aslib Conference on), 198
Commercial Preparations of Cytochrome *c*: Spectroscopic Observations on (Knud Max Moller and David M. Prescott), 1121
Commercial and Technical Libraries (J. P. Lamb), *review* by R. Brightman, 1090
Commonwealth: Yearbook of the Universities of the, thirty-second issue, *review*, 92
Commonwealth of Australia · Commonwealth Scientific and Industrial Research Organization Report for 1953–54, 540
Commonwealth (British): Colonial Territories of the (Report for 1954–55), 639
Commonwealth (British), Association of Universities of the: Commonwealth Inter-University Conference, 194
  Report of the Proceedings of the 1954 Conference of the Universities of Great Britain and Northern Ireland, 195
  Appendixes II and III of the Commonwealth Universities Yearbook 1955, Postgraduate Awards in British Commonwealth Universities, 1199
Commonwealth Fund, New York: Fellowships for Study and Travel in the United States, 725
  Grants for Medical Education in the United States, 1102
Commonwealth Agricultural Bureaux  Publication of *Veterinary Reviews and Annotations*, No. 1, 99
  Appointment of J. E. C. Coventry as chairman, 241
  History, Work, Administration and Finance of the, revised edition, 287
Commonwealth Health and Tuberculosis Conference · Fourth (National Association for the Prevention of Tuberculosis), 245
Commonwealth Inter-University Conference (Association of Universities of the British Commonwealth), 194
Commonwealth Mycological Institute (Dr. S. P. Wiltshire), 189
Commonwealth Observatory, Canberra: Report of the Commonwealth Astronomer for the Year 1954, 592
Commonwealth Scientific and Industrial Research Organization: Sixth Report (1953–54), 540
Commonwealth Survey Officers · Conference of (Brigadier G. Bomford), 1057
Commonwealth Universities Yearbook, *review*, 92
Commonwealth Universities (British): Postgraduate Awards in (Association of Universities of the British Commonwealth), 1199
Commonwealth and Nuclear Development (Central Office of Information, Reference Pamphlet No. 2), 334
Companhia de Diamantes de Angola: Publication Culturais No. 22, Révision systématique des Glossines du groupe *palpalis* (Diptera), (A. de Barros Machado), 537
Comparative Study of the Mode of Action of X-Rays and Alkylating Agents (Dr. Iwao Hirono), 1168
Comparison of Rectal and Deep Body Temperature in the Calf (Dr. John Bligh), 402
Complement Activity  Inhibition of, by Di-isopropyl Fluorophosphate (Dr. Elmer L. Becker), 1073
Complete Suppression of Stammering · Experiments on the (Dr. E. Colin Cherry, B. McA. Sayers and Pauline M. Marland), 874
Complex Formation between Montmorillonite and High Polymers (Dr. W. W. Emerson), 461
Complex Potential-Well Nuclear Model · The Photonuclear Effect and the (J. P. Davidson), 649
Complexes of Fluorocarbons and Fluorocarbon Derivatives with Polar Hydrocarbons, Polar Polymers, Proteins and Polypeptides: Formation of (H. B. Klevens) 979
Complexes of the Zinc Group Metals: Action of, on the Tail Protein of Bacteriophage $T_2r^+$ (L. M. Kozloff and K. Henderson), 1169
Complexes (Copper and Cobalt): Steric Effects in the Formation of, with the Epimeric Salicylidenementhylamines (C. S. Hocking, Dr. W. G. P. Robertson and Dr. B. O. West), 832
Complexes (Interlamellar Sorption), of Graphitic Acid with Organic Substances (J. Cano Ruiz and Dr. Douglas M. C. MacEwan) 1222
Component of Carp Myogen precipitating at High Ionic Strength: A Crystalline (J. G. Henrotte), 1221
Component Proteins of a Deoxyribonucleoprotein: Characterization and Total Recovery of the (Dr. G. Toennies and B. Bakay), 696
Components of the Cytochrome System  Relationship between certain (Prof. D. Keilin and Dr. E. F. Hartree), 200
Composition (Isotopic), of Meteoritic Hydrogen (George Edwards), 109
Compound *D*: New Flavones from *Pongamia pinnata* (L.) Merr.—Identification of (S. K. Pavanaram and Dr. L. Ramachandra Row), 1177
Compound-nucleus Model · Development of the (Prof. E. P. Wigner), 638
Compounds: A New Class of, containing the Pentacyanoferrate Group and an Unpaired Electron (Dr. E. F. G. Herington), 80
  Organo-Metallic (Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry Symposium on), 59
  Paper Chromatographic and Biological Properties of Reserpine and related (Dr. R. J. Boscott and Dr. Amiya B. Kar), 1077
  Visible Spectrum of Potassium Ethyl 1-Methoxypicrate and of related (R. Foster), 746
Compounds (Cytotoxic Azo): Reduction of, by Hydrazine and by the Xanthine Oxidase–Xanthine System (Dr. W. C. J. Ross and G. P. Warwick), 298
Compounds (Inclusion) · Stoichiometry of (Prof. R. M. Barrer), 745
Compounds (Iodinated) · Anti-tumorigenic Action of (Prof. F. B. Oberbauer, Prof. H. R. Croxatto, M. O. Gaillard and V. M. Silva), 466
Computer (An Electronic), for the Evaluation of Results of Filter-Paper Electrophoresis (M. D. Paulik and L. Pinteric), 1226
Computer (An Electronic), for the Meteorological Office, 1054
Computers (Digital), of the United States National Bureau of Standards, 1003
Computing Machine as a Mechanical Dictionary: Use of a (Dr. Andrew D. Booth), 565; (Dr. J. C. Kendrew), 984
Computing Machinery, Association for: Annual General Meeting, 149
Conalty, Michael L., and others: Antituberculur Effect of an Extract of *Adhatoda vasica*, 119
Concentration of *Brucella* Vaccine (Dr. G. C. van Drimmelen), 469
Concept of Acid-Strength and Acidity: A Generalization of the (M. Mandel), 792
Concrete: Testing, by an Ultrasonic Pulse Technique (Dr. R. Jones and E. N. Gatfield), 538
Concrete and Plaster (Perlite). Secondary Expansion of (R. D. Hill), 29
Conductibilité électrique des lames métalliques minces (Prof. A. Blanc-Lapierre et Prof. M. Perrot), *review* by Prof. L. F. Bates, 416
Configuration of Collagen: The Polypeptide Chain (Dr Pauline M. Cowan, Dr. Stewart McGavin and Dr. A. C. T. North), 1062
Configurations of Tiglic and Angelic Acids—an X-Ray Determination (A. L. Porte and Prof. J. Monteath Robertson), 1116
Congenital Porphyria in Swine and Cattle in Denmark (S. K. Jørgensen and Dr. Torben K. With), 156
Congo (Belgian) · Research in the, 630
Connective Tissue: Influence of Cortisone on—Epithelial Relations in Wound Healing, Hair Regeneration and the Pathogenesis of Experimental Skin Graft (Prof. Theodore Gillman, Jack Penn, Doris Bronks and Marie Roux), 932
Consden, Dr. R.. Michael Tswett's First Paper on Chromatography, *review*, 526, 632
Conservation of Natural Resources: The Engineer and the (E. J. Holmgren), 150
Conservation of Nature in the Near and Middle East: Proceedings of the Conference on (Unesco), 58
Constable, Prof. W. G.: The Place of Museums in a Changing World, 246
Constituent of Plants. Azetidine-2-Carboxylic Acid, a New (Dr. L. Fowden), 347
Constituent (Normal), of Human Urine: Identification of $N^2$-Methylguanine (2-Methylamino-6-hydroxypurine) as a (Bernard Weissmann, Philip A. Bromberg and Alexander B. Gutman), 1217

Constituents of the Air Spora of Southern Nigeria : Seasonal Changes in Three Common (R. H. Cammack), 1270
Consumers' Expenditure in the United Kingdom, 1900–1919 (A. R. Prest, assisted by A. A. Adams), *review*, 4
Consumers' Expenditure and Behaviour in the United Kingdom, 1920–1938 : The Measurement of (Richard Stone), Vol. 1, *review*, 4
Continuous Carbon Dioxide Analyses : Single-Breath (L. Feinmann, G. L. Leathart and G. B. Pendleton), 739
Contractile Vacuole of Parazoa and Protozoa, and the Golgi Apparatus (Prof. J. Brontë Gatenby, and Dr. A. J. Dalton and Dr. M. D. Felix), 301
Control of the Cattle Tick : *Temporary Destocking of Pastures to aid* (Dr. P. R. Wilkinson), 515
Control of Fertility by Antimitotic Agents (Dr. B. P. Wiesner and Prof. John Yudkin), 249
Control of Nuclear Weapons . International, *review* by R. Brightman, 894
*Control of Yeast Contamination by 'Mycostatin' in Cultures of the Virus of* Foot-and-Mouth Disease (Jacqueline O. Wigmore and W. M. Henderson), 516
Control (Automatic) : Measurement and, *review* by Dr. G. D. S. MacLellan, 275
Control (Automatic), *in Industry : Social Implications of*, 133
Control (Automatic), in the Process Industries (Institution of Chemical Engineers and the Society of Instrument Technology Conference on), 241
Control (Environmental), in Crop Experimental Work (Dr. J. P. Hudson), 1197
Control (Natural), of Animal Populations, *review* by C. S. Elton, 419
Conway, Dr. E. : Botany of Seaweed, 1107
Cook, Dr. J. W. : Chemistry of Naphthalenes and Sterols, *review* 523
Cook, Dr. R. P. : Cholesterol and Fat Metabolism in relation to Diet and Disease, 774
Cook's Voyages : The Botany of, and its Unexpected Significance in relation to Anthropology Biogeography and History (Prof. Elmer Drew Merrill), *review* by Dr. Eric Ashby, 850
Cooke, Dr. B A. : Charge acquired by Powdered Salts on moving over Metal Surfaces, 264
Cooke, Dr. E R. N. Appointed specialist (pathologist), Kenya, 1248
Cooke, N. Jane, and others . Occurrence of *n*-Nonadecanoic Acid in Ox Perinephric Fat, 882
Cooke-Yarborough, E. H. Design of Electronic Devices for Production, 1060
Coombes, J. D. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 770
Coope, Dr. R. : Pulmonary Circulation and Respiratory Function, 961
Cooper, Dr. Franklin S. : Elected president and director of research of Haskins Laboratories, Inc , New York, 145 ; work of, 145
Cooper, Prof. K. E. : Theory of Antibiotic Inhibition Zones in Agar Media, 510
  Modern Trends in Microscopy, 730
Cooper, Prof. M. M. : Animal Production from Grass, 728
Coopers Hill War Memorial Prize and Medal of the Institution of Electrical Engineers awarded to D. McDonald, 16
Coot (American) : Breeding Behaviour of the (G. W. Gullion), 389
Copals and their Botanical Origin (L. Hellinck), 910
Cope, R. N. : Appointed geologist, Federation of Nigeria, 195
Copley Medal for 1955 of the Royal Society awarded to Sir Ronald Fisher, 907, 1093
Copolymers (Antibiotically Active Amino-Acid), related to Gramicidin S (Dr. Ephraim Katchalski, Arieh Berger, Leah Bichowsky-Slomnicki and Joseph Kurtz), 118
Copper (edited by Allison Butts), *review* by A. R. Bailey, 526
Copper (Electrodeposited) Growth Spirals in (H. J. Pick), 693
Copper (Cobalt and) : Direct Spectrophotometric Determination on Paper of Chromatographic Spots of (A. Lacourt and P. Heyndryckx), 880
Copper Acetate and Propionate : Direct Interaction between Copper Ions in the Molecules of (Ryutaro Tsuchida and Shoichiro Yamada), 1171
Copper Cathodes High-Pressure Glow-to-Arc Transitions with Tungsten and (W. L. Price, W. A. Gambling and Dr. H. Edels), 28
Copper Ions in the Molecules of Copper Acetate and Propionate : Direct Interaction between (Ryutaro Tsuchida and Shoichiro Yamada), 1171
Copper and Cobalt Complexes with the Epimeric Salicylidenementhylamines : Steric Effects in the Formation of (C. S. Hocking, Dr. W. G. P. Robertson and Dr. B O. West), 832
Copper-Sensitivity in *Saccharomyces* : *Gene Control of* (Arturo Brenes-Pomales, Gertrude Lindegren and Prof. Carl C. Lindegren), 841
Corbett, J. L. : Animal Production from Grass, 729
Cord Plasma : Insulin Activity of (R F. Santos, Prof. R. A. McCance and P. J. Randle), 115
*Corday-Morgan Medal for 1954 (Chemical Society)*, 1153
Cordier R., et autres : Vertébrés—Embryologie, grands problèmes d'anatomie comparée, caractéristiques biochimiques (Traité de Zoologie, publié sous la direction de Pierre-P. Grassé, Tome 12), *review* by Prof. C. H. O'Donoghue, 756
Corey, *Prof Robert B. : Lecture at the International Wool Textile Research* Conference, Australia, 712
Corfield, M. C. (Robson, Dr A., and) : Chemistry of Wool, 713
Cormack, D. V., and others . A Direct Measurement of the Energy Locally Absorbed from a Gamma-Ray Beam, 560
Corn and Agricultural Merchants, National Association of, and others : First National Crop Protection Conference (Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture), 1203
Corner, E. J. H. : Criteria of Families, 676
  Botanical Collecting with Monkeys, 724
Corner, Dr. George W. : Retirement as director of the Department of Embryology of the Carnegie Institution of Washington, 767
Cornett, Dr. R. W. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Cornforth, H. : Animal Production from Grass, 728
Cornwall, P. B. : Appointed senior scientific officer, West African Cocoa Research Institute, Gold Coast, 1248
Corona : *Positive-Point D.C.* (Dr. B. Murphy), 397
Corona Discharges at a Negative Electrode Localized (J. S. T. Looms), 977
Corona Wind Loud-speaker (D. M. Tombs), 923
Corpuscles (Calcareous), in *Taenia saginata* : 'Kernechtrot' or Nuclear Fast Red in the Histochemical Detection of (A. B. Chowdhury, B. Dasgupta and H. N. Ray), 701
Correlation between Calculated and Observed Stresses and Displacements in Structures (Institution of Civil Engineers Conference on), 149
Correlation between the Rates of Unimolecular Pyrolyses of Alkyl Halides in the Gaseous Phase and $S_N1$ Rates in Solution (Dr. Allan Maccoll and Dr. P. J. Thomas), 392
Corrosion : Humidity and (H. R. Ambler), 1082
Corrosion and Meteorology (Major P. A. Cartwright), 748 ; (Dr. J. C. Hudson), 749
Cortex and Medulla of Bird-Feathers (Dr. L. Auber), 1218
Cortical Extracts (Adrenal) . Nitrogen-containing Steroids in Aqueous (Klaus D. Voigt and Wolfgang Schroeder), 599
Corticotrophin : Cortisone and, 956
α-Corticotropin : Amino-Acid Sequence of (Prof. Choh Hao Li, Dr. Irving I Geschwind, Dr. R. David Cole, Dr. Ilse Dorothea Raacke, Dr. J. Ieuan Harris and Dr. Jonathan S Dixon), 687
Coryndon Memorial Museum, Nairobi : *Annual Report for 1954*, 631
Cortisone : Influence of, on Connective Tissue—Epithelial Relations in Wound Healing, Hair Regeneration and the Pathogenesis of Experimental Skin Graft (Prof. Theodore Gillman, Jack Penn, Doris Bronks and Marie Roux), 932
Cortisone and Corticotrophin, 956
Cosmic Radiation Effects in Meteorites (Dr. P. Reasbeck and Dr. K. I. Mayne), 733
Cosmic Ray Conference : International—Mexico Meeting, 1105
Cosmic Ray Physics : Progress in (edited by Dr. J. G. Wilson), Vol. 2, *review*, 1138
Cosmic-Ray Shower Curves for Lead : Anomalies in the (Prof. Rafi Mohammed Chaudhri, Abdul Qayum and Afzal Farooqi), 876
Cosmic Sources of Deep-Sea Deposits (Dr. E. J Öpik), 926
Cosmogony : Magnetodynamic, *review* by Thomas Gold, 274
Cosmology . Medieval, *review* by Prof. Herbert Dingle, 45
Cottin, M. . Chemical Effects of Ionizing Radiation, 197
Cotton . Correlation between Cloud Shade and Shedding in (Alan Goodman), 39
Cotton (Raw), its Properties and Distribution (Textile Institute Conference on), 677
Cotton Industry Research Association, British : Resignation of Dr. F. C. Toy as director of research, 1150
  Appointment of Dr. D. W. Hill as director of research, 1150
Cottrell, Prof. A H. . Theoretical Structural Metallurgy, second edition, *review* by Dr. J. A. Catterall, 229
Coulson, Prof. C. A. : Science and Christian Belief, *review* by Dr. Charles E. Raven, 410
  Advances in Molecular Spectroscopy, 682
  Science and the Humanities, *review*, 846
Coulson, Dr. C. B. : *New Free Amino-Acids in Plant Materials*, 518
Counting Live and Dead Bull Spermatozoa . A New Method for (A. D. Bangham and J. L. Hancock), 656
Counting Tritiated Water at High Humidities in the Geiger Region (Edward B. Butler), 1262
Counting and Sizing of Particles with the *Flying-Spot Microscope* (D. Causley and Prof. J. Z. Young), 453
Country-side : Golden Jubilee of, 56
Couper, A., and others : Physical Chemistry of Enzymes, 959
Couper, R. A. : Geological, Dynamical and Palaeomagnetic Aspects of Polar Wandering, 423
Courcon, Mlle. J., and others : A Study of Normal Human Cerebrospinal Fluid by the Immuno-Electrophoretic Method, 976
Court-Brown, W. M. : Progress in Radiobiology, 684
Courtaulds, Ltd. : New Viscose Research Laboratory of, 17
Courtaulds, Ltd., and others . *Establishment of an Industrial Fund for the* Advancement of Scientific Education in Schools, 860
Courtaulds' Scientific and Educational Trust Fund : Postgraduate Research Scholarships for 1955, 770
Courtney-Pratt, Dr. J. S. : Cinematography in Scientific Research, 726
Coventry, J. E. C. : *Appointed chairman of the Commonwealth Agricultural Bureaux*, 241
Cow . Adenosine Triphosphate in the Adrenal Medulla of the (Nils-Åke Hillarp, Bodil Nilson and Bertil Hogberg), 1032
Cow's Milk : Occurrence of Different β-Lactoglobulins in (Dr. R. Aschaffenburg and J. Drewry), 218
Cowan, Dr. Pauline M., and McGavin, Dr. Stewart : Structure of Poly-L-Proline, 501
Cowan, Dr. Pauline M., and others : The Polypeptide Chain Configuration of Collagen, 1062
*Cowan, W. M., and Powell, T. P. S. : Use of the Glees Silver Technique in* the Hypothalamus, 1124
Cowey, J. B. : A New Species of Sporozoan ?, 213
Cowley, G. S. : Appointed assistant director of agriculture (field services), Kenya, 539
Cowling Prof. T. G. : *Magneto-Hydrodynamics*, 234
  The Letters of Johann Bernoulli, *review*, 1187
Cox, Dr. D. R. : The Statistics of Change, *review*, 275
Cox, Prof E. G. The Education and Training of Graduate Staff for Industrial Research, 141
  English Style in Scientific Papers, 1250
Cox, Sir Harold Roxbee : The Development of the Gas Turbine (Parsons Memorial Lecture of the Institution of Civil Engineers), 1104
Cox, Dr. L. R. : *Obituary* of Dr W. K. Spencer, 952
Cox, R. A., and others : Effects of Gamma-Rays on Solutions of Sodium Deoxyribonucleate—Possible Chemical Mechanism for their Biological Effects, 919
Crabs (Fiddler) : Displacement Activities in (Helen R. S. Gordon), 356
Craggs, Dr. J. D. : Appointed to the *Robert Rankin* chair of electronic engineering in the University of Liverpool, 448, 953 ; work of, 953
Craig, Prof. D. P. . Appointed to the University of London chair of chemistry with special reference to theoretical chemistry at University College, 57, 191 ; work of, 191
Craufurd, R. Q. : Appointed scientific officer, plant breeder, *Sierra Leone*, 539
Crawford, B. L. : Advances in Molecular Spectroscopy, 681

Creaser, E. H. : Effect of 8-Azaguanine on Enzyme Formation, 556
Creatine Phosphokinase : Essential Relaxing Factor in Muscle other than Myokinase and (Dr. H. Mumagai, Dr. S. Ebashi and F. Takeda), 166
Creed, Dr. R. S. : The Sensory Pathway (Presidential Address to Section I (Physiology) of the British Association for the Advancement of Science), 443
  Lighting and Vision, 719
Cresson (Elliott) Medal of the Franklin Institute awarded to Dr. F. P. Bowden, 16
Crewther, W. G. : Chemistry of Wool, 713
Crick, Dr. F. H. C., and Rich, Dr. Alexander : Structure of Polyglycine II, 780
Crick, Dr. F. H. C. (Rich, Dr. Alexander, and) : The Structure of Collagen, 915
Criteria : Evaluation of Methods in Applied Psychology and the Problem of (Symposium at the Twelfth International Congress of Applied Psychology), 449
Critical Method of Measuring the Diameter of Living Bacteria with the Interference Microscope (K. F. A. Ross), 1076
Cromartie, Dr. R. I. T. : Awarded an I.C.I. Fellowship by the University of Cambridge, 381
Crompton, Dr. R. W., and others : Growth of Pre-Breakdown Ionization Currents in Hydrogen, 1079
Crop Experimental Work : Environmental Control in (Dr. J. P. Hudson), 1197
Crop Protection Conference : First National, 1203
Crosbie, G. W. : Appointed lecturer in biochemistry at the University of Glasgow, 957
Crosfill, Surgeon-Comdr. : Personnel Research in the Royal Navy, 192
Cross, Prof. Paul C., and others : Molecular Vibrations, *review* by Dr. J. W. Linnett, 1185
Cross-Incompatibility among some Mexican Diploid Species of *Solanum* : Overcoming (Dr. M. S. Swaminathan), 887
Crowdy, S. H., and Pramer, D. : Evidence of Translocated Antibiotics in Expressed Plant Sap, 335
Crowson, Dr. C. N. : Awarded a Senior Medical Research Fellowship by the National Research Council of Canada, 102
Croxall, Dr. H. E. : Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Croxatto, Prof. H. R., and others : Anti-tumorigenic Action of Iodinated Compounds, 466
Crucifer *Arabidopsis thaliana* (L.) Heynh : Biochemical Mutations in the (J. Langridge), 260
Cruickshank, Prof. Robert : Influence of Antibiotics on Modern Clinical Bacteriology, 730
Crustaceans : A Possible New Vitamin $A_1$ Isomer in the Eyes of (Georg Lambertsen and Olaf R. Braekkan), 553
Crustal Structure : New Zealand (G. A. Eiby), 32
Crutchlow, B. W. A. : Dust and Health in Industry, 764
Crystal Structure of Chamosite : Mineralogy and (R. F. Youell), 560
Crystal Structure of a Chlorine-substituted Vitamin $B_{12}$ : Some Observations on the (M. J. Kamper and Dr. Dorothy Crowfoot Hodgkin), 551
Crystal Structure of the Hexacarboxylic Acid derived from $B_{12}$ and the Molecular Structure of the Vitamin : Structure of Vitamin $B_{12}$—The (Dr. Dorothy Crowfoot Hodgkin, Jenny Pickworth, John H. Robertson, Prof. Kenneth N. Trueblood, Richard J. Prosen and John G. White), 325
Crystalline Component of Carp Myogen precipitating at High Ionic Strength (J. G. Henrotte), 1221
Crystalline Cytochrome *c* from the King Penguin (Gerhard Bodo), 829
Crystalline Inhibitors of Trypsin from Potato (Prof. Kamala Sohonie and K. S. Ambe), 972
Crystalline Solids : Vacant Lattice Sites in (Prof. N. F. Mott), 439
Crystallization of Silver Chromate (Miss J. R. Howard and Dr. G. H. Nancollas), 833
Crystallization of Water : Separation of Ions at (R. Brill and H. Ender), 925
Crystallography, International Union of : Symposium on Structure of a Scale between the Atomic and the Microscopic Dimensions, 1153
Crystals of Alkali Halides : Electrical Effects associated with the Mechanical Deformation of Single (J. E. Caffyn and T. L. Goodfellow), 878
Crystals of the Southern Bean Mosaic Virus Protein : Molecular Arrangement in (Dr. Louis W. Labaw and Dr. Ralph W. G. Wyckoff), 455
Crystals (Cubic) : Photo-elastic Dispersion in (K. S. Iyengar), 1119
Crystals (Zinc) : Flexural Rotational Slip as the Main Deformation Process in the Torsion of (A. D. Whapham and Dr. H. Wilman), 460
Cubic Crystals : Photo-elastic Dispersion in (K. S. Iyengar), 1119
*Cucurbita* : Electron Microscopic Observations on the Structure of the Sieve Plates in (C. E. L. Hepton, Prof. R. D. Preston and G. W. Ripley), 868
Cucurbitaceae : Cytoplasmic Nodules in the Endosperm of some (Dalbir Singh), 607
Culcheth Laboratories of the United Kingdom Atomic Energy Authority—Industrial Group (Dr. A. B. McIntosh), 484
*Culex pipiens* : Incorporation of Phosphorus-32 into the Malpighian Tubes during the Metamorphosis of (Hans Stich and Sister Mary Grell), 930
Culpin, S. : Appointed director of the Experimental Husbandry Farm at Drayton, Warwickshire, 102
Cultural Freedom, Congress for : Conference on Science and Freedom, *review* by R. B., 139
Cultural Relations with the U.S.S.R., Society for : Symposium on Soviet Science To-day, 1004
Culture (Submerged) : Production of Diphtheria Toxin in (P. V. Linggood, A. C. Matthews, S. Pinfield, Dr. C. G. Pope and T. R. Sharland), 1128
Cultures (Coliform) : Aeration of (Dr. G. A. Morrison, D. E. Griffiths and M. Harris), 1178
Cultures of the Virus of Foot-and-Mouth Disease : Control of Yeast Contamination by 'Mycostatin' in (Jacqueline O. Wigmore and W. M. Henderson), 516
Cumpston, R. F. : Appointed a principal agricultural supervisor, Nyasaland, 910
Curare Alkaloids (Prof. P. Karrer), 277
Curnow, H. J. : *Obituary* of Dr. W. G. Shilling, 1196
Curran, R. C. : Appointed senior lecturer in pathology at the University of Sheffield, 910
Curry, Dr. A. S. : Interference to the Ultra-Violet Spectrophotometry of Barbiturates, 877
Curry, W. T. : The Strength Properties of Plywood, Part 2, Effect of the Geometry of Construction (Forest Products Research, Bulletin No. 33), 248
Curtis, Dr. A. R. : Radiative Balance in the Atmosphere, 635
Curtis, Prof. W. E. : Retirement from the chair of physics at King's College, Newcastle-upon-Tyne, 815 ; work of, 815
Custers, Dr. J. F. H. : Large Type II Diamonds, 360
Cwilong, Dr. B. M. : Abnormal Freezing Nuclei in the Atmosphere, 129
Cyanide : Inhibition by, of the Photochemical Activity of Isolated Chloroplasts (Norman I. Bishop and John D. Spikes), 307
Cymerman-Craig, Dr. J., and others : Mode of Action of isoNicotinic Hydrazide, 34
Cymerman-Craig, Dr. J. (Rubbo, Dr. S. D., and) : Anti-Tuberculous Activity of Verazide (1-isoNicotinoyl-2-veratrylidene Hydrazide), 887
Cytochemical Research on Coelenterate Nematocysts (M. Hamon), 357
Cytochrome *c* : Effect of Ionizing Radiation on Haemoglobin and (Dr. H. Laser), 361
  Spectroscopic Observations on Commercial Preparations of (Knud Max Møller and David M. Prescott), 1121
  Stereochemical Structure of (Anders Ehrenberg and Prof. Hugo Theorell), 158
Cytochrome *c* from the King Penguin : Crystalline (Gerhard Bodo), 829
Cytochrome System : Relationship between certain Components of the (Prof. D. Keilin and Dr. E. F. Hartree), 200
Cytochromes of Microsomal Particles—Cytochrome $b_5$ of Microsomes from Animal Tissues (Margot Bailie and Dr. R. K. Morton), 111 ; Cytochrome $b_3$ of Microsomes from Plant Tissues (E. M. Martin and Dr. R. K. Morton), 113
Cytological Studies : Preparation of Cell Suspensions from Plant Roots for (Shirley Hornsey), 744
Cytology : International Review of (edited by Dr. G. H. Bourne and Prof. J. F. Danielli), Vol. 3, *review* by Dr. D. R. Newth, 664
  International Review of (edited by Dr. G. H. Bourne and Prof. J. F. Danielli), Vol. 4, *review* by Prof. J. Brachet, 1135
  Modern, *review* by Prof. J. Brachet, 1135
Cytology and Taxonomy of Ceylon Pteridophyta (I. Manton and W. A. Sledge), 631
Cytoplasm in Cellular Inheritance : Nucleus and (Prof. J. F. Danielli, Dr. I. J. Lorch, Dr. M. J. Ord and Miss E. G. Wilson), 1114
Cytoplasmic to Nuclear Control : An Apparent Change from, of a Form of Chlorophyll Deficiency in *Gossypium arboreum* L. (Bhola Nath), 316
Cytoplasmic Nodules in the Endosperm of some Cucurbitaceae (Dalbir Singh), 607
Cytotoxic Azo Compounds : Reduction of, by Hydrazine and by the Xanthine Oxidase–Xanthine System (Dr. W. C. J. Ross and G. P. Warwick), 298

DAANE, Thomas A., and others : Changes in Animal Tissue after Hydrocortisone Administration—Production of Dystrophic Calcification of Cardiac Muscle in Mice by Hydrocortisone, 503
Dadson, R. S. : A New Method for the Absolute Measurement of High Pressures, 188
Dahlia : Chemistry and Inheritance of Flower Colour in the (Dr. E. C. Bate-Smith, Dr. T. Swain and Dr. C. G. Nordström), 1016
Dahme, A. : Coal Science, 105
Daily, Prof. J. W. : Cavitation in Hydrodynamics, 809
Dainton, Prof. F. S. : Chemical Effects of Ionizing Radiation, 197
  Polarographic Instrumentation, 198
  Progress in Radiobiology, 683
Dairy Cattle : Hypomagnesaemia in, and its Possible Relationship to Ruminal Ammonia Production (M. J. Head and J. A. F. Rook), 262
Dairying, National Institute for Research in : Annual Report, 962
Dalcq, A., et autres : Vertébrés—Embryologie, grands problèmes d'anatomie comparée, caractéristiques biochimiques (Traité de Zoologie, publié sous la direction de Pierre-P. Grassé, Tome 12), *review* by Prof. C. H. O'Donoghue, 756
Dalcq, Prof. A. M. : Fertility, 340
Dale, Sir Henry : Wellcome Museums of the Royal College of Surgeons opened by, 1201
Dale, W. M., and Russell, C. : Chemical Effects of Ionizing Radiation, 197
Dales, Dr. R. Phillips : Marine Biological Research, 108
Dalitz, Dr. R. H. : Title of reader in mathematical physics in the University of Birmingham conferred on, 1055
Dalmat, Herbert T. : The Black Flies (Diptera, Simuliidae) of Guatemala and their Role as Vectors of Onchocerciasis, *review* by Dr. John Smart, 1238
Dalton, Dr. A. J., and others : The Contractile Vacuole of Parazoa and Protozoa, and the Golgi Apparatus, 301
Daly, Dr. de Burgh : Pulmonary Circulation and Respiratory Function, 960
Danby, Dr. J. P. : The National Leathersellers College, 1202
Daniel, Hawthorne, and Minot, Francis : The Inexhaustible Sea, *review* by Norman Holme, 478
Danielli, Prof. J. F. : Cambridge Monographs in Experimental Biology, *review*, 136
Danielli, Prof. J. F., and others : Nucleus and Cytoplasm in Cellular Inheritance, 1114
Danielli, Prof. J. F. (edited by Bourne, Dr. G. H., and) : International Review of Cytology, Vol. 3, *review* by Dr. D. R. Newth, 664
  International Review of Cytology, Vol. 4, *review* by Prof. J. Brachet, 1135
Daniels, M. : Chemical Effects of Ionizing Radiation, 197
Daniels, N. W. R. (Challinor, Dr. S. W., and) : Fat Production by Inositol-deficient Yeast, 1267
Danskin, D. : Elementary Bodies in Bovine Malignant Catarrh, 518
Darby, L. A. (Harrison, B. J., and) : Unilateral Hybridization, 982
Darcy, Dr. D. A. : Immunological Discrimination between the Blood of Normal and of Tumour-bearing Rats, 643
Darlington, Prof. C. D. : The Chromosome as a Physico-Chemical Entity, 1139
Darmois, Prof. G. : Elected a member of the Astronomy Section of the Paris Academy of Sciences, 1200

Dart, Prof. Raymond A. : The First Australopithecine Fragment from the Makapansgat Pebble Culture Stratum, 170
Dartnall, Dr. H. J. A. : *Obituary* of Dr. L. C. Thomson, 906
Darwin, Erasmus : The Temple of Nature, or the Origin of Society (in Russian), *review by Dr. S. I. Tomkeieff*, 711
Darwin Revalued (Sir Arthur Keith), *review* by Prof. C. H. Waddington, 989
Dasgupta, B., and others : 'Kernechtrot' or Nuclear Fast Red in the Histochemical Detection of Calcareous Corpuscles in *Taenia saginata*, 701
*Dasyatis uarnak* and *Upeneus moluccensis* in the Eastern Mediterranean : Two Indo-Pacific Fishes, (Dr. A. Ben-Tuvia), 1177
Daumas, Maurice : Lavoisier, *review* by W. A. Smeaton, 896
Dauvillier, Alexandre : Origin of Stellar Systems and Planets, 1199
Davey, J. T. : Distribution and Movements of Populations of Locusts, 590
Davidson, Dr. Charles F. : Appointed to the chair of geology in the University of St. Andrews, 954 ; *work of*, 954
Davidson, Dr. H. R. E. : Disposal of the Dead, and Beliefs in an After-Life, 811
Davidson, J. N. (edited by Chargaff, Erwin, and) : The Nucleic Acids, *review* by Dr. E. Stedman, 801
Davidson, J. P. : The Photonuclear Effect and the Complex Potential-Well Nuclear Model, 649
Davie, Dr. T. B. : *Education and Race Relations in South Africa* (Eleventh Hoernlé Memorial Lecture), 613
Davies, Prof. Arthur : The Last Voyage of John Cabot and the Rock at Grates Cove, 996
Davies, Rt. Hon. Clement : The Effects of Nuclear Weapons, 289
Davies, C. N. : Use and Abuse of Protective Equipment, 1251
Davies, D. D. : Biochemical Activity of Pea-Seedling Mitochondria, 631
Davies, D. E. : *Locust Phases*, 591
Davies, Prof. D. V. : Supra-Sternal Ossicles in Primates other than Man, 1130
Davies, Dr. J. A. : Awarded a renewal of a Ramsay Memorial Fellowship, 336
Davies, J. C. : Appointed entomologist, Department of Agriculture, Uganda, 1248
Davies, L. : Behaviour of Young and Old Females of the Black-fly, *Simulium ornatum* Mg., 979
Davies, M. : Advances in Molecular Spectroscopy, 682
Davies, Dr. N. R. : Organo-Metallic Compounds, 59
Davies, R. Llewelyn, and others : Laboratory Design—Survey of Space and Services Requirements in Two Agricultural Research Laboratories, 999, 1249
Davies, Prof. S. J. : Retirement from the chair of mechanical engineering in King's College, London, 145 ; work of, 145
Davis, Watson : Dissemination of Science, 1008
Davy, John : Land Use in Britain, 338
Davy Medal for 1955 of the Royal Society awarded to Prof. H. W. Melville, 907, 1094
Dawe, P. G. M., and others : New High-speed Electronic Tachistoscope, 231
Dawes, Dr. G. S. : *Pulmonary Circulation and Respiratory Function*, 961
Dawson, Dr. J. W. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Day, A. A., and Runcorn, Dr. S. K. : Polar Wandering—some Geological, Dynamical and Palaeomagnetic Aspects, 422
DDT, *das Insektizid Dichlordiphenyltrichloräthan* und seine Bedeutung (herausgegeben von Dr. Paul Muller), Band I, *review* by Dr. J. R. Busvine, 943
DDT Synergists : A New Group of (Dr. Ernst D. Bergmann, A. S. Tahori, A. Kaluszyner and S. Reuter), 266
de Beer, Sir Gavin : Problems of International Concern in the Biological Sciences, 243
*The Pogonophora*, 888
de Beer, Sir Gavin, and Hey, Max H. : First Ascent of Mont Blanc, 100
De Boer, J., and others (edited by Kronig, R., in collaboration with) : Textbook of Physics (translated from the third Dutch edition), *review* by Prof. G. O. Jones, 184
De Boer, P. B. : Animal Production from Grass, 728
de Borde, H. A. : Appointed a lecturer in natural philosophy at the University of Glasgow, 957
de Carneri, Dr. I. : *Trichomonas hominis* cultured without Bacteria, 605
de Keyser, L. P. : Algal Chemistry, 1107
de Kruyff, C. D. (van der Walt, J. P., and) : Anaerobic Metabolism of Thiocyanate by Thiobacilli, 310
de Mallemann, Prof. R. : Elected a non-resident member of the Paris Academy of Sciences, 1200
de Nobel, D. (*Kroger, Dr. F. A., and*) : *Intermetallic Semiconductors*, 343
de Virville, Dr. A. D. : Botany of Seaweed, 1108
de Waele, A : Surface Rheology, 820
de Whalley, H. C. S. : *Obituary* of Phillip Lyle, 534
de la Mare, Dr. P. B. D. : Theoretical Organic Chemistry, *review*, 991
Dead : Disposal of the, and Beliefs in an After-Life (British Association for the Advancement of Science, Section H (Anthropology and Archaeology), *Discussion on*), 809
Dead Bull Spermatozoa (Live and) : A New Method for Counting (A. D. Bangham and Dr. J. L. Hancock), 656
Dead Spermatozoa : A New Difference between Live and (Dr. J. L. Hancock and L. G. Shaw), 260
Dearnley, D. J. : Cinematography in Scientific Research, 726
Death and the After-Life (L. V. Grinsell), 809
Deb, S. : Awarded the Sir J. C. Bose Premium for 1954 of the British Institution of Radio Engineers, 536
Decarboxylase Catalysed by Extracts of the Silkworm, *Bombyx mori* L. : Studies on Transaminase and (B. Bheemeswar), 555
Decarboxylation of some Oxaloacetates : Carbon-13 Isotope Effects in the (Dr. E. Gelles and Dr. R. I. Reed), 1262
Decarboxylation of Oxaloacetic Acid : Magnetic Catalysis of the (Dr. E. Gelles), 925
Decius, Prof. J. C., and others : Molecular Vibrations, *review* by Dr. J. W. Linnett, 1185
Decomposition of the Propyl Nitrates : Chemiluminescence in the (Dr. Peter Gray and M. W. T. Pratt), 1171
Decomposition Flame of Methyl Nitrite (Dr. Peter Gray, A. R. Hall and H. G. Wolfhard), 695
Deductive Logic : An Introduction to (Prof. Hughes Leblanc), *review* by F. I. G. Rawlins, 1138
Dee, Prof. P. I. : Rutherford Lecture for 1956 of the Physical Society, 241
Deep Body Temperature in the Calf : Comparison of Rectal and (Dr. John Bligh), 402
Deep-Sea Deposits : Cosmic Sources of (Dr. E. J. Öpik), 926
*Defects in Colour Vision* : The Ishihara Test and (Peter Cavanagh), 816
Defence Research in the United States : Organization of, 1012
Defined Media : Influence of Osmotic Pressure on the *Polyamine Requirement* of *Neisseria perflava* and *Pasteurella tularensis* for Growth in (Dr. J. Mager), 933
Definition of the Second of Time : An Atomic Standard of Frequency and Time Interval—(Sir Edward Bullard), 282, *erratum*, 381 ; (Sir H. Spencer Jones), 669 ; (Dr. G. M. Clemence), 1230
Deformation (Mechanical), of Single Crystals of Alkali Halides : Electrical Effects associated with the (J. E. Caffyn and T. L. Goodfellow), 878
Deformation Process in the Torsion of Zinc Crystals : Flexural Rotational Slip as the Main (A. D. Whapham and Dr. H. Wilman), 460
Degraded Gelatine : Mechanical Properties of (P. R. Saunders and A. G. Ward), 26
Degrois, M. (Busnel, R. G., and) : Applications of Ultrasonics, 387
del Castillo, Dr. J. : Quantal Nature of the End-plate Potential, 650
Delinquents (Juvenile), in their Urban Setting, *review* by A. N. Oppenheim, 91
Dellert, Eva E., and *Stahmann*, Dr. Mark A. : Inhibition, Restoration and Enhancement of Proteolytic Action by Polylysine and Polyglutamic Acid, 1028
Delporte, Dr. E. J. : *Obituary* by Dr. J. G. Porter, 1052
Dembowski, Prof. J. : Awarded a Polish Medal for general scientific work, 336
Dempster, J. P. : Estimation of Numbers of Locusts, 590
*Factors in the Fluctuations of Populations of* Locusts, 590
Denbigh, Dr. K. G. : Appointed to the chair of chemical technology in the University of Edinburgh, 583 ; work of, 583
Denervation : Effect of, on the Histochemical Appearance of Cholinesterase at the Myoneural Junction (R. S. Snell and N. McIntyre), 884
Dénes, Dr. Péter : Awarded a second-class Kossuth Prize for Research, 14
Denmark : Congenital Porphyria in Swine and Cattle in (S. K. Jorgensen and *Dr. Torben K. With*), *156*
Density of Amorphous Polyethylene Terephthalate (A. B. Thompson and D. W. Woods), 78
Density of the Lunar Atmosphere : Lunar Occultation of a Radio Star and the Derivation of an Upper Limit for the (B. Elsmore and G. R. Whitfield), 457
Density Inversions in Canadian Eastern Arctic Waters (Dr. M. J. Dunbar), 703
Deoxypentose Nucleic Acids : Macromolecular Weight and Size of (Geoffrey L. Brown, Dr. Marjorie B. M'Ewen and Margaret L. Pratt), *161*
Deoxyribonuclease : Protection of, from Ionizing Radiation by Adsorbents (G. L. Fletcher and S. Okada), 882
*Deoxyribonucleate* (Sodium) : Effects of Gamma-Rays on Solutions of—Possible Chemical Mechanism for their Biological Effects (R. A. Cox, Dr. W. G. Overend, Dr. A. R. Peacocke *and* S. Wilson), 919
Deoxyribonucleic Acid : Action of Ribonuclease on Living Cells *in vitro* and Synthesis of (H. Firket, S. Chèvremont-Comhaire and Prof. M. Chèvremont), 1075
Dissociation of, by Urea (Dr. P. Alexander and Dr. K. A. Stacey), 162
*The Duplication Mechanism of* (Dr. Niels Arley), 465
Deoxyribonucleic Acid Content of Marsupial Nuclei (J. M. Rendel and G. M. Kellerman), 829
Deoxyribonucleic Acid Content of Nuclei in Tail Mesenchyme of *Rana pipiens* Tadpoles (Jerome J. Freed and Elizabeth Ufford Green), 116
Deoxyribonucleic Acid Content of the Nucleus and Nuclear Volume (Prof. J. Fautrez, E. Pisi and G. Cavalli), 311
*Deoxyribonucleic Acid of T2r Bacteriophage* : Fractionation of the (Dr. Geoffrey L. Brown and Dr. Angela V. Martin), 971
Deoxyribonucleoprotein : Characterization and *Total Recovery* of the Component Proteins of a (Dr. G. Toennies and B. Bakay), 696
Deposition Induced by Hydrocortisone of Calcium in the Heart Tissue o Female $C_3H$ Mice (Ardis Lostroh and Prof. Choh Hao Li), 504
Deposits (Deep-Sea) : Cosmic Sources of (Dr. E. J. Öpik), 926
*Derbyshire, R. T. P. : Non-Destructive Testing*, 386
Desai, Dr. A. : Surface Rheology, 819
Deshmukh, D. K., and others : *Minor Oscillations of Magnetographs*, 876
Design : Laboratory—Survey of Space and Services Requirements in Two Agricultural Research Laboratories (R. Llewelyn Davies and J. W. Nightingale, and Norman T. J. Bailey), 999, 1249
Design of Animal Houses (W. A. Hemmings), 527
*Design of Electronic Devices for Production* (*Summer School* at the *Services* Electronics Research Laboratories), 1059
Desoutter, D. M. : English Style in Scientific Papers, *1250*
Destocking of Pastures to aid Control of the Cattle Tick : Temporary (Dr. P. R. Wilkinson), 515
Desty, D. H. : Sorting Molecules, 1108
Detection of Chloride and of certain Purines and Pyrimidines on Paper Chromatograms : *A Reagent for the* (T. Wood), 175
Detection of Labile Photochemical Free Radicals by Paramagnetic Resonance (D. J. E. Ingram, W. G. Hodgson, C. A. Parker and *W. T. Rees*), *1227*
Detector (A New), for Vapour-Phase Partition Chromatography (R. P. W. Scott), 793
Detergents (Synthetic) : Partition Chromatography of (F. Franks), 693
Deterioration of Ceramic Bodies : Expansion and (H. V. Hueber and Angus A. *Milne*), *509*
Determination of Elastic Constants of Solids by Ultrasonic Diffraction Methods (Dr. G. S. Verma), 27
Determination of Mesomorphic and Polymorphic Transition Temperatures : A Projection Instrument to aid in the (Dr. G. W. Gray and A. Ibbotson), 1160
Determination (Colorimetric), of Micro Quantities of Calcium (T. T. Gorsuch and A. M. *Posner*), 268
Determining Particle Size of Powders : A Method of (M. L. Lakhanpal, V. D. Anand and Dr. B. R. Puri), 692
Deuchar, Dr. E. M. : Distribution of Free Amino-Acids in Embryos of *Xenopus laevis*, 258

Deuterons : Neutrons produced in the Bombardment of Beryllium by (Fedor Boreli and Branislav Lalovic), 1021
Deutsche Kunststoff-Institut in Darmstadt : Foundation of the, 288
Development in East Africa, 87
Development : Analysis of (edited by Prof. Benjamin H. Willier, Prof. Paul A. Weiss and Prof. Viktor Hamburger), *review* by Prof. C. H. Waddington, 477
  Immunity and (Prof. F. W. Rogers Brambell), 441
  Immunity and (British Association for the Advancement of Science, Section D (Zoology), Discussion on), 852
  Mechanisms of, *review* by Prof. C. H. Waddington, 477
  Nuclear Research and, 334
Development of the Compound-nucleus Model (Prof. E. P. Wigner), 638
Development of Electronic Devices : Summer School for University and Technical College Teachers on Scientific Problems in the (Admiralty), 102
Development of some Fast-Running Skis : Some Recent Developments in Friction—Friction on Snow and Ice and the (Dr. F. P. Bowden), 946
Development of the Gas Turbine (Sir Harold Roxbee Cox), 1104
Development of Industrial Relations in Britain, 799
Development of Physics : Niels Bohr and the—Essays dedicated to Niels Bohr on the occasion of his Seventieth Birthday (edited by W. Pauli, with the assistance of L. Rosenfeld and V. Weisskopf), *review* by Prof. W. E. Burcham, 1186
Development (Economic), of Basutoland, Bechuanaland and Swaziland, 1158
Development Commission : Appointment of F. S. O. Broughton as secretary, 632
Development and Growth, Society for the Study of : Symposium on the Dynamics of Growth Processes (edited by Edgar J. Boell), *review*, 46
Development and Welfare in the British Colonies, 1158
Devillers, Ch., et autres : Vertébrés—Embryologie, grands problèmes d'anatomie comparée, caractéristiques biochimiques (Traité de Zoologie, publié sous la direction de Pierre-P. Grassé, Tome 12), *review* by Prof. C. H. O'Donoghue, 756
Dewar, Dr. E. T. : Second International Seaweed Symposium, 1106
Di- and Tri-glycerides (Mono-,) : A Simplified Method of preparing Pure (L. Hartman), 1024
Di-isopropyl Fluorophosphate : Inhibition of Complement Activity by (Dr. Elmer L. Becker), 1073
Diameter of Living Bacteria : A Critical Method of Measuring the, with the Interference Microscope (K. F. A. Ross), 1076
Diamonds : Large Type II (Dr. J. F. H. Custers), 360
  Man-made (Dr. F. P. Bundy, Dr. H. T. Hall, Dr. H. M. Strong and Dr. R. H. Wentorf, Jun.), 51
Dible, Prof. J. H. : Title of professor emeritus in the University of London conferred on, 194
ω-(2 : 4 Dichlorophenoxy)alkanenitriles and 3-Indolylacetonitrile within Plant Tissues : Alpha Oxidation of (C. H. Fawcett, B. C. Seeley, F. Taylor, Prof. R. L. Wain and F. Wightman), 1026
2,4-Dichlorophenoxyacetic Acid and Maleic Hydrazide : Effect of, on Potato Proteins as shown by Paper Electrophoresis (Grace K. Yasuda, Merle G. Payne and Jess L. Fults), 1029
Dick, I. D., and others : The Academic Record of Science Students in the University of New Zealand, 448
Dickens, Prof. Frank, and Williamson, D. H. : Transformation of Pentose Phosphates by Enzymes of Animal Origin, 400
Dickson, C. R. : Appointed senior agricultural officer, Gold Coast, 195
Dickson, J. M. : High-Energy Nuclear Physics, 371
Dictionary (Mechanical) : Use of a Computing Machine as a (Dr. Andrew D. Booth), 565 ; (Dr. J. C. Kendrew), 984
Diebold, John : Impact of Science on Management in the Future, 1108
Dielectric Strength of Organic Liquids (H. House), 610
Diet and Disease : Cholesterol and Fat Metabolism in relation to (Scottish Branch of the Nutrition Society and the Biochemical Society Symposium on), 288, 774
Diethyl *p*-Nitrophenylphosphonate : Site of Inhibition of Trypsin by (T. Viswanatha and I. E. Liener), 1120
Difference between Live and Dead Spermatozoa : A New (Dr. J. L. Hancock and L. G. Shaw), 260
Differences in the Effects of Different Sympathomimetic Amines on the Isolated Innervated Rat Diaphragm Preparation : Some (Dr. Katharine A. Montagu), 738
Different Kinds of Insect Traps : Selection of Aphid Species by (V. F. Eastop), 936
Different Sympathomimetic Amines : Some Differences in the Effects of, on the Isolated Innervated Rat Diaphragm Preparation (Dr. Katharine A. Montagu), 738
Diffraction : Neutron (G. E. Bacon), *review* by Dr. H. P. Rooksby, 895
Diffraction (Neutron) : Theory and Practice of, *review* by Dr. H. P. Rooksby, 895
Diffraction (X-Ray) : Ages of Pitchblende by (Dr. B. Wasserstein), 159
Diffraction (X-Ray), in Physical and Chemical Laboratories, *review* by Dr. A. Guinier, 710
Diffraction (X-Ray), by Polycrystalline Materials (edited by H. S. Peiser, Dr. H. P. Rooksby and Dr. A. J. C. Wilson), *review* by Dr. A. Guinier, 710
Diffraction Methods (Ultrasonic) : Determination of Elastic Constants of Solids by (Dr. G. S. Verma), 27
Digby, Adrian : Disposal of the Dead, and Beliefs in an After-Life, 811
Digestion (Selective), of the Neurosecretory Material of the Hypothalamus and of the Neurohypophysis by Tissue Homogenates (A. Berezin, W. A. Hadler and J. H. Tramezzani), 600
Digital Computers of the United States National Bureau of Standards, 1003
Dijkstra, G., and Duin, H. J. : Structure of Sterculic Acid and other Analogous Fatty Acids, 71
Dijkstra, H. : Animal Production from Grass, 729
Dilliard, Irving (collected, and with an Introduction and Notes, by) : The Spirit of Liberty—Papers and Addresses of Learned Hand, *review* by R. Brightman, 525
1 : 8-Dimethyldibenzothiophen in a Kuwait Mineral Oil Fraction (Dr. W. Carruthers), 790
N,N-Dimethylformamide : Molecular Weight of Insulin in (Dr. E. Douglas Rees and Dr. S. J. Singer), 1072
Dingle, Prof. Herbert : Medieval Cosmology, *review*, 45
  Title of professor emeritus in the University of London conferred on, 194
2 : 4-Dinitrophenol : Modification of the After-Potential of Single Muscle Fibres by (Prof. W. V. Macfarlane and J. D. Meares), 403
(L) α-2,4-Dinitrophenylhistidine : Synthesis of (L. K. Ramachandran and W. B. McConnell), 931
Diphtheria Toxin in Submerged Culture : Production of (F. V. Linggood, A. C. Matthews, S. Pinfield, Dr. C. G. Pope and T. R. Sharland), 1128
Diploid Species of Solanum : Overcoming Cross-incompatibility among some Mexican (Dr. M. S. Swaminathan), 887
Diplomas in Technology in Technical Colleges, National Council of : Establishment of a, 146
  Appointment of Lord Hives as chairman, 146
Direct Chemical Treatments : Responses of a Fern Apex to (Prof. C. W. Wardlaw), 1098
D.C. Corona : Positive-Point (Dr. B. Murphy), 397
Direct Interaction between Copper Ions in the Molecules of Copper Acetate and Propionate (Ryutaro Tsuchida and Shoichiro Yamada), 1171
Direct Measurement of the Energy Locally Absorbed from a Gamma-Ray Beam (Prof. H. E. Jones, J. P. Bernier and D. V. Cormack), 560
Direct Spectrophotometric Determination on Paper of Chromatographic Spots of Cobalt and Copper (A. Lacourt and P. Heyndryckx), 880
Direction of Venous Blood-flow in the Mammary Region of the Sheep and Goat : Variations in the (J. L. Linzell and L. E. Mount), 37
Disappearance of Fluorescence in Thionine : Slow, on addition of Abietic Acid (Prof. Santi R. Palit and Byomkesh Biswas), 214
Discovery at Swanscombe, Kent : New, 287
Discrepancy between the Spectro-isotopic and the Mass-Spectrometric Results for the Natural Abundance Ratio of the Lithium Isotopes (A. H. Gillieson and R. P. Thorne), 1228
Disease : Banana Wilt (J. Rishbeth), 1198
  Biological Aspects of the Transmission of (Institute of Biology Symposium on), 493
  Cholesterol and Fat Metabolism in relation to Diet and (Scottish Branch of the Nutrition Society and the Biochemical Society Symposium on), 288, 774
Diseases : Animal and Human, in East Africa (Conference in Kampala), 1153
Diseases (Mental) : Role of 5-Hydroxytryptamine in, and its Antagonism to Lysergic Acid Derivatives (A. Cerletti and Prof. E. Rothlin), 785
Dispersion in Cubic Crystals : Photoelastic (K. S. Iyengar), 1119
Displacement Activities in Fiddler Crabs (Helen R. S. Gordon), 356
Displacements in Structures : Correlation between Calculated and Observed Stresses and (Institution of Civil Engineers Conference on), 149
Disposal of the Dead, and Beliefs in an After-Life (British Association for the Advancement of Science, Section H (Anthropology and Archaeology), Discussion on), 809
Dissemination of Science (Unesco Conference on), 1008
Dissociation of Deoxyribonucleic Acid by Urea (Dr. P. Alexander and Dr. K. A. Stacey), 162
Distillers Co., Ltd., and others : Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
Distortion of the *E* Layer of the Ionosphere by Electrical Currents Flowing in It (Sir Edward Appleton, A. J. Lyon and Mrs. A. G. Turnbull), 897
Distribution of Free Amino-Acids in Embryos of *Xenopus laevis* (Dr. E. M. Deuchar), 258
Distribution of Radiocarbon in Tobacco Mosaic Virus (Miss G. Wittinger, H. Schönfellinger and Prof. E. Broda), 306
Distribution (Approximate Joint Probability), for Wave Amplitude and Frequency in Random Noise (R. A. Wooding), 564
Distribution (Geographical), of Past Floras (W. N. Edwards), 441
Distribution (Widespread), of Mutant Alleles (t-Alleles) in Populations of Wild House Mice (Prof. L. C. Dunn), 1275
Distribution and Abundance of Animals (H. G. Andrewartha and L. C. Birch), *review* by C. S. Elton, 419
Distribution-in-Speed of Fading of 150-kc./s. Waves (R. B. Banerji), 131
Distribution Maps of Scandinavian Species of *Hieracium* (Prof. Gunnar Samuelsson), 240
Distributions of some Vascular Plants : Temperature-Ranges and (E. P. Jeffree), 703
Ditchburn, Prof. R. W. : Radiative Balance in the Atmosphere, 636
Dividing Machine : Evolution of the (Special Exhibition at the Science Museum, London), 632
Dixon, D. : Appointed a lecturer in natural philosophy at the University of Glasgow, 957
Dixon, Dr. Jonathan S., and others : Amino-Acid Sequence of Alpha-Corticotropin, 687
Dixon, Dr. M. : Physical Chemistry of Enzymes, 958
Dobry, Alan : Effect of Chelating Agents on Heterogeneous Catalysis, 266
Dobson, Prof. G. M. B. : Radiative Balance in the Atmosphere, 636
Documentation of Applied Chemistry : First International Congress on, 956
Documentation of Spectra by Punched Cards (Butterworths Scientific Publications and Verlag Chemie), 724
Dodd, Dr. C. : The Bubble Chamber, 142
Dodds, Dr. J. M. : Design of Electronic Devices for Production, 1059
Dodson, Prof. E. O. : Life and Work of Gregor Johann Mendel, 1151
Doell, Dr. R. R. : Appointed an assistant professor in the Department of Geology and Geophysics, Massachusetts Institute of Technology, 1104
  Palaeomagnetic Study of Rocks from the Grand Canyon of the Colorado River, 1167
Dog : Metabolism of Two Aromatic Amines in the (L. Bradshaw and Dr. D. B. Clayson), 974
Dogiel, Prof. V. A. : *Obituary* by Dr. C. A. Hoare, 627
Dogniaux, R. : Observations of the Solar Radiation during the Eclipse of the Sun on June 30, 1954, 1103
Dogs (Hepatectomized) : Release of Histamine in, during Anaphylactic, Peptone and Tryptic Shock (H. Mossatché), 648
Dollimore, Dr. D. : Surface Rheology, 819
Domestic Animals in the Gold Coast : Blood Counts in (Prof. E. E. Edwards, J. M. Judd and F. A. Squire), 549
Donald, Prof. I. : Pulmonary Circulation and Respiratory Function, 961
Donald, Dr. K. W. : Pulmonary Circulation and Respiratory Function, 960
Doncaster, J. P. : Appointed a deputy keeper in the Department of Entomology, British Museum (Natural History), 1249

Dorey, Dr. S. F.: The Influence of the Engineer on Sea Transport and Trade (Presidential Address to Section G (Engineering) of the British Association for the Advancement of Science), 442
Dorman, A. E.: Appointed provincial veterinary officer, Kenya, 1248
Dosage Sprayer (A Variable), for Agricultural Experiments (Dr. R. Pfeiffer, R. T. Brunskill and Dr. G. S. Hartley), 472
Double-Illumination Microscopy (Prof. M. A. MacConaill), 877
Double Reduction at the Rosy, or Pink, Locus in *Lythrum salicaria* (Sir Ronald Fisher and V. C. Fyfe), 1176
Dougall, D., and Abraham, Dr. E. P.: Xanthomycin A, 256
Douglas, Dr. C. G.: Energy Expenditure by Man, 951
Douglas, H.: Appointed a member of the Advisory Council for Scientific and Industrial Research, 677
Doull, K. M.: An Electrified Barrier for Caterpillars, 842
Dounce, Dr. Alexander L.: Obituary of Prof. James B. Sumner, 859
Dounce, Dr. Alexander L., and others: Role of Nucleic Acid and Enzymes in Peptide Chain Synthesis, 597
Dow Chemical Co., *Michigan*: *Gift of* 6,000 dollars to the Department of Physical Chemistry, University of Leeds, for further research in paramagnetic resonance, 1055
Dowell, M. H. D.: Appointed assistant conservator of forests, Nyasaland, 910
Downe, A. E. R.: Inhibition of the Production of Precipitating Antibodies in Young Rabbits, 740
Downs, B. W.: Appointed to a Research Fellowship in mathematical physics at the University of Birmingham, 862
Dracott, D., and others: Langmuir's Paradox, 916
Draganic, I.: Chemical Effects of Ionizing Radiation, 197
Draper, Charles Stark, and others: Instrument Engineering, Vol. 1, Methods for Describing the Situations of Instrument Engineering; Vol. 2, Methods for Associating Mathematical Solutions with Common Forms, *review* by Dr. G. D. S. MacLellan, 275
Drar, Mohammed (Täckholm, Vivi, and): Flora of Egypt, Vol. 3, Angiospermae, part Monocotyledones, Liliaceae–Musaceae, 101
Drawings: A Caliper for Measuring Photographs, X-Rays and (J. M. Tanner and R. H. Whitehouse), 1180
Drayton Experimental Husbandry Farm: Appointment of S. Culpin as director, 102
Drew, Dr. Kathleen M.: The Institute of Seaweed Research, 155
Drewry, J. (Aschaffenburg, Dr. R., and): Occurrence of Different Beta-Lactoglobulins in Cow's Milk, 218
Dreyer, W. J. (Neurath, H., and): *Physical Chemistry of Enzymes*, 958
Drilling: Metallic Transfer in, and its Significance in Orthopaedic Surgery (Dr. F. P. Bowden, J. B. P. Williamson and P. G. Laing), 826
Dron, R. W. N.: Awarded a Mond Nickel Fellowship, 770
Droplets (Oscillating), and Spontaneous Emulsification (Dr. D. A. Haydon), 839
Drops (Liquid): Erosion of Surfaces by (D. C. Jenkins), 303
Drummond, Sir Walter: Appointed a Department of Scientific and Industrial Research visitor to the Electrical Research Association, 1056
Drummond Fellowships for Research in Nutrition (University College, London), 1249
Dryden, I. G. C.: *Coal Science*, 104
Drying Conditions: The Effect of certain, on the Putrefaction of Cattle Hides and Goatskins (Dr. M. H. French and Dr. R. L. Sykes), 297, 725
Drysdale, A. D.: Awarded a postgraduate scholarship in husbandry by the Department of Agriculture for Scotland, 677
D'Silva, Prof. J. L.: Pulmonary Circulation and Respiratory Function—Symposium in Dundee, 960
Du Bois, P. M.: Palaeomagnetic Measurements of the Keweenawan, 506
DuShane: Prof. G.: Appointed Editor of Science and Scientific *Monthly*, 722; works of 722
du Vigneaud, Prof. Vincent: Advances in Organic Chemistry, 760
  Awarded the Nobel Prize for Chemistry for 1955, 1053
Dube, S. S. (Mitra, Prof. R. P., and): Acid Character of some Phenolic Resins in relation to their Structure, 79
Duchesne, Prof. J.: Appointed to the visiting professorship of Belgian studies in the University of London, 194
Duckworth, Prof. Henry E., and others: Reliability of Atomic Masses in the Chromium–Germanium Region, 458
Duculot, C.: Advances in Molecular Spectroscopy, 682
Duddell Medal for 1956 of the Physical Society awarded to Prof. J. G. Gaunt, 241
Duff, Sir James: Foundations of Freedom—the New Universities Overseas, 675
Duffy, —.: Non-Destructive Testing, 385
Dufraisse, C.: Advances in Organic Chemistry, 759
Dugdale, Sir Thomas: Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1203
Duhem, Prof. Pierre: Le Système du Monde, Tome 6, *review* by Prof. Herbert Dingle, 45
Duin, H. J. (Dijkstra, G., and): Structure of Sterculic Acid and other Analogous Fatty Acids, 71
Dunbar, Dr. M. J.: Density Inversions in Canadian Eastern Arctic Waters, 703
Duncalfe, Sir Roger: Re-elected president of the British Standards Institution, 862
Duncan, W. F.: Awarded a Mond Nickel Fellowship, 770
Duncanson, L. A.: Advances in Molecular Spectroscopy, 681
Dunjic, A., and others: Progress in Radiobiology, 683
Dunkerley, B. D., and Lipson, Prof. H.: A Simple Version of Bragg's X-Ray Microscope, 81
Dunn, Prof. L. C.: Widespread Distribution of Mutant Alleles (*t*-Alleles) in Populations of Wild House Mice, 1275
Dunn, T. M., and Ingold, Prof. C. K.: Symmetry of the Second Excited Singlet State of Benzene, 65
Dunsford, I.: Blood for Transfusion Purposes, 731
Dunstan, Dr. A. E. (edited by Brooks, Dr. B. T., and): The Science of Petroleum, Vol. 5, Part 3, Refinery Products, *review* by Lieut.-Colonel S. J. M. Auld, 522
Duplication Mechanism of Deoxyribonucleic Acid (Dr. Niels Arley), 465
Durant, Dr. H.: Attitudes, Opinions and Behaviour, 450
Durham, Prof. J. W.: Geological, Dynamical and Palaeomagnetic Aspects of Polar Wandering, 422
Durie, E. B., and Frey, Dr. D.: Isolation of *Microsporum gypseum* and of *Keratinomyces ajelloi* from Australian Soil, 936
Durif, S.: *Coal Science*, 105
Durnin, J. V. G. A.: Energy Expenditure by Man, 952
Dury, Dr. G. H.: Bed-width and Wave-length in Meandering Valleys, 31
Dust and Health in Industry (British Association for the Advancement of Science, Section I (Physiology), Discussion on), 761
Dutton, Dr. J., and others: Growth of Pre-Breakdown Ionization Currents in Hydrogen, 1079
Duveen, Denis I., and Klickstein, Herbert S.: A Bibliography of the Works of Antoine Laurent Lavoisier, 1743–1794, *review* by Sir Harold Hartley, 412
Dyeing and Finishing To-day: Bleaching, (Society of Dyers and Colourists Symposium on), 149
Dyers and Colourists, Society of: Symposium on Bleaching, Dyeing and Finishing To-day, 149
Dynamical and Palaeomagnetic Aspects of Polar Wandering: Geological, (Department of Geodesy and Geophysics of the University of Cambridge Colloquium on), 422
Dynamics of Growth Processes (edited by Edgar J. Boell), *review*, 46
Dynamics (Gas), and Combustion: Physical Measurements in (edited by R. W. Ladenburg, B. Lewis, R. N. Pease and H. S. Taylor), *review* by Dr. A. G. Gaydon, 1040
Dyson, Sir George: State Aid to Museums in Great Britain, 246
Dystrophic Calcification of Cardiac Muscle in Mice: Production of, by Hydrocortisone (Lowell L. Sparks, Werner Rosenau, Rex N. MacAlpin, Thomas A. Deane and Prof. Choh Hao Li), 503

E LAYER of the Ionosphere: Distortion of the, by Electrical Currents Flowing in it (Sir Edward Appleton, A. J. Lyon and Mrs. A. G. Turnbull), 897
fEs during Solar Eclipses: Variation of (W. Stoffregen), 610
Eagle: The Golden—King of Birds (Seton Gordon), *review* by Sir Norman Kinnear, 1091
Eagle (Golden), in America (Lee W. Arnold), 247
Eales, Dr. N. B.: Marine Biological Research, 108
Eames, Prof. A. J., and MacDaniels, Prof. L. H.: Protoplasts in 'Mature' Wood Elements, 39
*Ear Formation in Timothy Grass* (*Phleum pratense*) following Vernalization and Short-day Treatments (Dr. R. H. M. Langer), 263
Early Primates: A New Family of, 500
Earth: Seismicity of the, and Associated Phenomena (B. Gutenberg and C. F. Richter), second edition, *review* by Ernest Tillotson, 617
  The Shape of the (G. Tiercy), 1004
Earth Sciences: Vannevar Bush Fellowships in (Massachusetts Institute of Technology and the Carnegie Institution of Washington), 1102
Earth Tilts in the British Isles connected with Far Distant Earthquakes (Prof. R. Tomaschek), 24
Earth's Axis: Instability of the (Dr. C. B. Goodhart), 349; (Dr. H. Hamshaw Thomas), 349
Earth's Magnetic Field: A Measurement of the, by Nuclear Induction (G. S. Waters), 691
Earth's Upper Atmosphere: Exploration of the, using High-Altitude Rockets—British Research Programme (Sir David Brunt), 282
Earth (Rare-) Elements: Separation of (Dr. M. Lederer), 462
Earth (Rare-) Mineral from Queensland: Stillwellite, a New (Dr. J. McAndrew and Dr. T. R. Scott), 509
Earthquake Geography, *review* by Ernest Tillotson, 617
Earthquakes: Earth Tilts in the British Isles connected with Far Distant (Prof. R. Tomaschek), 24
  Magnitude and Energy of (Prof. B. Gutenberg and Prof. C. F. Richter), 795
  Recent, 493
East (Middle): Oil in the (Stephen Hemsley Longrigg), *review* by H. B. Milner, 481
East (Near and Middle): Proceedings of the Conference on the Conservation of Nature in the (Unesco), 58
East Africa: Animal and Human Diseases in (Conference in Kampala), 1153
  Development in, 87
  Education in, 536
East Africa High Commission: Appointment of G. H. Lampkin as research officer, East African Agriculture and Forestry Research Organization, 16
  Appointment of J. R. Baker as scientific officer (protozoologist), East African Tsetse and Trypanosomiasis Research and Reclamation Organization, 195
  Retirement of Dr. H. H. Storey as deputy director of the East African Agriculture and Forestry Research Organization, 333
  Appointment of Dr. H. C. Pereira as deputy director of the East African Agriculture and Forestry Research Organization, 334
  Appointment of P. Isherwood as scientific officer, entomologist, 1249
  Appointment of M. T. Ashcroft as medical research officer, grade 2, 1249
  Appointment of D. J. Garrod as scientific officer, East African Fisheries Research Organization, 1249
  Appointment of Dr. E. W. Russell as director, East African Agriculture and Forestry Research Organization, 1249
East Africa Royal Commission: 1953–55 Report, 87
East and Central Africa: Research on the Tropical Swamps of, 536
East African Agriculture and Forestry Research Organization: Appointment of G. H. Lampkin as research officer, 16
  Retirement of Dr. H. H. Storey as deputy director, 333
  Appointment of Dr. H. C. Pereira as deputy director, 334
  Appointment of Dr. E. W. Russell as director, 1249
East African Fisheries Research Organization: Appointment of D. J. Garrod as scientific officer, 1249
East African Medical Research Scientific Advisory Committee: Zoonoses Conference, 1153
East African Tsetse and Trypanosomiasis Research and Reclamation Organization: Appointment of J. R. Baker as scientific officer (protozoologist), 195
East Malling Research Station: Open Day, 902
  Report for 1954, 1254

East Midlands Regional Advisory Council for the Organization of Further Education in the, and the North Midland Regional Council of the Federation of British Industries: Report of the Conference on Industry and Technical Education, 821
Eastern Arctic Waters (Canadian): Density Inversions in (Dr. M. J. Dunbar), 703
Eastern Mediterranean: Two Indo-Pacific Fishes, *Dasyatis sarnak* and *Upeneus moluccensis*, in the (Dr. A. Ben-Tuvia), 1177
Eastop, V. F.: Selection of Aphid Species by Different Kinds of Insect Traps, 936
Easty, Dr. G. C., and Ambrose, Dr. E. J.: Combined Amino-Acid Content of Tumour and Homologous Normal Tissue, 1256
Eaton, Prof. V. E.: Presented with the Oersted Medal of the American Association of Physics Teachers, 638
Ebashi, Dr. S., and others: Essential Relaxing Factor in Muscle other than Myokinase and Creatine Phosphokinase, 166
Ebert, Prof. James D.: Appointed director of the Department of Embryology of the Carnegie Institution of Washington, 767; work of, 767
Ebert, Dr. Michael, and Howard, Dr. Alma: Progress in Radiobiology—Conference at Cambridge, 683
    Modification of X-Ray Sensitivity of Bean Roots by Hydrogen Gas, 828
Ebert, Dr. M., and Howard-Flanders, P.: Radiation Chemistry of Solutions, 197
Eclipse (Lunar): Photometric Studies of a, 817
Eclipse of the Moon on January 18–19, 1954: Observation of the Total (M. Golay), 817
Eclipse of the Sun on June 30, 1954: Observations of the Solar Radiation during the (R. Dogniaux), 1103
Eclipses (Solar): Variation of fEs during (W. Stoffregen), 610
Eclipses (Solar), and the Ionosphere (Mixed Commission on the Ionosphere of the International Council of Scientific Unions Symposium on), 947
Ecological Research, Indian Council of: Foundation of the, 1152
Ecology of Arid Zones, 776
Ecology of Livestock Productivity: Ecology of Snowdonia—(R. Elfyn Hughes), 595
Ecology of Snowdonia—Ecology of Livestock Productivity (R. Elfyn Hughes), 595; Wild White Clover in Natural Mountain Grassland (A. D. Bradshaw and Tom Pritchard), 596
Economic Development of Basutoland, Bechuanaland and Swaziland, 1158
Economic Development (World): Past and Future Trends in (Sir George Nelson), 1207
Economic Factors in World Peace, 239
Economic Order: The Reconciling Spirit and the (Prof. C. F. Carter), 239
Economics of the Press in Great Britain, 955
Ectotrophic Mycorrhizal Mycelia: Isolation of, from Rhizomorphs present in Soil (Dr. Ida Levisohn), 519
Eddington Medal for 1955 of the Royal Astronomical Society presented to Prof. H. C. van de Hulst, 378
Eddington Memorial Lecture: Ninth (Prof. R. B. Braithwaite), 632
Edels, Dr. H., and others: High-Pressure Glow-to-Arc Transitions with Tungsten and Copper Cathodes, 28
Eden, Dr. R. J.: Canadian Colloquium on Theoretical Physics, 588
Edgar, Janice, and others: Mode of Action of isoNicotinic Hydrazide, 34
Edge, Colonel R. C. A.: Work done by the Ordnance Survey with Electronic Computing, 1058
Edgell, W. F.: Advances in Molecular Spectroscopy, 681
Edholm, Prof. O. G.: Energy Expenditure by Man, 951
Edholm, Prof. O. G. (Burton, Prof. Alan C., and): Man in a Cold Environment, *review* by Dr. J. R. Brown, 849
Editors, The: Air Pollution, 85
Edmond, J. T. (Barrie, Dr. R., and): Intermetallic Semiconductors, 342
Edmonds, P. J.: English Style in Scientific Papers, 1250
Edney, Dr. E. B.: Appointed to the chair of zoology in the University College of Rhodesia and Nyasaland, 98; work of, 98
Edson, Dr. E. F.: Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Educated Man in 1955 (J. F. Wolfenden), 446
Education in East Africa, 536
Education in England and Wales during 1954, 867
Education in 1954 (Report of the Ministry of Education and the Statistics of Public Education for England and Wales), 867
Education: Adult (Prof. A. J. Allaway), 177
    The Impact of, on Farming (W. B. Mercer), 446
    Purpose in, *review* by T. H. Hawkins, 1087
    Visual (*Health Education Journal*, Vol. 13, No. 1, Symposium on), 537
Education, Ministry of: Report of the Working Party on Grants to Training College Students, 295
    Education in 1954, 867
Education (Adult), National Institute of: Report on Liberal Education in a Technical Age, 343
Education (Adult), Universities Council for: Report for 1953–54, 686
Education (Further), in the East Midlands, Regional Advisory Council for the Organization of, and the North Midland Regional Council of the Federation of British Industries: Report of the Conference on Industry and Technical Education, 821
Education (Further), and Training: Liberal Values in, 343
Education (Higher), in the Colonies, 1198
Education (Higher Technological), in Britain, 1085
Education (Higher Technological), in South-East England, 146
Education (Higher Technological), London and Home Counties Regional Advisory Council for: Sixth Annual Report, 146
Education (Liberal), in a Technical Age (National Institute of Adult Education Report), 343
Education (Medical), in the United States (Commonwealth Fund Grants for), 1102
Education (Scientific), in Schools: Industrial Fund for the Advancement of, 860
Education (Technical): Industry and (Report of the Conference organized by the Regional Advisory Council for the Organization of Further Education in the East Midlands and the North Midland Regional Council of the Federation of British Industries), 821
Education (Technical), in Great Britain, 1247
Education (University): The Broadening of, 1
    The Purpose of, 707
Education of the Physicist (British Association for the Advancement of Science, Section L (Education), Discussion on), 678
Education and the Modern Mind (Prof. W. R. Niblett), *review* by T. H. Hawkins, 1087
Education and Race Relations in South Africa (Dr. T. B. Davie), 613
Education and Social Change in Tropical Areas (Prof. Margaret Read), *review* by R. Brightman, 757
Education and Social Development in the Colonies, *review* by R. Brightman, 757
Education and Training of Graduate Staff for Industrial Research (Fourth Conference of Industrial Research Directors and Managers), 141
Education and the Universities, 661
Educational Policy and Man-power, 475
Educational Problems of the Colonial Territories, 319; (Prof. J. B. S. Haldane), 750
Edmunds, F. H.: Soil Mechanics, Geology and Civil Engineering, 715
Edwards, Prof. E. E., and others: Blood Counts in Domestic Animals in the Gold Coast, 549
Edwards, George: Isotopic Composition of Meteoritic Hydrogen, 109
Edwards, W. N.: Geographical Distribution of Past Floras (Presidential Address to Section C (Geology) of the British Association for the Advancement of Science), 441
Edwards High Vacuum (London), Ltd.: Leaflet E.156/1, New Model of the Cold-Cathode Type of Electron Diffraction Camera, 817
Effective Gas Diffusion Coefficients: Anisotropy, of, in Extruded Carbon Rods (P. L. Walker, Jun., Frank Rusinko, jun., and Emile Raats), 1167
Effective Use of Man-power (Alec Rodger), 444
Egan, M. J., and Jobling, A.: Formation of Tubes by a Simple Rolling Action—a New Normal-Pressure Effect, 689
Egedal, J.: Solar Eclipses and the Ionosphere, 948
Egerton, Sir Alfred: Scientific Research in India (Thomas Holland Memorial Lecture), 492
Eggs of *Hydroides norvegica* in the Mediterranean: Mode of Cleavage of the (Prof. Alexander Wolsky), 75
Egypt: Flora of, Vol. 3, Angiospermae, part Monocotyledones, Liliaceae–Musaceae (Vivi Täckholm and Mohammed Drar), 101
Egyptian Scientific Papers: Classified List of, Vol. 3 (1953), (National Research Council of Egypt), 676
Ehrenberg, Anders, and Theorell, Prof. Hugo: Stereochemical Structure of Cytochrome c, 158
Ehrenberg, L.: Progress in Radiobiology, 683
Ehrlich Ascites Tumour Cells: Separation of, from other Cellular Elements (Prof. Per Eric Lindahl and George Klein), 401
Eibl-Eibesfeldt, Dr. L.: Cinematography in Scientific Research, 727
Eiby, G. A.: New Zealand Crustal Structure, 32
*Eimeria tenella*: Synergism in the Chemotheraphy of (L. P. Joyner and S. Brian Kendall), 975
Eisenberg, P.: Cavitation in Hydrodynamics, 808
Eiszeitalter: Das (Dr. Paul Woldstedt), Band 1, Die allgemeinen Erscheinungen des Eiszeitalters, zweite Auflage, *review* by D. F. W. Baden-Powell, 572
Eitel, Wilhelm: The Physical Chemistry of the Silicates, *review* by Dr. R. C. Mackenzie, 47
Elastic Constants of Solids: Determination of, by Ultrasonic Diffraction Methods (Dr. G. S. Verma), 27
'Elastin': Apparent Transformation of Collagen into (Prof. D. Burton, Dr. D. A. Hall, Dr. M. K. Keech, Dr. R. Reed, Miss H. Saxl, Prof. R. E. Tunbridge and Miss M. J. Wood), 966
Eldjarn, L., and Pihl, A.: Progress in Radiobiology, 683
Electric Strength of Irradiated Polythene (K. H. Stark and C. G. Garton), 1225
Electric Traction (R. Brooks), 1056
Electric and Magnetic Properties of Thin Films, *review* by Prof. L. F. Bates, 416
Electrical Currents Flowing in it: Distortion of the *E* Layer of the Ionosphere by (Sir Edward Appleton, A. J. Lyon and Mrs. A. G. Turnbull), 897
Electrical Effects associated with the Mechanical Deformation of Single Crystals of Alkali Halides (J. E. Caffyn and T. L. Goodfellow), 878
Electrical Engineering at Birmingham, 907
Electrical Engineering at Swansea, 430
Electrical Engineers, Institution of: Coopers Hill War Memorial Prize and Medal awarded to D. McDonald, 16
    Christmas Lecture for School Children on Electric Traction (R. Brooks), 1056
    Inaugural Address as president (Sir George Nelson), 1207
Electrical Engineers, Institution of, and others: First Meeting of the British Nuclear Energy Conference, 956
Electrical Research Association: Gift of £350 to the Department of Chemistry, University of Birmingham, for research on the fundamental characteristics of the oxidation of certain liquid hydrocarbons, 1055
    Appointment of Sir Walter Drummond and Prof. N. F. Mott to be the Department of Scientific and Industrial Research visitors, 1056
Electrical Standards and Metering (Exhibition at the Science Museum, London), 148
Electricity: A Guidebook to (J. H. M. Sykes), *review* by G. R. Noakes, 1089
    The Teaching of, with special reference to the Use of M.K.S. Units (Science Masters' Association), *review* by Prof. L. F. Bates, 617
    Thunderstorm (edited by Horace R. Byers), *review* by Dr. J. Alan Chalmers, 573
Electricity for the Uninitiated, *review* by G. R. Noakes, 1089
Electricity (Applied), at Bangor, 334
Electricity Authority, Central: Gift of £800 to the Department of Electrical Engineering, University of Birmingham, to continue research work on electrostatic precipitation of dust, 1055
Electrified Barrier for Caterpillars (K. M. Doull), 842
Electrode (Negative): Localized Corona Discharges at a (J. S. T. Looms), 977
Electrodeposited Copper: Growth Spirals in (H. J. Pick), 693
Electrolytes (Cellular), and Adrenal Steroids (Dr. E. Sherwood Jones), 269
Electromagnetic Theory (Prof. V. C. A. Ferraro), *review* by E. Wild, 1237
Electromagnetism: Classical, *review* by E. Wild, 1237
Electron (Unpaired): A New Class of Compounds containing the Pentacyanoferrate Group and an (Dr. E. F. G. Herington), 80

Electron Micrographs from Thick Oxide Layers on Aluminium (C. J. L. Booker, J. L. Wood and A. Walsh), 222
Electron Microscopic Observation of Monolayers of Synthetic Linear Polymers (Taro Tachibana, Kiyoshi Inokuchi and Teiko Inokuchi), 1117
Electron Microscopic Observations on the Structure of the Sieve Plates in *Cucurbita* (C. E. L. Hepton, Prof. R. D. Preston and G. W. Ripley), 868
Electron Microscopy of Textile and other Industrial Fibres (Electron Microscopy Group of the Institute of Physics Conference on), 632
Electron Transport System in Mitochondria: Effects of Adenosine Triphosphate and Metals upon an (Frederic L. Hoch and Bert L. Vallee), 256
Electronic Computer for the Meteorological Office, 1054
Electronic Computer for the Evaluation of Results of Filter-Paper Electrophoresis (M. D. Paulik and L. Pinteric), 1226
Electronic Devices: Summer School for University and Technical College Teachers on Scientific Problems in the Development of (Admiralty), 102
Electronic Devices for Production: Design of (Summer School at the Services Electronics Research Laboratories), 1059
Electronic Engineering at Liverpool, 953
Electronic Tachistoscope: New High-speed (Prof. George Humphrey, P. G. M. Dawe and Bernard Mandell), 231
Electronics: Radio, Television and (Radio Industry Council premiums for articles on), 1153
*Electronics, Journal of*, 585
Electrophoresis on *Agar Plates: Quantitative Separation of B Vitamins by* (Dr. G. Marten), 1064
Electrophoresis (Filter-Paper): *An Electronic Computer for the Evaluation* of Results of (M. D. Paulik and L. Pinteric), 1226
Electrophoresis (Paper): Effect of 2,4-Dichlorophenoxyacetic Acid and Maleic Hydrazide on Potato Proteins as shown by (Grace K. Yasuda, Marie G. Payne and Jess L. Fults), 1029
Electrophoresis (Paper), of Amino-Acids and Oligopeptides at Very High *Potential Gradients* (Dr. D. Gross), 72
Electrophoresis (Paper), of Polyhydric Alcohols (Dr. D. Gross), 362
*Electrophoresis (Paper Protein)*: Accuracy and Reproducibility of (R. A. Neely and D. W. Neill), 33
Electrophoretic Measurement of the True Zeta-Potential of Arsenious Sulphide Sol in the Region of Slow Coagulation (Prof. B. N. Ghosh and K. C. Ray), 1080
Element 101, Mendelevium, Symbol Mv, 586
Elementary Bodies in Bovine Malignant Catarrh (D. Danskin), 518
Elements (Rare-Earth): Separation of (Dr. M. Lederer), 462
Elephant Seals: Reproductive Organs of Foetal and Juvenile (W. Nigel Bonner), 982
Eley, Prof. D. D.: Physical Chemistry of Enzymes—Faraday Society Discussion, 958
Elias, Prof. P.: Information Theory, 774
Eliassaf, J., and others: Negative Thixotropy of Aqueous Solutions of Polymethacrylic Acid, 1119
Elimination of Adrenaline and Noradrenaline from the Circulating Blood (Dr. Olov Celander and Stefan Mellander), 973
Ellingham, Dr. H. J. T.: *Obituary* of R. L. Collett, 582

Esteve, Dr. A.: Awarded a Ramsay Memorial Fellowship for 1955–56, 336
Estimating Vitamin $B_{12}$: Biological and Microbiological Methods of (Biological Methods Group of the Society for Analytical Chemistry Conference on), 384
Ether Bottles: Sodium in Empty (D. Rainy Brown), 448
Ethyl α-Fluoroacetoacetate (R. R. Fraser and Dr. F. L. M. Pattison), 696
Ethylene Glycol: Nature of Calcium Sulphate Gels in (J. Cano Ruiz and Dr. Douglas C. M. MacEwan), 1169
Ethylene Polymer: Observations of Spiral Growth in (Ralph Jaccodine), 305
*Eubothrium crassum* (Bloch): Maturation Divisions of the Ova in the Pseudophyllidean Cestode (Dilys Rawson), 167
Eugenics: The Prospects for (Prof. J. B. S. Haldane), 769
Euphausiacea: Systematic Position of the (Dr. Isabella Gordon), 934
Europe: Occurrence of Attenuated Strains of Myxoma Virus in (Prof. Frank Fenner and I. D. Marshall), 782
Europe (North-West): Vascular Plants of (Nils Hylander), 492
European Association of Animal Production: Fifth 'Study Meeting' (Animal Production from Grass), 728
European Association of Exploration Geophysicists: Ninth Meeting, 957
European Molecular Spectroscopy Group: Meeting in the University of Oxford, 16, 680
European Organization for Nuclear Research at Geneva: Foundation-Stone Ceremony, 93
Evaluation of Grassland: Utilization and (British Association for the Advancement of Science, Section M (Agriculture), Discussion on), 764
Evaluation of Methods in Applied Psychology and the Problem of Criteria (Symposium at the Twelfth International Congress of Applied Psychology), 449
Evaluation of Results of Filter-Paper Electrophoresis: An Electronic Computer for the (M. D. Paulik and L. Pinteric), 1226
Evans, A. C.: Appointed assistant director (research), Tanganyika, 910
Evans, D. C. P.: Appointed senior agricultural officer, Gold Coast, 1248
Evans, Dr. D. F.: Photomagnetism of Triplet States of Organic Molecules, 777
Evans, Howard: Obituary by Dr. W. Steven, 722
Evans, J. H., and others: Awarded the Brabazon Premium for 1954 of the British Institution of Radio Engineers, 536
Evans, J. V., and King, J. W. B.: Genetic Control of Sodium and Potassium Concentrations in the Red Blood Cells of Sheep, 171
Evans, Dr. U. R.: Reactivity of Freshly Formed Steel Surfaces, 750
Evaporation of Water from Soil under Field Conditions (G. Stanhill), 62
Everest (Mount) Foundation (Royal Geographical Society and the Alpine Club), 239
Evison, Dr. F. F.: A Coal Seam as a Guide for Seismic Energy, 1224
Evolution of the Dividing Machine (Special Exhibition at the Science Museum, London), 632
Evolution in Lake Nyasa: Predation Pressure and (G. Fryer and T. D. Iles), 470
Ewart, Dr. W. B.: Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Excavations at Kirkstall Abbey, near Leeds (Thoresby Society), 240
Excavations at Star Carr, an Early Mesolithic Site at Seamer, near Scarborough, Yorkshire (Prof. J. G. D. Clark), *review* by G. F. Mitchell, 91
Exchange of Characters (Apparent Reciprocal), between the *Mel* and *NWS* Strains of Influenza A Virus in the Brain of One-day Old Mice (Dr. K. B. Fraser), 212
Excited State of the Fluorine-19 Nucleus: Magnetic Moment of an (Dr. P. B. Treacy), 923
Excretion (Sodium): Effect of Isolated Cerebral Hypoxia and Hypercapnia on (M. Földi, A. G. B. Kovách and L. Takács), 120
Exelby, K. A.: Appointed chemist, Government Chemist Department, Tanganyika, 195
Exercise (Physical): Significance of Glutamic Acid in Metabolic Processes in the Rat Brain during (Dr. R. Vrba), 1258
Exertion (Physical): A Source of Ammonia and Changes of Protein Structure in the Rat Brain during (Dr. R. Vrba), 117
Exhibition of 1851, Royal Commission for the: Awards for 1955, 58
Expansion (Secondary), of Perlite Concrete and Plaster (R. D. Hill), 29
Expansion (Thermal), of Coal (J. C. Macrae and C. Ryder), 265; (A. S. Joy), 924
Expansion and Deterioration of Ceramic Bodies (H. V. Hueber and Angela A. Milne), 509
Expenditure in the United Kingdom, 1900–1919: Consumers' (A. R. Prest, assisted by A. A. Adams), *review*, 4
Expenditure and Behaviour in the United Kingdom, 1920–1938: The Measurement of Consumers' (Richard Stone), Vol. 1, *review*, 4
Experiment in Physical Chemistry: The Relation between Theory and (Prof. E. A. Guggenheim), 586
Experimental Biology: Cambridge Monographs in, *review* by Prof. J. F. Danielli, 136
Experimental Physics: Introduction to (Prof. William B. Fretter), *review* by Prof. H. W. B. Skinner, 942
Experimental Skin Graft: Influence of Cortisone on Connective Tissue—Epithelial Relations in Wound Healing, Hair Regeneration and the Pathogenesis of (Prof. Theodore Gillman; Jack Penn, Doris Bronks and Marie Roux), 932
Experimentally Induced Twinning in Plants (Dr. Barbara Haccius), 355
Experiments on the Complete Suppression of Stammering (Dr. E. Colin Cherry, B. McA. Sayers and Pauline M. Marland), 874
Experiments in Friction: Some Recent—Friction of Solids at High Speeds (Dr. F. P. Bowden and E. H. Freitag), 944; Friction on Snow and Ice and the Development of some Fast-Running Skis (Dr. F. P. Bowden), 946
Exploration of the Earth's Upper Atmosphere using High-Altitude Rockets—British Research Programme (Sir David Brunt), 282
Exploration (Scientific), of the Belgian African National Park of the Garamba (Dr. Tracy Philipps), 1011
Exploration Geophysicists, European Association of: Ninth Meeting, 957
Explosions: Thermonuclear, 1151
Explosions (Nuclear): Genetical Effects of Radiation from Products of (Prof. J. B. S. Haldane), 115; (Sir John Cockcroft), 115
Extra-Terrestrial Radio Noise: Discrete Sources of (International Scientific Radio Union, Special Report No. 3), 1110
Extract of *Adhatoda vasica*: Antitubercular Effect of an (Dr. Vincent C. Barry, Michael L. Conalty, H. J. Rylance and F. R. Smith), 119
Extraction of Collagen from Tissues (Shirley M. Fitch, Mrs. Margaret L. R. Harkness and Dr. R. D. Harkness), 163
Extracts of *Azotobacter vinelandii*: Respiratory Chain Phosphorylation in (Dr. A. Tissières and Prof. E. C. Slater), 736
Extracts of the Silkworm, *Bombyx mori* L.: Studies on Transaminase and Decarboxylase Catalysed by (B. Bheemeswar), 555
Extruded Carbon Rods: Anisotropy of Effective Gas Diffusion Coefficients in (P. L. Walker, jun., Frank Rusinko, jun., and Emile Raats), 1167
Eye: That Inward, *review* by Dr. Eric Ashby, 369
  The Mind and the (Dr. Agnes Arber), *review* by Dr. Eric Ashby, 369
  Skull Development in Chick Embryos after Ablation of One (A. d'A. Bellairs), 658
Eye Chamber (Anterior), of Young Cats: Long-term Transplants of Infantile Rat Pituitaries cultivated *in vitro* and Grafted into the (Dr. P. M. Martinovitch and D. V. Radivojevitch), 699
Eyes of Crustaceans: A Possible New Vitamin $A_1$ Isomer in the (Georg Lambertsen and Olaf R. Braekkan), 553
Eyles, Joan M.: James Parkinson (1755–1824), 580
  Georgius Agricola (1494–1555), 949
Eyring, Prof. H.: Physics of Wool, 714

F-CENTRES in Metaphosphate Glass (Sadhan Basu), 265
Factor produced in Senescent Leaves: Acceleration of Abscission by a (Daphne J. Osborne), 1161, erratum, 1200
Factors influencing the Motility of a Strain of *Pseudomonas viscosa* (Dr. N. W. Preston and Dr. J. C. Sherris), 1220
Factory (Automatic): Towards the (Political and Economic Planning, Broadsheet No. 380), 133
Fading of 150-kc./s. Waves: Distribution-in-Speed of (R. B. Banerji), 131
Fading (Long-Period), in Medium-Wave Radio Signals (M. Srirama Rao and Dr. B. Ramachandra Rao), 459
Fahrenfort, J.: Advances in Molecular Spectroscopy, 680
Fairthorne, R. A.: Information Theory, 774
Faith in the World of Science: Christian, *review* by Dr. Charles E. Raven, 410

Falconer, Miss C. J. : Awarded a postgraduate scholarship in husbandry by the Department of Agriculture for Scotland, 677
Falkland Islands Dependencies Scientific Bureau : Sir Raymond Priestley temporarily appointed director of the, 910
Family : Atoms in the—My Life with Enrico Fermi, Designer of the First Atomic Pile (Laura Fermi), *review* by Prof. O. R. Frisch, 850
Family of Early Primates : A New, 500
F A O : The Story of (Gove Hambidge), *review by Sir John Russell*, 941
Faraday, Michael—Man of Simplicity (Prof. James Kendall), *review*, 850
Faraday Society : Discussion on Microwave and Radio-frequency Spectroscopy, 18
    Discussion on the Physical Chemistry of Enzymes, 958
Farm Animals : Fertility in (British Association for the Advancement of Science, Section M (Agriculture), Discussion on), 620
Farmers Union, National, and others : First National Crop Protection Conference (Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture), 1203
Farming : The Impact of Education on (W. B. Mercer), 446
Farooqi, Afzal, and others : Anomalies in the Cosmic-Ray Shower Curves for Lead, 876
Farquharson, Dr. R. : Information Theory, 773
Farquharson, Comdr. W. I. : Descriptions of Tidal Bores, Seiches, Surges and Secular Changes of Sea-level, 1057
Fast-Running Skis : Some Recent Experiments in Friction—Friction on Snow and Ice and the Development of some (Dr. F. P. Bowden), 946
Fat (Lamb Caul) : Isolation of $\Delta^9$ Heptadecenoic Acid from (Dr F. B. Shorland and A. S. Jessop), 737
Fat (Ox Perinephric) : Occurrence of *n*-Nonadecanoic Acid in (R P. Hansen, Dr. F. B. Shorland and N. June Cooke), 882
Fat (Peritoneal) : Growth of Sarcoma 37 Mouse Ascites Tumour in (Dr. Peter Warner), 1030
Fat Accumulation by Algae (D. M Collyer and G. E. Fogg), 586
Fat Metabolism : Cholesterol and, in relation to Diet and Disease (Scottish Branch of the Nutrition Society and the Biochemical Society Symposium on), 288, 774
Fat Production by Inositol-deficient Yeast (Dr. S. W. Challinor and N. W. R. Daniels), 1267
Fatigue of Metals : Investigation of the, by X-Ray Scattering (Dr. A. Franks and Dr. J. Holden), 1022
Fatterpaker, Dr. Prema, and others : Protective Action of Vitamin $B_{12}$ in the Hyperthyroid Rat, 165
Fatty Acids : Structure of Sterculic Acid and other Analogous (G. Dijkstra and H. J. Duin), 71
Fatty Acids in Phospholipids : Volatile (J. C. Hawke), 882
Fautrez, Prof. J., and others : Deoxyribonucleic Acid Content of the Nucleus and Nuclear Volume, 311
Faverge, J. M. : Evaluation of Methods in Applied Psychology and the Problem of Criteria, 449
Fawcett, C. H., and others : Alpha-Oxidation of Omega-(2 : 4-Dichlorophenoxy)alkanenitriles and 3-Indolylacetonitrile within Plant Tissues, 1026
Feather Keratin (Soluble) : The Free Amino-Groups of (A M. Woodin), 1117
Feathers (Bird-) : Cortex and Medulla of (Dr. L. Auber), 1218
Federation of British Industries (Industrial Research Committee) : Fourth Conference of Industrial Research Directors and Managers (The Education and Training of Graduate Staff for Industrial Research), 141
Federation of British Industries (North Midland Regional Council), and the Regional Advisory Council for the Organization of Further Education in the East Midlands : Report of the Conference on Industry and *Technical Education*, 821
Feed Resources of the Union of South Africa : A Survey of the Food and (G. Van de Wall and E. D. Alvord, Jnr.), *review* by Sir John Russell, 90
Feeding Cage : A Combined Aspirator and, for the Collection and Testing of Insects as Vectors of Plant Viruses (J. T Legg), 609
Feinmann, L., and others : Single-Breath Continuous Carbon Dioxide Analysis, 739
Felix, Dr. M. D., and others : The Contractile Vacuole of Parazoa and *Protozoa, and the Golgi Apparatus*, 301
Fellgett, Dr. P B. : Astronomical Seeing, 864
Fellowship of Reconciliation : Alex Wood Memorial Lecture (Prof. C. F. Carter), 239
Fellowships : I.C.I. (University of Cambridge Awards), 381
    Medical Research (National Research Council of Canada Awards), 102
    Mond Nickel (Awards for 1955), 770
    Ramsay Memorial (Awards for 1955–56), 336
Fellowships in Earth Sciences : Vannevar Bush (Massachusetts Institute of *Technology and the Carnegie Institution of Washington*), 1102
Fellowships for Postgraduate Research (British Oxygen Co., Ltd., Awards), 539
Fellowships for Research in Nutrition : Drummond (University College, London), 1249
Fellowships for Study and Travel in the United States (Commonwealth Fund), 725
Females of the Black-fly, *Simulium ornatum* Mg. : Behaviour of Young and Old (L. Davies), 979
Fenner, Prof. Frank, and Marshall, I D. : Occurrence of Attenuated Strains of Myxoma Virus in Europe, 782
Fennoscandian Pegmatites : Potassium–Argon Ages of some Lewisian and (Prof. Arthur Holmes, Dr. H. A. Shillibeer and Prof. J. T. Wilson), 390
*Fermi, Laura* : Atoms in the *Family—My Life with Enrico Fermi, Designer* of the First Atomic Pile, *review* by Prof. O. R Frisch, 850
Fern Apex : Responses of a, to Direct Chemical Treatments (Prof. C. W. Wardlaw), 1098
Ferraro, Prof. V. C. A : Magneto-Hydrodynamics, 234
    Electromagnetic Theory, *review* by E. Wild, 1237
Ferrihaemoglobin and Ferrimyoglobin Derivatives : Paramagnetic Resonance Absorption of (J. E. Bennett, Dr. D. J. E. Ingram, Dr. P. George and J. Stanley Griffith), 394
*Ferrimyoglobin Derivatives : Paramagnetic Resonance Absorption of* Ferrihaemoglobin and (J. E. Bennett, Dr. D. J. E. Ingram, Dr. P. George and J. Stanley Griffith), 394
Ferroverdin, a Green Pigment containing Iron produced by a Streptomycete (Prof E. B. Chain, Dr. A. Tonolo and Dr. A. Carilli), 645
Fertigungstechnisches Messwesen (Arbeitsgemeinschaft fur), and the Institut für Härteprüftechnik : International Conference on Hardness Measurement in the Works, 194
Fertility : Control of, by Antimitotic Agents (Dr. B. P. Wiesner and Prof. John Yudkin), 249
*Fertility in Escherichia coli* : Cell Surface and (Dr. G. A. Maccacaro), 125
Fertility in Farm Animals (British Association for the Advancement of Science, Section M (Agriculture), Discussion on), 620
Fertility, Society for the Study of : Annual Conference, 340
Fertility Association, International : Second World Congress on Fertility and Sterility, 817
Fertility and Sterility : Second World Congress on (International Fertility Association), 817
Fessard, Alfred, et autres (rédacteurs) : L'Année psychologique, cinquante-quatrième année, 1954, *review by* Prof. John Cohen, 230
Fessler, J. H. (Jackson, D. S., and) : Isolation and Properties of a Collagen Soluble in Salt Solution at Neutral pH, 69
Fever (Neurotropic Rift Valley) : A Brain Factor influencing the Viability of (Dr. A. Polson and T. L. Madsen), 645
Fevers (Arthropod-borne), of North Queensland : Relationships between the Flying Fox (Genus *Pteropus*) and (J L. O'Connor, L. C. Rowan and J. J. Lawrence), 472
Fibre Microscopy (Industrial Section of the Royal Microscopical Society *Symposium and Exhibition*), 493, 910
Fibrehyle : Use of (B. H. Newman), 57
Fibres (Textile and other Industrial) : The Electron Microscopy of (Electron Microscopy Group of the Institute of Physics Conference on), 632
Fibrils (Collagen) : Apparent Transformation of, into 'Elastin' (Prof. D. Burton, Dr. D. A. Hall, Dr M. K Keech, Dr. R. Reed, Miss H Saxl, Prof. R. E. Tunbridge and Miss M. J Wood), 966
Fibrous Proteins : Side-Chain Orientation in (Dr. R. D. B. Fraser), 358
Ficq A. (Errera, M., and) : Progress in Radiobiology, 683
Fiddler Crabs : *Displacement Activities* in (Helen R. S. Gordon), 356
Field Breakdown in Hydrogen : Mechanism of Uniform (A. Wilkes, W. Hopwood and N. J. Peacock), 837
Field Conditions : Evaporation of Water from Soil under (G. Stanhill), 62
Field Studies, Council for the Promotion of : Summer Courses, 15
Field Studies, Council for the Promotion of (Royal Meteorological Society and the) : Vacation Courses in Synoptic Meteorology, 1248
Field Tests on Wood Preservatives used for Pressure Treatment (D. N. Smith), (Forest Products Research, Bulletin No. 32), 248
*Field-Richards, Sara*, and White, M. Moore : Human Fertility, 341
Figurovsky, N A. (edited by) : D. I Mendeleieff—New Materials relating to the History of the Discovery of the Periodic Law [Russian text], 965
Film : Psychology and the (British Universities Film Council Conference on), 1109
Film Archives : Scientific (Dr. A R. Michaelis), 1194
Film Unit at the London Zoo : Television and, 863
Films (Thin) : Electric and Magnetic Properties of, *review* by Prof. L. F. Bates, 416
Filter for Trapping Airborne Micro-organisms : A Water-soluble (Merfyn Richards), 559
Filterability of the Swarmers of *Rhizobium* and *Azotobacter* (J. C. Lawrence), 1033
Filtrable Forms of *Salmonella enteritidis* in Media containing Blood Plasma (Fibrin Structure) : Regeneration of the (I. Juhász and J. Vadász), 208
Fine Structure of Cellulose and other Microfibrillar Substances (V. Balashov and Prof. R. D. Preston), 64
Finger : Effect of Anti-histamine Substances on Cold Vasodilatation in the (G. C. Whittow), 511
Finishing To-day : Bleaching, Dyeing and (Society of Dyers and Colourists Symposium on), 149
Finkle, B. J., and others : Physical Chemistry of Enzymes, 959
Finlay, Dr. J. M. : Awarded a Senior Medical Research Fellowship by the National Research Council of Canada, 102
Finlayson, L. H., and Lowenstein, Prof. Otto : A Proprioceptor in the Body Musculature of Lepidoptera, 1031
Finney, Dr. D. J. : International Biometric Symposium in Brazil, 1058
Finney, Dr D. J., and Outhwaite, Anne D. : Serially Balanced Sequences, 748
Finnish Institute for Occupational Health : Annual Report for 1954, 431
Finniston, Dr. H M. : Radiation Damage in Metals, 1147
Firket, H., and others : Action of Ribonuclease on Living Cells *in vitro* and Synthesis of Deoxyribonucleic Acid, 1075
Firket, J., and others : Progress in Radiobiology, 684
First Ascent of Mont Blanc (Sir Gavin de Beer and Max H. Hey), 100
Firth, Prof. Raymond : *Obituary* of the Hon. Camilla Wedgwood, 144
Fish : Role of Pantothenic Acid in the Reproductive Cycle of Ovaries in (Olaf R. Braekkan), 598
Fish (Indian Freshwater) : High-potency Vitamin $A_1$ Oils from (S. Balasundaram, Dr. H. R. Cama, P. R Sundaresan and T. N. R. Varma), 554
Fish (Cat-), *Clarias mossambicus* Peters. : Reproduction in the (P. H. Greenwood), 516
Fish Embryos and Larvae (Pelagic) : Significance of the Subdermal Space in (J. E. Shelbourne), 743
Fish Flour : Bread Rolls made with, 101
Fisher, James : Birds as Animals, I, A History of Birds, *review* by Sir Norman Kinnear, 481
    Rock specimens collected on Rockall exhibited by Dr. P. A. Sabine at the Geological Society of London, 909
Fisher, Dr. L. R., and others : Marine Biological Research, 108
Fisher, M. W., and others : Identity of Cephalosporin N and Synnematin B, 551
Fisher, Sir Ronald : Awarded the Copley Medal for 1955 of the Royal Society, 907, 1093 ; work of, 1093
Fisher, Sir Ronald, and Pyle, V. C. : Double Reduction at the Rosy, or Pink, Locus in *Lythrum salicaria*, 1176
Fisheries Convention, International : Fourth Meeting of the Permanent Commission, 584
Fisheries (Inland), Training Centre at Java (United Nations Food and Agriculture Organization), 909

Fishes of the Western North Atlantic (Henry B. Bigelow and William C. Schroeder), Part 2, Sawfishes, Guitarfishes, Skates and Rays ; Chimaeroids, *review* by Dr. G. A. Steven, 139
Fishes (Two Indo-Pacific), *Dasyatis uarnak* and *Upeneus moluccensis*, in the Eastern Mediterranean (Dr. A. Ben-Tuvia), 1177
Fishwick, Dr. W. : Appointed to the chair of electrical engineering at the University College of Swansea, 430 ; work of, 430
Fitch, Shirley M., and others : Extraction of Collagen from Tissues, 163
Fitness of Microcythaemics—a Correction (Dr. M. Siniscalco), 84
Fitz-James, Dr. P. C. : Awarded a Senior Medical Research Fellowship by the National Research Council of Canada, 102
FitzGerald, D. : Coal Science, 104
Fitzgerald, M. E. H. : Biological and Microbiological Methods of Estimating Vitamin $B_{12}$, 384
Fixation of Iodine in Selenium (R. A. Hyman and Dr. D. H. Tomlin), 977
Flame (Decomposition), of Methyl Nitrite (Dr. Peter Gray, A. R. Hall and H. G. Wolfhard), 695
Flames and Combustion (British Association for the Advancement of Science, Section A (Physics), Discussion on), 771
Flamme : L'Analyse spectrale quantitative par la (Dr. R. Mavrodineanu et H. Boiteux), *review* by J. R. Stansfield, 185
Flanagan, Prof. J. C. : Evaluation of Methods in Applied Psychology and the Problem of Criteria, 449
Flavin, Dr. Martin, and others : Metabolism of Propionic Acid in Animal Tissues, 823
Flavones (New), from *Pongamia pinnata* (L.) Merr.—Identification of Compound *D* (S. K. Pavanaram and Dr. L. Ramachandra Row), 1177
Fletcher, G. L., and Okada, S. : Protection of Deoxyribonuclease from Ionizing Radiation by Adsorbents, 882
Flexible Structures : Wind Effects on Bridges and other (National Physical Laboratory, Notes on Applied Science No. 11), 822
Flexural Rotational Slip as the Main Deformation Process in the Torsion of Zinc Crystals (A. D. Whapham and Dr. H. Wilman), 460
Flexure Devices : Bibliographical Survey of (P. J. Geary), 676
Flies : The Black (Diptera, Simuliidae), of Guatemala and their Role as Vectors of Onchocerciasis (Herbert R. Dalmat), *review* by Dr. John Smart, 1238
Flies (Tsetse) : Biology of, *review* by Dr. T. A. M. Nash, 755
  The Natural History of (Prof. Patrick A. Buxton), *review* by Dr. T. A. M. Nash, 755
  West African, 537
Flight (Space) : Influence of, on Engineering and Science (Milton W. Rosen), 1190
Flora of Egypt, Vol. 3, Angiospermae, part Monocotyledones, Liliaceae–Musaceae (Vivi Täckholm and Mohammed Drar), 101
Floras (Past) : Geographical Distribution of (W. N. Edwards), 441
Florisson, C., and Esche, R., and collaborators : Applications of Ultrasonics, 387
Florkin, Prof. M. : Elected an Honorary Fellow of the Royal Society of Edinburgh, 56
Florkin, Prof. M., et autres : Vertébrés—Embryologie, grands problèmes d'anatomie comparée, caractéristiques biochimiques (Traité de Zoologie, publié sous la direction de Pierre-P. Grassé, Tome 12), *review* by Prof. C. H. O'Donoghue, 756
Flour (Fish) : Bread Rolls made with, 101
Flow (Steady High-Speed) : Linearized Theory of (Prof. G. N. Ward), *review* by Prof. G. Temple, 369
Flow Birefringence : Variation of, with Stress (Dr. A. S. Lodge), 838
Flower Colour in the Dahlia : Chemistry and Inheritance of (Dr. E. C. Bate-Smith, Dr. T. Swain and Dr. C. G. Nordström), 1016
Flowering Behaviour of Rice : Effect of Auxins on the (Dr. S. M. Sircar and Maya Kundu), 840
Floyd, Dr. W. F. : Lighting and Vision, 718
Fluctuating Celestial Radio Source at 242 Megacycles per Second (Prof. J. D. Kraus, H. C. Ko and D. V. Stoutenburg), 304
Flugel, Prof. J. C. : *Obituary* by Sir Cyril Burt, 533
Fluid Dynamics of Jets (Prof. S. Pai), *review* by Prof. A. D. Young, 803
Fluids : Applications of Spectroscopy to Chemical Problems and on Intermolecular Forces and the Properties of (Summer School at the University of Cambridge), 1104
Fluorescence in Thionine : Slow Disappearance of, on addition of Abietic Acid (Prof. Santi R. Palit and Byomkesh Biswas), 214
Fluorine-19 Nucleus : Magnetic Moment of an Excited State of the (Dr. P. B. Treacy), 923
Fluorocarbon Derivatives : Formation of Complexes of Fluorocarbons and, with Polar Hydrocarbons, Polar Polymers, Proteins and Polypeptides (H. B. Klevens), 879
Fluorocarbons and Fluorocarbon Derivatives : Formation of Complexes of, with Polar Hydrocarbons, Polar Polymers, Proteins and Polypeptides (H. B. Klevens), 879
Fluorophosphate (Di-isopropyl) : Inhibition of Complement Activity by (Dr. Elmer L. Becker), 1073
Flurscheim, Dr. Bernard J. : *Obituary* by Prof. C. K. Ingold, 191
Fly (Black-) (*Simulium ornatum* Mg.) : Behaviour of Young and Old Females of the (L. Davies), 979
'Fly Ash' : Plant Growth on (Dr. W. J. Rees and G. H. Sidrak), 352 ; (R. Holliday, W. N. Townsend and D. Hodgson), 983
Flying Fox (Genus *Pteropus*) and Arthropod-borne Fevers of North Queensland : Relationships between the (J. L. O'Connor, L. C. Rowan and J. J. Lawrence), 472
Flying-Spot Microscope : Counting and Sizing of Particles with the (D. Causley and Prof. J. Z. Young), 453
Foetal and Juvenile Elephant Seals : Reproductive Organs of (W. Nigel Bonner), 982
Fogg, G. E. (Collyer, D. M., and) : Fat Accumulation by Algae, 586
Fogg, P. J. : Appointed assistant conservator of forests, British Honduras, 910
Foggie, A. : Appointed deputy chief conservator of forests, Gold Coast, 1248
Földi, M., and others : Effect of Isolated Cerebral Hypoxia and Hypercapnia on Sodium Excretion, 120
Foley, Frederic E. B. : Awarded a Francis Amory Prize by the American Academy of Arts and Sciences, 723
*Folia Scientifica Africae Centralis* (Institute for Scientific Research in Central Africa, Bukavu), Vol. 1, No. 1, 630
Folkes, Dr. B. F. : Metabolism of Nitrogen in Plants, 905
Fontaine, A. R. : Secretion of a Highly Sulphated Acid Mucopolysaccharide by the Brittle-star, *Ophiocomina nigra*, 606
Food : Energy Value of (Scottish Branch of the Nutrition Society Symposium on), 152
  Scientific and Technological Problems involved in using Ionizing Radiations for the Preservation of (Dr. R. S. Hannan), 731
Food Manufacturing Industries Research Association, British : Open Day, 196
Food Microbiology and Public Health (Society for Applied Microbiology Symposium on), 373
Food Production in South Africa, *review* by Sir John Russell, 90
Food and Agriculture Organization : The United Nations, *review* by Sir John Russell, 941
Food and Feed Resources of the Union of South Africa : A Survey of the (G. Van de Wall and E. D. Alvord, Jnr.), *review* by Sir John Russell, 90
Foods : Color in (Quartermaster Food and Container Institute of Chicago Report on), 491
Foot-and-Mouth Disease : Control of Yeast Contamination by 'Mycostatin' in Cultures of the Virus of (Jacqueline O. Wigmore and W. M. Henderson), 516
Foot-and-Mouth Disease and Vesicular Stomatitis in Kidney Monolayer Tissue Cultures : Growth and Titration of the Viruses of (R. F. Sellers), 547
Foot-and-Mouth Research Institute : Appointment of Stephen Cheveley as chairman of the Governing Body, 677
Forbes, B. G. : Awarded a senior studentship for 1955 by the Royal Commission for the Exhibition of 1851, 58
Ford, Prof. H. : Plasticity of Materials, 544
Ford, I. H., and Ollier, C. D. : Radioactivity of Zircons, 834
Ford, Roger A. : Photochemical Processes in Solids at Room Temperature, 1023
Ford, Dr. W. F. : Appointed lecturer in refractory materials at the University of Sheffield, 101
Ford Motor Co. : Annual Prize for the best contribution to the subject of the Peaceful Uses of Atomic Energy, 286
Foreign Ministers at Geneva : Message for the, 861
Foreign Scientific Material : Index of Translations of (Leslie Wilson), 1276
Foresight and Attitude on Mental Output : Effect of (Prof. E. Mira y Lopez), 449
Forest Products : Research on (Prof. E. P. Stebbing), 248
Forest Products Research Laboratory : Bulletin No. 32, Field Tests on Wood Preservatives used for Pressure Treatment (D. N. Smith), 248
  Bulletin No. 33, The Strength Properties of Plywood, Part 2, Effect of the Geometry of Construction (W. T. Curry), 248
Forestry in Malaya, 335
Forestry in Northern Ireland (Ministry of Agriculture in Northern Ireland Pamphlet on), 288
Forestry : The Literature of—an Appraisal, 1199
*Forestry Abstracts*, Vol. 16, No. 2, 1199
Forestry Commission : Bulletin No. 21, Tree Root Development on Upland Heaths (C. W. Yeatman), 675
Forests : Fungi in (British Association for the Advancement of Science, Sections K (Botany) and K* (Forestry), Discussion on), 671
Forests of the Upper Nile Province, 1862–1950 (G. A. Booth), 15
α-Formamidinoglutaric Acid : Enzymatic Conversion of, to Glutamic Acid by Rat Liver (Alfred G. Knudson, Jun.), 830
Form (A New), of Male Sterility in *Nicotiana tabacum* L. (J. G. Raeber and A. Bolton), 314
Formate-$^{14}C$ in Surviving Uterine Segments : *In vitro* Stimulation of Incorporation of, by Hydroxylated Œstradiols (Dr. Gerald C. Mueller), 127
Formation of Complexes of Fluorocarbons and Fluorocarbon Derivatives with Polar Hydrocarbons, Polar Polymers, Proteins and Polypeptides (H. B. Klevens), 979
Formation of Copper and Cobalt Complexes with the Epimeric Salicylidenementhylamines : Steric Effects in the (C. S. Hocking, Dr. W. G. P. Robertson and Dr. B. O. West), 832
Formation of Meteorites : Time Interval between Nucleogenesis and the (G. J. Wasserburg and R. J. Hayden), 130
Formation of Tubes by a Simple Rolling Action—a New Normal-Pressure Effect (M. J. Egan and A. Jobling), 689
Formation (Complex), between Montmorillonite and High Polymers (Dr. W. W. Emerson), 461
Formby, Flight-Lieut. J. : Awarded by the Air Ministry with the L. G. Groves Memorial Award for Meteorological Observers, 768
Forrester, Miss M. M. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 770
Forsyth, F. R. : Self-Inhibition in Germinating Rust Uredospores, 1103
Forsyth, W. G. G. : Appointed director of the Colonial Microbiological Institute, Trinidad, 195
Foskett, D. J. : The Function of Libraries, 1253
Fossil Carbonaceous Substances : Coals and Bitumens and related (Dr. S. I. Tomkeieff), *review* by Dr. J. Bronowski, 184
Fossils : Spitsbergen Tertiary Coal, 248
Foster, L. J. (Laycock, D. H., and) : Rainfall and Biennial Bearing in Tung (*Aleurites montana*), 654
Foster, R. : Visible Spectrum of Potassium Ethyl 1-Methoxypicrate and of related Compounds, 746
Foundations of Freedom—the New Universities Overseas (Sir James Duff), 675
Foundry Metallurgy at the Massachusetts Institute of Technology, 907
Four Possible Waves in Ionized Gas in a Magnetic Field (Dr. J. H. Piddington), 875
Fowden, Dr. L. : Azetidine-2-Carboxylic Acid, a New Constituent of Plants, 347
Fowl : Resistance to Lymphomatosis in the, in relation to Reproduction (Prof. F. B. Hutt and R. K. Cole), 1178
Fowl Sarcoma Cells (Rous) : Site of Virus-like Particles in (M. A. Epstein), 784, erratum, 862
Fowles, G. : Elementary Qualitative Analysis on the Small Scale, *review*, 481
Fox, M. : Chemical Effects of Ionizing Radiation, 197

Foxon, Dr. G. E. H.: Cinematography in Scientific Research, 726
  Title of professor of biology in the University of London conferred on, 957
Fractionation of the Deoxyribonucleic Acid of *T2r* Bacteriophage (Dr. Geoffrey L. Brown and Dr. Angela V. Martin), 971
Fragmentation of Science (Ritchie Calder), 447
Fraisse, Paul, et autres (rédacteurs): L'Année psychologique, cinquante-quatrième année, 1954, *review* by Prof. John Cohen, 230
Frankenburg, Dr. W. G.: Cigar Industry Annual Research Award made to, by the Cigar Manufacturers Association of America in conjunction with the Cigar Institute of America, 1200
Frankenburg, Dr. W. G., and others (edited by): Advances in Catalysis and related Subjects, Vol. 6, *review* by Dr. E. B. Maxted, 417
Franklin Institute, Philadelphia: An Elliott Cresson Medal awarded to Dr. F. P. Bowden, 16
  Edward Longstreth Medals awarded to C. Waller and Dr. R. Berriman, 539
Franks, Dr. A., and Holden, Dr. J.: Investigation of the Fatigue of Metals by X-Ray Scattering, 1022
Franks, F.: Partition Chromatography of Synthetic Detergents, 693
Fraser, D. C., and Jackson, K. F.: Effect of Heat Stress on Serial Reaction Time in Man, 976
Fraser, F. C., and Purves, P. E.: The 'Blow' of Whales, 1221
Fraser, Dr. K. B.: Apparent Reciprocal Exchange of Characters between the *Mel* and NWS Strains of Influenza A Virus in the Brain of One-day Old Mice, 212
Fraser, M. J., and others: Physical Chemistry of Enzymes, 958
Fraser, Dr. R. D. B.: Side-Chain Orientation in Fibrous Proteins, 358
  Histology of Wool, 714
Fraser, R. R., and Pattison, Dr. F. L. M.: Ethyl α-Fluoroacetoacetate, 696
Free Amino-Acids: Distribution of, in Embryos of *Xenopus laevis* (Dr. E. M. Deuchar), 258
Free Amino-Acids in Plant Materials: New (Dr. C. B. Coulson), 518
Free Amino-Groups of Soluble Feather Keratin (A. M. Woodin), 1117
Free Radical (Stable): Reduction of Riboflavin to a, using X-Rays (Dr. A. J. Swallow), 793
Free Radicals (Labile Photochemical): Detection of, by Paramagnetic Resonance (D. J. E. Ingram, W. G. Hodgson, C. A. Parker and W. T. Rees), 1227
Freed, Jerome J., and Green, Elizabeth Ufford: Deoxyribonucleic Acid Content of Nuclei in Tail Mesenchyme of *Rana pipiens* Tadpoles, 116
Freedland, V. D.: Library Resources for Industry and Commerce in the Manchester Area, 199
Freedom: Foundations of—the New Universities Overseas (Sir James Duff), 675
  Science and—The Proceedings of a Conference convened by the Congress for Cultural Freedom, Hamburg, 1953, *review* by R. B., 139
Freedom (Academic): Universities and, 567
Freeman, G. R.: Awarded an overseas scholarship for 1955 by the Royal Commission for the Exhibition of 1851, 58
Freezing Nuclei in the Atmosphere: Abnormal (Dr. B. M. Cwilong), 129
Freitag, E. H. (Bowden, Dr. F. P., and): Some Recent Experiments in Friction—Friction of Solids at High Speeds, 944
French, Dr. M. H., and Sykes, Dr. R. L.: The Effect of certain Drying Conditions on the Putrefaction of Cattle Hides and Goatskins, 297, 725
French, Lieut.-Colonel W.: *Obituary* by Major-General Cyril Lloyd, 814
French Bean: Quercetin Glucosiduronic Acid from the (C. A. Marsh), 176
French Society of Metallurgy: Annual 'Journées Métallurgiques d'Automne', 288
Frens, A. M.: Animal Production from Grass, 729
Frequency in Random Noise: Approximate Joint Probability Distribution for Wave Amplitude and (R. A. Wooding), 564
Frequency and Time Interval: An Atomic Standard of—A Caesium Resonator (Dr. L. Essen and J. V. L. Parry), 280; Definition of the Second of Time (Sir Edward Bullard), 282, erratum, 381
Freshly Formed Steel Surfaces: Reactivity of (A. Prince), 223; (Dr. U. R. Evans), 750
Fresh-water Biology in Scotland (Scottish Branch of the Institute of Biology Conference on), 677
Freshwater Fish (Indian): High-potency Vitamin A, Oils from (S. Balasundaram, Dr. H. R. Cama, P. R. Sundaresan and T. N. R. Varma), 554
Freshwater Microscopy (W. J. Garnett), *review* by Dr. John R. Baker, 992
Fretter, Dr. Vera: Marine Biological Research, 109
Fretter, Prof. William B.: Introduction to Experimental Physics, *review* by Prof. H. W. B. Skinner, 942
Freudenberg, Prof. K.: Chemistry of Naturally Occurring Pyrones, 638
Frey, Dr. D. (Durie, E. B., and): Isolation of *Microsporum gypseum* and of *Keratinomyces ajelloi* from Australian Soil, 936
Frey-Wyssling, Prof. A.: Problems of International Concern in the Biological Sciences, 242
Friction: Some Recent Experiments in—Friction of Solids at High Speeds (Dr. F. P. Bowden and E. H. Freitag), 944; Friction on Snow and Ice and the Development of some Fast-Running Skis (Dr. F. P. Bowden), 946
Friction on Snow and Ice and the Development of some Fast-Running Skis: Some Recent Experiments in Friction—(Dr. F. P. Bowden), 946
Friction of Solids at High Speeds: Some Recent Experiments in Friction—(Dr. F. P. Bowden and E. H. Freitag), 944
Frisby, Dr. C. B.: Applied Psychology, 449
Frisch, Prof. O. R.: Atoms in the Family, *review*, 850
Frog's Heart: Effect of Vagal Stimulation on the Sinus Venosus of the (Dr. O. F. Hutter and Dr. W. Trautwein), 512
Fröhlich, Prof. H.: Theory of the Solid State, *review*, 479
Fromageot, Prof. C.: Advances in Organic Chemistry, 760
Fronds (*Lemna*): Nitrogen Nutrition, Respiration and Ageing in (E. Wangermann and H. J. Lacey), 500
Fruit (Baobab): Ascorbic Acid Content of (W. R. Carr), 1273
Fruit Production, *review* by Dr. John Grainger, 322
Fruit Year Book, 1955 (edited by P. M. Synge and Lanning Roper), *review* by Dr. John Grainger, 322
Fruit and Cider Institute, National: Fifty-second Annual General Meeting, 290
Fry, Dr. D.: Psychology and the Film, 1110
Fry, R. M., and Bossard, Joan: Food Microbiology and Public Health, 373
Fryer, G., and Iles, T. D.: Predation Pressure and Evolution in Lake Nyasa, 470
Fuchs, O. (Kollonitsch, J., and): Preparation of Aluminium Borohydride and its Applications in Organic Reductions, 1081
Fuchs, Prof. W.: Coal Science, 103
Fucks, Prof. W.: Information Theory, 774
Fujii, T., and others: Reaction of Starfish Spermatozoa to Histidine and certain other Substances considered in relation to Zinc, 1068
Fuller's Earth: Spot Chromatography of Hydraulic Mineral Oils using (J. E. C. Stringer), 81
Fullerton, Prof. H. W.: Cholesterol and Fat Metabolism in relation to Diet and Disease, 775
Fults, Jess L., and others: Effect of 2,4-Dichlorophenoxyacetic Acid and Maleic Hydrazide on Potato Proteins as shown by Paper Electrophoresis, 1029
Function of the Bower of Bower-birds (Ellis McNamara), 207
Function of Carotenoids in Photosynthesis (Dr. Mary Griffiths, Dr. W. R. Sistrom, Dr. Germaine Cohen-Bazire and Prof. R. Y. Stanier), 1211; (Prof. M. Calvin), 1215
Function of Heparin (J. F. Riley, Dr. D. M. Shepherd, Dr. G. B. West and S. W. Stroud), 1123
Function of Krause's Membrane (A. F. Huxley and Dr. R. E. Taylor), 1068
Function of Libraries (Library Association Discussion on), 1252
Functions: Entire (Ralph Philip Boas, Jr.), *review* by Dr. L. S. Goddard, 185
  Higher Transcendental (based, in part, on Notes left by the late Prof. Harry Bateman, and compiled by the staff of the Bateman Manuscript Project), Vol. 3 (edited by A. Erdélyi), *review* by Prof. T. M. MacRobert, 1138
  Tables of, and of Zeros of Functions (United States National Bureau of Standards, Applied Mathematics Series, No. 37), *review* by J. H. Pearce, 848
Fundamentals of the Chemistry of Canning Processes (Symposium at the Fourth Conference of the International Union of Leather Chemists' Societies), 587
Fundamentals of Physical Metallurgy, *review* by Dr. J. A. Catterall, 229
Fundamentals of Radiobiology (Prof. Z. M. Bacq and Dr. P. Alexander), *review* by Dr. J. F. Loutit, 230
Fungi in Forests (British Association for the Advancement of Science, Sections K (Botany) and K* (Forestry), Discussion on), 671
Fungi (Asexual): Speciation and Variation in (edited by R. W. Miner), 240
Further Education in the East Midlands, Regional Advisory Council for the Organization of, and the North Midland Regional Council of the Federation of British Industries: Report of the Conference on Industry and Technical Education, 821
Fusari, S. A., and others: Identity of Cephalosporin *N* and Synnematin *B*, 551
Fusaric Acid a Vivotoxin?: Is (K. Lakshminarayanan and D. Subramanian), 697
Fuson, N.: Advances in Molecular Spectroscopy, 682
Fussell, G. E.: History of Cole (*Brassica* sp.), 48
Future: The Impact of Science on Management in the (British Institute of Management Conference on), 677, 1108
Future Trends in World Economic Development: Past and (Sir George Nelson), 1207
Fyfe, V. C. (Fisher, Sir Ronald, and): Double Reduction at the Rosy, or Pink, Locus in *Lythrum salicaria*, 1176

GABOR, Dr. D.: Information Theory, 773
Gabor, Dr. D., and others: Langmuir's Paradox, 916
Gaddum, Prof. J. H.: United States Pharmacopeia, *review*, 1186
Gaillard, M. Q., and others: Anti-tumorigenic Action of Iodinated Compounds, 466
Gaillard, Prof. P. J.: Elected president of the Society for Cell Biology, 105
Galactic Research: Co-ordination of (edited by A. Blaauw), *review* by Prof. R. O. Redman, 847
Gallaher, Ltd.: Grant of £300 a year under covenant to Queen's University, Belfast, to support work in the Department of Chemistry, 57
Galston, Dr. A. W.: Plant Growth Substances, 531
Galton, Dr. David: Appointed secretary of the (European) Scientific Advisory Committee of the Lady Tata Memorial Trust, 725
Galton, D. A. G., and others: Progress in Radiobiology, 683
Gambling, W. A., and others: High-Pressure Glow-to-Arc Transitions with Tungsten and Copper Cathodes, 28
Gamma-Ray Beam: A Direct Measurement of the Energy Locally Absorbed from a (Prof. H. E. Jones, J. P. Bernier and D. V. Cormack), 560
Gamma-Ray Spectroscopy: Beta- and (edited by Prof. Kai Siegbahn), *review* by Prof. M. H. L. Pryce, 414
Gamma-Rays: Circular Polarization of, following Polarized Neutron Capture (Dr. Georg Trumpy), 507
  Effects of, on Solutions of Sodium Deoxyribonucleate—Possible Chemical Mechanism for their Biological Effects (R. A. Cox, Dr. W. G. Overend, Dr. A. R. Peacocke and S. Wilson), 919
Garamba: Scientific Exploration of the Belgian African National Park of the (Dr. Tracy Philipps), 1011
Garcia-Moliner, Dr.: Awarded a Ramsay Memorial Fellowship for 1955–56, 336
Garden Pea: Physiological Genetics of the (D. M. Paton and H. N. Barber), 1103
Gardner, G. W. H.: Appointed director of the Royal Aircraft Establishment, Farnborough, 241
Gardner, K. J.: Use of Acid-Base Indicator for Quantitative Paper Chromatography of Sugars, 929
Gardner, Dr. R. G., and Mitchell, T. J.: Algal Chemistry, 1107
Garlick, Dr. G. F. J.: Appointed to the chair of physics in the University of Hull, 1197; work of, 1197
Garnett, W. J.: Freshwater Microscopy, *review* by Dr. John R. Baker, 992
Garnham, J. E.: Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Garrod, D. J.: Appointed scientific officer, East African Fisheries Research Organization, East Africa High Commission, 1249
Garry, Prof. R. C.: Energy Value of Food, 152
  Appointed a member of the Medical Research Council, 725

Garton, C. G (Stark, K. H., and): Electric Strength of Irradiated Polythene, 1225
Gas (Hydrogen): Modification of X-Ray Sensitivity of Bean Roots by (Dr. Michael Ebert and Dr Alma Howard), 828
Gas (Ionized): Hydromagnetic Waves in (Dr. J H Piddington), 568
Gas (Ionized), in a Magnetic Field: The Four Possible Waves in (Dr. J. H. Piddington), 875
Gas Council: London Research Station of the—Opening of New Laboratories, 1154
Gas Diffusion Coefficients: Anisotropy of Effective, in Extruded Carbon Rods (P. L Walker, jun., Frank Rusinko, Jun., and Emile Raats), 1167
Gas Dynamics and Combustion: Physical Measurements in (edited by R. W. Ladenburg, B. Lewis, R. N. Pease and H S. Taylor), *review* by Dr. A G. Gaydon, 1040
Gas Refrigerating Machines: Principles of (Dr. J. W. L. Kohler), 623
Gas Turbine: The Development of the (Sir Harold Roxbee Cox), 1104
Gaseous Phase: A Correlation between the Rates of Unimolecular Pyrolysis of Alkyl Halides in the, and $S_N1$ Rates in Solution (Dr. Allan Maccoll and Dr P. J. Thomas), 392
Gass, I. G.: Appointed geologist, Cyprus, 16
Gaster (Leon) Memorial Premium of the Illuminating Engineering Society awarded to Dr. W. E Harper and A. G. Palmer, 724
Gatenby, Prof. J. Brontë, and others: The Contractile Vacuole of Parazoa and Protozoa, and the Golgi Apparatus, 301
Gates, J. W.: Reverse-Shearing Interferometry, 359
Gatfield, E. N. (Jones, Dr. R., and): Testing Concrete by an Ultrasonic Pulse Technique, 538
Gaumann, Prof. E.: Elected a foreign associate of the Paris Academy of Sciences, 1200
Gaunt, Dr. J, and Littler, D J.: Peaceful Uses of Atomic Energy—Reactor Physics and Chemistry, 619
Gaunt, Prof. J. G.: Awarded the Duddell Medal for 1956 of the Physical Society, 241
Gaussen, Prof H.: Elected *correspondant* for the Section of Rural Economy of the Paris Academy of Sciences, 102
Gavin, Dr. M R.: Appointed to the chair of applied electricity in the University College of North Wales, 334; work of, 334
Gavreau, V.: Applications of Ultrasonics, 387
Gavrilesco, Mme. K, and others: A Study of Normal Human Cerebrospinal Fluid by the Immuno-Electrophoretic Method, 976
Gawn, Dr R W. L.: Cavitation in Hydrodynamics, 808
Gaydon, Dr. A. G.: Flames and Combustion, 771
  Physical Measurement in Gas Dynamics and Combustion, *review*, 1040
Geary, P. J: Bibliographical Survey of Flexure Devices, 676
Gedda, Luigi (a cura di): Genetica Medica—Ium Symposium Internationale Geneticae Medicae, *review*, 139
Geiger Region: Counting Tritiated Water at High Humidities in the (Edward B. Butler), 1262
Geissman, Prof. T A.: Chemistry of Naturally Occurring Pyrones, 638
Gelatine and Glue Research Association, British: Research Panel Meeting (A. G. Ward), 105
Gelatins (Degraded): Mechanical Properties of (P. R. Saunders and A. G. Ward), 26
Geleji, Academician Sándor: Awarded a second-class Kossuth Prize for Research, 14
Geller, Dr. Z., and Low, Dr. W.: Amplification of 1-cm. Waves in the Helium Negative Glow, 1021
Gelles, Dr. E.: Magnetic Catalysis of the Decarboxylation of Oxaloacetic Acid, 925
Gelles, Dr E., and Reed, Dr. R I.: Carbon-13 Isotope Effects in the Decarboxylation of some Oxaloacetates, 1262
Gels (Calcium Sulphate): Nature of, in Ethylene Glycol (J. Cano Ruiz and Dr. Douglas C M. MacEwan), 1169
Gene: Is the, a Prime Mover? (Prof. Carl C. Lindegren), 1244
Gene Control of Copper-Sensitivity in *Saccharomyces* (Arturo Brenes-Pomales, Gertrude Lindegren and Prof. Carl C Lindegren), 841
General Electric Co., Ltd, and others: Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
Generalization of the Concept of Acid-Strength and Acidity (M. Mandel), 792
Genetic Control of some Serum Proteins in Normal Humans (Dr. O. Smithies and Dr. Norma Ford Walker), 1265
Genetic Control of Sodium and Potassium Concentrations in the Red Blood Cells of Sheep (J. V. Evans and J W B King), 171
Genetic Recombination in *Streptomyces* (Dr. G. Sermonti and I. Spada-Sermonti), 121
Genetic Research (Meeting at the Atomic Energy Research Establishment to consider programmes of), 448
Genetic Studies of Yeasts: New Materials and Procedures for (Dr. Lynferd J. Wickerham), 22
Genetica Medica—Ium Symposium Internationale Geneticae Medicae, 1953 (a cura di Luigi Gedda), *review*, 139
Genetical Effects of Radiation from Products of Nuclear Explosions (Prof. J. B. S. Haldane), 115, (Sir John Cockcroft), 115
Genetics at Glasgow, 1101
Genetics: Lethal Factors in, *review* by Dr. C. Auerbach, 990
  Relation of, to Population Studies, 532
  Research in (Grant of 30,000 dollars from the Rockefeller Foundation to the Galton Laboratory of University College, London, for), 379
Genetics of Endosperm (Dr A Rutishauser), 210
Genetics of the Garden Pea: Physiological (D. M. Paton and H N Barber), 1103
Genetics of *Paramecium aurelia* (Dr. G. H. Beale), *review* by Prof. J. F. Danielli, 136
Genetics and Medicine (British Association for the Advancement of Science, Sections D (Zoology), I (Physiology) and J (Psychology), Discussion on), 532
Genetics and Plant Breeding (British Association for the Advancement of Science, Sections K (Botany) and M (Agriculture), Symposium on), 719
Geneva: Message for the Foreign Ministers at, 861
Genius: The Personality of a, *review* by Prof. C. H. Waddington, 989
Genphysiologie der Entwicklung: Letalfaktoren in ihrer Bedeutung fur Erbpathologie und (Prof. Ernst Hadorn), *review* by Dr. C Auerbach, 990
Genus (A New), of the Actinomycetales: *Chainia*, (Dr M. J. Thirumalachar), 934
Genus *Streptomyces*: Spore Formation in the (T. R. Vernon), 935
Genzel, L.: Advances in Molecular Spectroscopy, 681
Geographical Association: Annual Conference, 1104
Geographical Distribution of Past Floras (W N. Edwards), 441
Geographical Society, Royal, and the Alpine Club: Mount Everest Foundation, 239
Geography: Earthquake, *review* by Ernest Tillotson, 617
Geography and its History (J N L Baker), 442
Geological Investigations in South Australia: Archæological and, 492
Geological, Dynamical and Palæomagnetic Aspects of Polar Wandering (Department of Geodesy and Geophysics of the University of Cambridge Colloquium on), 422
Geology at the Imperial College, London, 490
Geology at St. Andrews, 954
Geology: Isotope (Prof Kalervo Rankama), *review* by Prof. Arthur Holmes, 1038
  Isotopes in the Service of, *review* by Prof. Arthur Holmes, 1038
Geology in Engineering (Dr. John R Schultz and Dr. Arthur B. Cleaves), *review* by Dr F J North, 1091
Geology of the Ice Age, *review* by D F. W. Baden-Powell, 572
Geology of Petroleum (A. L Levorsen), *review* by H. B. Milner, 185
Geology of Rockall, 909
Geology (African): Research Institute of (Gift of £100,000 from the Anglo-American Corporation of South Africa, Ltd., to the University of Leeds, for the foundation of a), 1152
Geology and Civil Engineering: Soil Mechanics, (British Association for the Advancement of Science, Sections C (Geology), and G (Engineering), Symposium on), 715
Geophysical Research in North America, *review* by B C. Browne, 943
Geophysics: Advances in (edited by H. E. Landsberg), Vol. 2, *review* by B. C. Browne, 943
Geophysicists (Exploration), European Association of: Ninth Meeting, 957
Georg, A. (edited by, with the assistance of Georg-Plant, M.): Elsevier's Encyclopaedia of Organic Chemistry, Vol. 14, Supplement, Nor-Steroids, Steroids—Hydrocarbons, Halogen, Nitrogen and Unsubstituted Monohydroxyl Compounds, *review* by Dr. J. W. Cook, 523
Georg-Plant, M. (edited by Georg, A., with the assistance of): Elsevier's Encyclopaedia of Organic Chemistry, Vol. 14, Supplement, Nor-Steroids, Steroids—Hydrocarbons, Halogen, Nitrogen and Unsubstituted Monohydroxyl Compounds, *review* by Dr. J. W Cook, 523
George, Dr. F. H.: Semantics, 674
George, Dr. P., and Hanania, G I H.: Physical Chemistry of Enzymes, 960
George, Dr. P., and others: Paramagnetic Resonance Absorption of Ferrihæmoglobin and Ferrimyoglobin Derivatives, 394
Gérard, P., et autres: Vertébrés—Embryologie, grands problèmes d'anatomie comparée, caractéristiques biochimiques (Traité de Zoologie, publié sous la direction de Pierre-P. Grassé, Tome 12), *review* by Prof. C. H. O'Donoghue, 756
German Forschungsgesellschaft Kunststoffe e.V: Foundation of the Deutsche Kunststoff-Institut in Darmstadt, 288
German Plastics Industry, 288
Germanium in some of the Waste-Products from Coal (K. V. Aubrey), 128
Germany: Preservation of the Sheld-Duck in, 769
Germer, Dr L. H., and Boyle, Dr. W. S.: Anode and Cathode Arcs, 1019
Germinating Rust Uredospores: Self-Inhibition in (F. R Forsyth), 1103
Gerthsen, Dr. Christian (Bechert, Dr. Karl, und): Atomphysik, Band I, Allgemeine Grundlagen, Teil 1 und Teil 2, *review* by Dr. E. Bretscher, 526
Gerzon, K., and co-workers: Advances in Organic Chemistry, 760
Geschwind, Dr Irving I., and others: Amino-Acid Sequences of Alpha-Corticotropin, 687
Geurden, Prof. L. M. G.: Pathology of Birds in Zoological Gardens, 1255
Ghosh, Prof. B. N., and Ray, K. C.: Electrophoretic Measurement of the True Zeta-Potential of Arsenious Sulphide Sol in the Region of Slow Coagulation, 1080
Giacomini, Prof. A: Applications of Ultrasonics, 387
Gibbs, F. W.: *Obituary* of R B. Pilcher, 953
Gibson, Adrian, and others: Discovery at Swanscombe of a portion of a Human Skull Bone, 287
Gibson, Dr. F., and others: Effect of Antibiotics on Indole Synthesis by *Escherichua coli* 7–4, 164
Gibson, Q. H., and Roughton, F. J. W.: Physical Chemistry of Enzymes, 960
Gibson, T. G. E.: Appointed assistant director of agriculture and veterinary services, Somaliland Protectorate, 16
Gibson, W. M.: High-Energy Nuclear Physics, 372
Gierer, A (Sizer, I. W., and): Physical Chemistry of Enzymes, 959
Gifford, Cameron: Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Gilchrist, J. M.: Appointed a lecturer in mechanical engineering at Queen's University, Belfast, 1104
Gillespie, J. M. (Lennox, Dr. F. G., and): Chemistry of Wool, 713
Gillet, A.: Coal Science, 103
Gillett, Dr J. D: Behaviour Differences in Two Strains of *Aedes aegypti*, 124
Gillieson, A. H, and Thorne, R. P.: Discrepancy between the Spectro-Isotopic and the Mass-Spectrometric Results for the Natural Abundance Ratio of the Lithium Isotopes, 1228
Gillman, Prof Theodore, and others: Influence of Cortisone on Connective Tissue—Epithelial Relations in Wound Healing, Hair Regeneration and the Pathogenesis of Experimental Skin Graft, 932
Ginsberg, D., and others: Enzymatic Coagulation of Semen, 1209
Girdwood, Dr. R. H.: Biological and Microbiological Methods of Estimating Vitamin $B_1$, 384
Giroud, Dr. C. J P.: Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Gisborne, J. H.: Appointed assistant director of agriculture (research), Northern Region, Nigeria, 195
Gittins, R. T: Appointed field officer (geology), Uganda, 910
Glacial Shore-lines (Dr. P. B. McFarlane), 213
Glascock, Dr. G. F.: Use of Radioactive Materials in Biological Assay, 427
Glasgow 340-MeV. Synchrotron (Dr. W. McFarlane, S. E. Barden and Dr. D L. Oldroyd), 666

Glass, B.: Problems of International Concern in the Biological Sciences, 242
Glass (Metaphosphate): *F*-Centres in (Sadhan Basu), 265
Glass-Sellers of London, Worshipful Company of: Scholarships in glass technology, tenable at the University of Sheffield, 770

Henglein, A. : Chemical Effects of Ionizing Radiation, 197
Hennessey, Dr. R. S. F. : Appointed director of the Wellcome Laboratories of Tropical Medicine, London, 288, 1054 ; work of, 1054
Henningsen, Dr. K., and Jacobsen, Dr. Tyge : Relationship between Blood Factors *P* and *Q*, 1179
Henrotte, J. G. : A Crystalline Component of Carp Myogen precipitating at High Ionic Strength, 1221
Henry, D. F. C. : Soil Mechanics, Geology and Civil Engineering, 716
Henry, M. N. : Appointed pathologist, grade B, Trinidad, 1249
Henry, Dr. N. F. M. : Appointed editor of *Mineralogical Abstracts*, 1005
Heparin (Società Lombarda di Scienze Mediche e Biologiche Symposium on), 1005
  Function of (J. F. Riley, Dr. D. M. Shepherd, Dr. G. B. West and S. W. Stroud), 1123
Hepatectomized Dogs : Release of Histamine in, during Anaphylactic, Peptone and Tryptic Shock (H. Moussatché), 648
Heppleston, Dr. A. G. (Gough, Prof. J., and) : Dust and Health in Industry, 762
$\Delta^9$ Heptadecenoic Acid : Isolation of, from Lamb Caul Fat (Dr. F. B. Shorland and A. S. Jessop), 737
Hepton, C. E. L., and others : Electron Microscopic Observations on the Structure of the Sieve Plates in *Cucurbita*, 868
Herbage : A Method for Sampling Arthropods and Molluscs from, by Suction (Dr. C. G. Johnson, Dr. T. R. E. Southwood and Mrs. H. Entwistle), 559
Herbert, T. M. : Science and British Railways, 20
Hercock, R. J. : Cinematography in Scientific Research, 726
Herington, Dr. E. F. G. : A New Class of Compounds containing the Pentacyanoferrate Group and an Unpaired Electron, 80
Herman, Dr. F. : Intermetallic Semiconductors, 341
Hermaness Nature Reserve, 684
Herpetichthyes, Amphibioidei, Choanichthyes or Sarcopterygii ? (Prof. Alfred Sherwood Romer), 126 ; (Dr. Ethelwynn Trewavas, Dr. E. I. White, N. B. Marshall and Denys W. Tucker), 126
Herrick, Clarence Luther : Life of (Prof. C. J. Herrick), 336
Herring Larvae : Reactions of, to Light—a Mechanism of Vertical Migration (P. M. J. Woodhead and A. D. Woodhead), 349
Hertz (Heinrich) Premium for 1954 of the British Institution of Radio Engineers awarded to Dr. T. B. Tomlinson, 536
Herzberg, Dr. G. : Theoretical Physics, 588
Hesse, Gerhard, and Weil, Herbert : Michael Tswett's First Paper on Chromatography, *review* by Dr. R. Consden, 526, 632
Hesse, Dr. Mary B. : Science and the Human Imagination, *review* by Prof. C. A. Coulson, 846
Hetényi, Academician Géza : Awarded a second-class Kossuth Prize for Research, 14
Heterogeneous Catalysis : Effect of Chelating Agents on (Alan Dobry), 266
Hetherington, Sir Hector : The British University System 1914–1954, 522, 567
Hewish, Dr. A. : Astronomical Seeing, 864
Hewitt, Dr. E. J. : Trace Elements and Plant Growth, 622
Hexacanth Embryos (Taeniid) : A Technique for Studying the *in vitro* Effect of Serum on Activated (Paul H. Silverman), 598
Hexacarboxylic Acid derived from $B_{12}$, and the Molecular Structure of the Vitamin : Structure of Vitamin $B_{12}$—The Crystal Structure of the (Dr. Dorothy Crowfoot Hodgkin, Jenny Pickworth, John H. Robertson, Prof. Kenneth N. Trueblood, Richard J. Prosen and John G. White), 325
Hexacarboxylic Acid Degradation Product : Structure of Vitamin $B_{12}$—The Structure of Vitamin $B_{12}$, and its (R. Bonnett, Dr. J. R. Cannon, Dr. A. W. Johnson, I. Sutherland, Sir Alexander Todd and Dr. E. Lester Smith), 328
*n*-Hexane : Radiolysis of Liquid *n*-Hexane and Solutions of Anthracene in (Dr. F. H. Krenz), 1113
*n*-Hexane (Liquid) : Radiolysis of, and Solutions of Anthracene in *n*-Hexane (Dr. F. H. Krenz), 1113
Hextall, Miss P. J. : Awarded an overseas scholarship for 1955 by the Royal Commission for the Exhibition of 1851, 58
Hexter, R. M. : Advances in Molecular Spectroscopy, 682
Hey, Dr. J. S. : Radio Techniques in Meteor Astronomy, *review*, 135
Hey, Dr. M. H. : Appointed editor of the *Mineralogical Magazine*, 1005
Hey, Dr. M. H. (de Beer, Sir Gavin, and) : First Ascent of Mont Blanc, 100
Heyndrickx, P. (Lacourt, A., and) : Direct Spectrophotometric Determination on Paper of Chromatographic Spots of Cobalt and Copper, 880
Heyrovsky, Prof. J. : Elected president of the Polarographic Society in Great Britain, 539
  To visit Great Britain, 725
  Hungarian–Czechoslovak Polarographic Conference, 865
  Presented with a diploma of honorary fellowship of the Hungarian Academy of Science, 865
  New Trends in Polarography, 865
  New Polarographic Laboratory of the Cambridge Instrument Co., Ltd., opened by, 1003
Heywood, Dr. H. : Energy from the Sun, *review*, 804
Hiatt, R. : Problems of International Concern in the Biological Sciences, 243
Hickman, Dr. C. J. : Given the title of reader in mycology in the Department of Botany in the University of Birmingham, 15
Hide, Dr. R. : Magneto-Hydrodynamics, 236
Hides (Cattle), and Goatskins : The Effect of certain Drying Conditions on the Putrefaction of (Dr. M. H. French and Dr. R. L. Sykes), 297, 725
Hieger, Dr. I. : One in Six, an Outline of the Cancer Problem, *review* by Prof. H. N. Green, 941
Hiemstra, S. A. : Age of Uraninites from Dimensions of their Unit Cells, 405
*Hieracium* : Distribution Maps of Scandinavian Species of (Prof. Gunnar Samuelsson), 240
Higgins, G. : Advances in Molecular Spectroscopy, 681
Higgins, William (Chemist), 1763–1825 (Prof. J. R. Partington), 8
Higgs, P. W. : Advances in Molecular Spectroscopy, 682
High Acuities of Taste for Phenylthiocarbamide : Some Notably (Prof. J. W. H. Lugg), 313
High Altitude Research (National Institute of Sciences of India Symposium, at the Gulmarg Research Observatory), 448
High-Altitude Rockets : Exploration of the Earth's Upper Atmosphere, using—British Research Programme (Sir David Brunt), 282
High Commission Territories : Economic Development and Social Services, 1158
High-Energy Nuclear Physics (Physical Society's Summer Meeting on), 371
High Humidities in the Geiger Region : Counting Tritiated Water at (Edward B. Butler), 1262
High Ionic Strength : A Crystalline Component of Carp Myogen precipitating at (J. G. Henrotte), 1221
High Polymers : Complex Formation between Montmorillonite and (Dr. W. W. Emerson), 461
High-potency Vitamin $A_2$ Oils from Indian Freshwater Fish (S. Balasundaram, Dr. H. R. Cama, P. R. Sundaresan and T. N. R. Varma), 554
High Potential Gradients : Paper Electrophoresis of Amino-Acids and Oligopeptides at Very (Dr. D. Gross), 72
High-Pressure Glow-to-Arc Transitions with Tungsten and Copper Cathodes (W. L. Price, W. A. Gambling and Dr. H. Edels), 28
High Pressures : A New Method for the Absolute Measurement of (R. S. Dadson), 188
High-Silica Sands : Adsorption of Methylene Blue by (G. Mitchell, P. Poole and H. D. Segrove), 1025
High Speed Aerodynamics : General Theory of (edited by W. R. Sears), *review* by Prof. G. Temple, 479
High-speed Electronic Tachistoscope : New (Prof. George Humphrey, P. G. M. Dawe and Bernard Mandell), 231
High-Speed Flow : Linearized Theory of Steady (Prof. G. N. Ward), *review* by Prof. G. Temple, 369
High-speed Skew-ray Tracing : Ultra (Dr. Gordon Black), 27
High Speeds : Some Recent Experiments in Friction—Friction of Solids at (Dr. F. P. Bowden and E. H. Freitag), 944
Higher Education in the Colonies, 1198
Higher Technological Education in Britain, 1085
Higher Technological Education in South-East England, 146
Higher Transcendental Functions (based, in part, on Notes left by the late Prof. Harry Bateman, and compiled by the staff of the Bateman Manuscript Project), Vol. 3 (edited by A. Erdélyi), *review* by Prof. T. M. MacRobert, 1138

Highway Engineering Education Trust: Two grants to the Department of Civil Engineering, University of Birmingham, one for establishing a lectureship in highway engineering, and one for the organization of a summer school in road construction, traffic engineering and highway soil mechanics, 1055

Huffman, Dr. D. A.: Information Theory, 774
Hug, O., and Wolf, L.: Progress in Radiobiology, 683
Huggins, P.: Awarded a Premium by the British Institution of Radio Engineers, 536

Hughes, D. L. : Appointed to the chair of veterinary pathology in the University of Liverpool, 448, 535 ; work of, 535
Hughes, J. G. : Awarded a senior studentship for 1955 by the Royal Commission for the Exhibition of 1851, 58
Hughes, R. Elfyn : Ecology of Snowdonia—Ecology of Livestock Productivity, 595
Hughes Medal for 1955 of the Royal Society awarded to Prof. H. S. W. Massey, 907, 1094
Hughes-Rice, J. : Appointed provincial agricultural officer, Kenya, 16
Hubbs, J. V. : Appointed mining geologist, Sierra Leone, 539
Huisman, Dr. H. O., and others : A New Acaricide, 2,4,5,4'-Tetrachlorodiphenylsulphone, 515
Hull, Dr. R. : Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Hulse, Dr. C. (Thring, Prof. M. W., and) : Flames and Combustion, 771
Human Affairs : Biology and, 1111
Human Biology for the Masses, *review* by T. H. Hawkins, 323
Human Cerebrospinal Fluid : A Study of Normal, by the Immuno-Electrophoretic Method (Mme. K. Gavrilesco, Mlle. J. Courcon, Mlle. P. Hillion, J. Uriel, J. Lewin and P. Grabar), 976
Human Cervix Uteri : Chromosome Number of (Dr. G. K. Manna), 354
Human Diseases in East Africa : Animal and (Conference in Kampala), 1153
Human Imagination : Science and the (Dr. Mary B. Hesse), *review* by Prof. C. A. Coulson, 846
Human Power : New Records in (Dr. P.-O. Åstrand), 922
Human Problems : Research into (National Coal Board Committee for), 490
Human Red Cells : Transformation of the *Lewis* Groups of (Mrs. Joan S. Sneath and P. H. A. Sneath), 172
Human Serum : Inhibition of Acyl Trypsins by (Dr. M. Bier, J. Sri Ram and Prof. F. F. Nord), 789
Human Skull Bone : Portion of a, discovered at Swanscombe by Mr. and Mrs. B. O. Wymer, J. Wymer and Adrian Gibson, 287
Human Urine : Identification of $N^2$-Methylguanine (2-Methylamino-6-hydroxypurine) as a Normal Constituent of (Bernard Weissmann, Philip A. Bromberg and Alexander B. Gutman), 1217
Humane Killing of Animals, 862
Humanities : Science and the, *review* by Prof. C. A. Coulson, 846
Humans (Normal) : Genetic Control of some Serum Proteins in (Dr. O. Smithies and Dr. Norma Ford Walker), 1265
Humidities (High) : Counting Tritiated Water at, in the Geiger Region (Edward B. Butler), 1262
Humidity and Corrosion (H. R. Ambler), 1082
Humphrey, Prof. George, and others : New High-speed Electronic Tachistoscope, 231
Humphrey, J. H. : Origin of Blood Platelets, 38
Humphreys, O. W. : The Education and Training of Graduate Staff for Industrial Research, 141
Humphreys, R. : Appointed lecturer in civil engineering at the University of Birmingham, 15
Hundred Years of Technological Training and Research in Switzerland (Prof. Max Wildi), 758
Hungarian Academy of Science : Diploma of honorary fellowship presented to Prof. J. Heyrovsky, 865
Hungarian Academy of Science, and others : First Hungarian–Czechoslovak Polarographic Conference, 865
Hungarian Chemical Society, and others : First Hungarian–Czechoslovak Polarographic Conference, 865
Hungarian–Czechoslovak Polarographic Conference (Prof. J. Heyrovsky), 865
Hungary : Biochemical and Microbiological Research in—Some Impressions (Dr. M. R. Pollock), 1156
  Development of Polarography in (Prof. L. Erdey-Gruz), 866
  Kossuth Prizes for Research in, 14
Hunsaker Chair of Aeronautical Engineering at the Massachusetts Institute of Technology, 768
Hunt, B. B. : Elected by the Salters' Company to be a Salters' Scholar for 1955–56, 195
Hunt, J. L. : Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Hunt, K. G. : Subject Specialization and Co-operative Book Purchase in British Libraries, 62
Hunter, Dr. A. : Solar Physics, *review*, 5
Hunter-Jones, P. : Locust Phases, 591
Huntingford, G. W. B. : Disposal of the Dead, and Beliefs in an After-Life, 810
Huntley, Prof. H. E. : Radioactivity in Quartz Inclusions, 1229
Hurley, T. F. : Combustion in Theory and Practice, 1239
Husbandry : Postgraduate Scholarships in (Department of Agriculture for Scotland Awards), 677
Hutchinson, D. A. : Chemical Effects of Ionizing Radiation, 197
Hutchinson, Major D. V. : Automatic Plotting Machines for 1/1,250 Air Survey, 1057
Hutchinson, Dr. G. W. : Appointed lecturer in physics at the University of Birmingham, 15
Hutchinson, Dr. J. C. D. : Energy Value of Food, 152
Huthnance, S. L. : Appointed deputy provincial director for the West Midland Province of Britain, National Agricultural Advisory Service, 957
Hutt, Prof. F. B., and Cole, R. K. : Resistance to Lymphomatosis in the Fowl in relation to Reproduction, 1178
Hutter, Dr. O. F., and Trautwein, Dr. W. : Effect of Vagal Stimulation on the Sinus Venosus of the Frog's Heart, 512
Hutton, Sir Thomas : Work Study, 659
Huxley, A. F., and Taylor, Dr. R. E. : Function of Krause's Membrane, 1068
Huxley-Wilberforce Debate—a Postscript (Cyril Bibby), 363
Hybridization : Unilateral (B. J. Harrison and L. A. Darby), 982
Hyde, H. A. : Atmospheric Pollen, 546
Hydration : Reduction in X-Ray Sensitivity of Seeds by (Richard S. Caldecott), 306
Hydraulic Design : Irrigation and (Dr. Serge Leliavsky), Vol. 1, General Principles of Hydraulic Design, *review*, 664
Hydraulic Engineering : A Reference Work of, *review*, 664
Hydraulic Mineral Oils : Spot Chromatography of, using Fuller's Earth (J. E. C. Stringer), 81
Hydraulics Research Station, Wallingford : Report for 1954, 193
Hydrazide (*iso*Nicotinic) : Mode of Action of (Dr. J. Cymerman-Craig, D. Willis, Prof. S. D. Rubbo and Janice Edgar), 34
Hydrazide (Maleic) : Effect of 2,4-Dichlorophenoxyacetic Acid and, on Potato Proteins as shown by Paper Electrophoresis (Grace K. Yasuda, Merle G. Payne and Jess L. Fults), 1029
Hydrazine : Reduction of Cytotoxic Azo Compounds by, and by the Xanthine Oxidase–Xanthine System (Dr. W. C. J. Ross and G. P. Warwick), 298
Hydrocarbons (Polar), Polar Polymers, Proteins and Polypeptides : Formation of Complexes of Fluorocarbons and Fluorocarbon Derivatives with (H. B. Klevens), 879
Hydrocortisone : Deposition Induced by, of Calcium in the Heart Tissue of Female $C_3H$ Mice (Ardis Lostroh and Prof. Choh Hao Li), 504
  Production of Dystrophic Calcification of Cardiac Muscle in Mice by (Lowell L. Sparks, Werner Rosenau, Rex N. MacAlpin, Thomas A. Deane and Prof. Choh Hao Li), 503
Hydrocortisone Administration : Changes in Animal Tissue after—Production of Dystrophic Calcification of Cardiac Muscle in Mice by Hydrocortisone (Lowell L. Sparks, Werner Rosenau, Rex N. MacAlpin, Thomas A. Deane and Prof. Choh Hao Li), 503 ; Deposition Induced by Hydrocortisone of Calcium in the Heart Tissue of Female $C_3H$ Mice (Ardis Lostroh and Prof. Choh Hao Li), 504
Hydrodynamics : Cavitation in (Symposium at the National Physical Laboratory), 195, 381, 808
Hydrogen : Growth of Pre-Breakdown Ionization Currents in (Dr. R. W. Crompton, Dr. J. Dutton and Dr. S. C. Haydon), 1079
  Interstellar (International Scientific Radio Union, Special Report No. 5), 1110
  Mechanism of Uniform Field Breakdown in (A. Wilkes, W. Hopwood and N. J. Peacock), 837
Hydrogen (Meteoritic) : Isotopic Composition of (George Edwards), 109
Hydrogen Gas : Modification of X-Ray Sensitivity of Bean Roots by (Dr. Michael Ebert and Dr. Alma Howard), 828
Hydrogen Isotope Exchange between Aromatic Molecules and Aqueous Acids (Dr. V. Gold and D. P. N. Satchell), 602
Hydrogen and Nitrogen Dioxide : Thermal Reaction between (Dr. P. G. Ashmore and B. P. Levitt), 1013
*Hydroides norvegica* in the Mediterranean : Mode of Cleavage of the Eggs of (Prof. Alexander Wolsky), 75
'Hydrolysis' of Nucleic Acids with Phosphorus Pentoxide : A New Method for (M. V. Narurkar and M. B. Sahasrabudhe), 883
Hydromagnetic Waves in Ionized Gas (Dr. J. H. Piddington), 508
Hydroxylated Œstradiols : *In vitro* Stimulation of Incorporation of Formate-$^{14}C$ in Surviving Uterine Segments by (Dr. Gerald C. Mueller), 127
5-Hydroxytryptamine : Role of, in Mental Diseases and its Antagonism to Lysergic Acid Derivatives (A. Cerletti and Prof. E. Rothlin), 785
Hylander, Nils : Vascular Plants of North West Europe, 492
Hyman, R. A., and Tomlin, Dr. D. H. : Fixation of Iodine in Selenium, 977
Hynek, Dr. A. : Astronomical Seeing, 865
Hypercapnia : Effect of Isolated Cerebral Hypoxia and, on Sodium Excretion (M. Foldi, A. G. B. Kovách and L. Takacs), 120
Hyperfine Structure of Radioactive Silver, $^{111}_{47}Ag$ : Nuclear Spin and (G. K. Woodgate and R. W. Hellwarth), 395
Hyperthyroid Rat : Protective Action of Vitamin $B_1$ in the (Dr. Prema Fatterpaker, Urmila Marfatia and Prof. A. Sreenivasan), 165
Hypomagnesaemia in Dairy Cattle and its Possible Relationship to Ruminal Ammonia Production (M. J. Head and J. A. F. Rook), 262
Hypothalamus : Selective Digestion of the Neurosecretory Material of the, and of the Neurohypophysis, by Tissue Homogenates (A. Berardo, W. A. Hadler and J. H. Tramezzani), 600
  Use of the Gless Silver Technique in the (W. M. Cowan and T. P. S. Powell), 1124
Hypothermia : Effects of, on Behaviour (R. K. Andjus, F. Knöpfelmacher, Prof. R. W. Russell and Audrey U. Smith), 1015
Hypoxia (Isolated Cerebral) : Effect of, and Hypercapnia on Sodium Excretion (M. Foldi, A. G. B. Kovách and L. Takacs), 120

IBBOTSON, A. (Gray, Dr. G. W., and) : A Projection Instrument to aid in the Determination of Mesomorphic and Polymorphic Transition Temperatures, 1160
Ibbott, F. A. : Error Induced in Volumetric Glassware by Drying and Sterilization with Heat, 730
Ice (Snow and) : Some Recent Experiments in Friction—Friction on, and the Development of some Fast-Running Skis (Dr. F. P. Bowden), 946
Ice Age : Geology of the, *review* by D. F. W. Baden-Powell, 572
Identification of $N^2$-Methylguanine (2-Methylamino-6-hydroxypurine) as a Normal Constituent of Human Urine (Bernard Weissmann, Philip A. Bromberg and Alexander B. Gutman), 1217
Identification of Phenols by Paper Chromatography : Separation and (J. Green and S. Marcinkiewicz), 1172
Identification of Pseudocholinesterase in the Tissues of Ruminants (Prof. B. Mendel and Dr. D. K. Myers), 783
Identification and Pharmacological Properties of a Major Metabolite of Chlorpromazine (Norman P. Salzman, Neil C. Moran and Bernard B. Brodie), 1122
Identity of Cephalosporin *N* and Synnematin *B* (Dr. E. P. Abraham, G. G. F. Newton, B. H. Olson, D. M. Schuurmans, J. R. Schenck, M. P. Hargie, M. W. Fisher and S. A. Fusari), 551
Idle, D. B. : An Auxanometer for Isolated Plant Sections, 778
  Appointed to a fellowship in botany in the University of Birmingham, 1055
Iles, T. D. (Fryer, G., and) : Predation Pressure and Evolution in Lake Nyasa, 470
Illing, Prof. V. C. : Title of professor emeritus in the University of London conferred on, 194
  Retirement as professor of geology (oil technology) in the Imperial College of Science and Technology, 490 ; work of, 490
Illuminating Engineering Society : Leon Gaster Memorial Premium awarded to Dr. W. E. Harper and A. G. Palmer, 724
  Silver Jubilee Commemoration Award awarded to K. R. Ackerman, 724

Imagination (Human): Science and the (Dr. Mary B. Hesse), review by Prof. C. A. Coulson, 846
Imino-Acid (A New), in some Ulmaceae (Prof. Artturi I. Virtanen), 984
Immiscibility (Liquid), in a Silicate Melt (W. A. Cassidy and Prof. E. R. Segnit), 305
Immunity and Development (Prof. F. W. Rogers Brambell), 441; (British Association for the Advancement of Science, Section D (Zoology), Discussion on), 852
Immuno-Electrophoretic Method: A Study of Normal Human Cerebrospinal Fluid by the (Mme. K. Gavrilesco, Mlle. J. Courcon, Mlle. P. Hillion, J. Uriel, J. Lewin and P. Grabar , 976
Immunological Discrimination between the Blood of Normal and of Tumour-bearing Rats (Dr. D. A. Darcy), 643
Impact of Education on Farming (W. B. Mercer), 446
Impact of Science on Management in the Future (British Institute of Management Conference on), 677, 1108
Imperial Chemical Industries, Ltd.: Grant of £300 for three years to Queen's University, Belfast, to support work on heterogeneous catalysis, 57
  Libraries of the Dyestuffs Division of—New Building at Blackley, 151
Imperial Chemical Industries, Ltd., and others: Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
I.C.I. Fellowships (University of Cambridge Awards), 381
Imperial College of Science and Technology, London: Appointment of Dr. J. H. Argyris to the chair of aeronautical structures, 13
  Appointment of Prof. D. G. Christopherson to the chair of applied science in the Mechanical Engineering Department, 13
  Appointment of Prof. A. Porter to the chair of light electrical engineering, 13
  Appointment of Dr. B. G. Peters to the University of London chair of parasitology, 57, 145
  Appointment of Dr. E. A. R. Braude to the University of London chair of organic chemistry, 57, 285
  Appointment of G. Keith Allen to the University of London readership in mining, 57
  Appointment of Dr. J. H. Burgoyne to the University of London readership in chemical engineering, 57
  Appointment of Dr. G. L. Kingston to the University of London readership in physical chemistry, 57
  Appointment of Dr. J. S. Webb to the University of London readership in applied geochemistry, 57
  Title of professor emeritus in the University of London conferred on Prof. V. C. Illing, 194
  Title of professor emeritus in the University of London conferred on Prof. H. H. Read, 194
  Appointment of Dr. Geoffrey Wilkinson to the University of London, chair of inorganic chemistry, 194, 285
  Retirement of Prof. H. H. Read from the chair of geology, 490
  Retirement of Prof. V. C. Illing as professor of geology (oil technology), 490
  Lectures by Dr. Gabriel Kron on the Method of Tearing, 632
  Inaugural Address for the new Session (Dr. R. P. Linstead), 913
  Appointment of N. P. W. Moore to the University of London readership in mechanical engineering, 957
  Appointment of Dr. R. K. S. Wood to the University of London readership in plant pathology, 957
Imperial Forestry Institute, Oxford: Report for 1953–54, 1153
Imperial Tobacco (Great Britain and Ireland) Co., Ltd., and others: Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
Importance of Larval Characters in Classification (British Association for the Advancement of Science, Section D (Zoology), Discussion on), 911
Inability of Varied-Carpet Beetle Larvae (*Anthrenus verbasci* L.) to digest Chitin (Ch. Jeuniaux), 1129
Inactivated Penicillin: Growth-promoting Activity for Pigs of (J. H. Taylor and W. S. Gordon), 312
Inactivation of Phenyl Mercuric Acetate in Groundwood Pulp by a Mercury-resistant Strain of *Penicillium roqueforti* Thom (P. Russell), 1123
'O Inagglutinability': Production of, in Erythrocytes coated with Typhoid Vi and O Antigens (Dr. Maurice Landy and Ruggero Ceppellini), 1266
Inclusion Compounds: Stoichiometry of (Prof. R. M. Barrer), 745
Inclusions (Quartz): Radioactivity in (Prof. H. E. Hartley), 1229
Incompatibility: Monoecy and (E. J. Godley), 1176
Incorporation of Formate-$^{14}$C in Surviving Uterine Segments by Hydroxylated Œstradiols: *In vitro* Stimulation of (Dr. Gerald C. Mueller), 127
Independent Television Authority: Croydon Transmitting Station, 584
Index of Translations of Foreign Scientific Material (Leslie Wilson), 1276
Index Generalis (vingt-et-unième année, 1954–55), *review*, 324
India: *Scientific Research in (Sir Alfred Egerton)*, 492
Indian Botanic Garden: Retirement as superintendent of Dr. K. P. Biswas, 238
  Appointment of Dr. D. Chatterjee as superintendent, 238
Indian Central Jute Committee: Annual Report for 1953–54, 344
Indian Council of Ecological Research: Foundation of the, 1152
Indian Department of Atomic Energy (United Kingdom Atomic Energy Authority and the): Agreement on the promotion and development of the Peaceful Uses of Atomic Energy, 1247
Indian Freshwater Fish: High-potency Vitamin A Oils from (S. Balasundaram, Dr. H. R. Cama, P. R. Sundaresan and T. N. R. Varma), 554
Indian Ink: Effect of, on *Plasmodium berghei* Infections in Mice (O. J. Roberts Loxley), 705
Indicator (Acid-Base): Use of, for Quantitative Paper Chromatography of Sugars (K. J. Gardner), 929
Indo-Pacific Fishes, *Dasyatis uarnak* and *Upeneus moluccensis*, in the Eastern Mediterranean: Two (Dr. A. Ben-Tuvia), 1177
Indole Synthesis by *Escherichia coli* 7–4: Effect of Antibiotics on (Dr. F. Gibson, Marjorie J. Jones and H. Teltscher), 164
3-Indolylacetonitrile within Plant Tissues: Alpha-Oxidation of Omega-(2:4-Dichlorophenoxy)alkanenitriles and (C. H. Fawcett, B. C. Seeley, F. Taylor, Prof. R. L. Wain and F. Wightman), 1026
Indonesia: Haemoglobin E in (Lie-Injo Luan Eng), 469
Induction (Nuclear): A Measurement of the Earth's Magnetic Field by (G. S. Waters), 691
Industrial Fibres: The Electron Microscopy of Textile and other (Electron Microscopy Group of the Institute of Physics Conference on, 632
Industrial Fund for the Advancement of Scientific Education in Schools, 860
Industrial Relations in Britain: Development of, 799
Industrial Research: The Education and Training of Graduate Staff for (Fourth Conference of Industrial Research Directors and Managers), 141
Industrial Research Directors and Managers: Fourth Conference (The Education and Training of Graduate Staff for Industrial Research), 141
Industries (Process): Automatic Control in the (Institution of Chemical Engineers and the Society of Instrument Technology Conference on), 241
Industry: Dust and Health in (British Association for the Advancement of Science, Section I (Physiology), Discussion on), 761
  Peaceful Uses of Atomic Energy—Radioisotopes in Chemistry, Technology and (Dr. Henry Seligman), 854
  Science in (*Sunday Times* and *Research* Essay Competition for 1955), 842
  Social Implications of Automatic Control in, 133
  Titanium in (Stanley Abkowitz, John J. Burke and Ralph H. Hiltz, Jr.), *review* by P. L. Teed, 804
Industry (British): Adoption of the Unified Screw Thread by (Conference at the British Standards Institution), 62
  Standards in (Political and Economic Planning, Broadsheets 381 and 382), 1061
Industry in Basic Research: The Role of (M. E. Spaght), 295
Industry and Commerce in the Manchester Area: Library Resources for (Northern Branch of Aslib Conference on), 198
*Industry and Technical Education* (Report of the Conference organized by the Regional Advisory Council for the Organization of Further Education in the East Midlands and the North Midland Regional Council of the Federation of British Industries), 821
Inexhaustible Sea: The (Hawthorne Daniel and Francis Minot), *review* by Norman Holme, 478
Infantile Rat Pituitaries cultivated *in vitro* and Grafted into the Anterior Eye Chamber of Young Cats: Long-term Transplants of (Dr. P. M. Martinovitch and D. V. Radivojevitch), 699
Infection in the Gold Coast: Apparent Resistance of a Snail to (Fergus S. McCullough), 981
Infeld, Prof. L.: Awarded a Polish Medal for outstanding achievements in theoretical physics, 336
Infinite Abelian Groups (Irving Kaplansky), *review* by Dr. L. S. Goddard, 573
Influence of the Engineer on Sea Transport and Trade (Dr. S. F. Dorey), 442
Influence of Space Flight on Engineering and Science (Milton W. Rosen), 1190
Influenza A Virus (*Mel* and *NWS* Strains of): Apparent Reciprocal Exchange Characters between the, in the Brain of One-day Old Mice (Dr. K. B. Fraser), 212
Information, Central Office of: Reference Pamphlet No. 2, The Commonwealth and Nuclear Development, 334
Information (Scientific): Dissemination of (Dr. T. A. Margerison), 1008
Information Theory: Third London Symposium on, 149; (*Dr. Colin Cherry*), 773
Infra-Red Spectra and the Polymorphism of Glycerides (Dr. D. Chapman), 216
Ingham, J.: Physics of Wool, 714
Ingold, Prof. C. K.: *Obituary* of Dr. Bernard J. Flurscheim, 191
  Advances in Organic Chemistry, 759
Ingold, Prof. C. K. (Dunn, T. M., and): Symmetry of the Second Excited Singlet State of Benzene, 65
Ingold, Prof. C. T.: Cinematography in Scientific Research, 726
Ingram, Dr. D. J. E., and others: *Paramagnetic Resonance Absorption of* Ferrihaemoglobin and Ferrimyoglobin Derivatives, 394
  *Detection of Labile Photochemical Free Radicals by Paramagnetic* Resonance, 1227
Ingram, G. I. C., and others: *Lowered 'Capillary Resistance'* after Iontophoresis of Lysergic Acid Diethylamide, 563
Ingram, M., and Barnes, *Ella*: *Food Microbiology* and Public Health, 374
Inheritance (Cellular): Nucleus and Cytoplasm in (Prof. J. F. Danielli, Dr. I. J. Lorch, Dr. M. J. Ord and Miss E. G. Wilson), 1114
Inheritance (Polygenic), in *Neurospora* (J. A. Paterson), 1274
*Inheritance of Flower Colour* in the Dahlia: Chemistry and (Dr. E. C. Bate-Smith, Dr. T. Swain and Dr. C. G. Nordström), 1016
*Inhibition by Cyanide of the* Photochemical Activity of Isolated Chloroplasts (Norman I. Bishop and John D. Spikes), 307
*Inhibition of Acyl Trypsins* by Human Serum (Dr. M. Bier, J. Sri Ram and Prof. F. F. Nord), 789
Inhibition of Cholinesterase: Effect of, on the Motility of the Small Intestine (Dr. J. Admiraal, Dr. D. K. Myers and J. C. van Houten), 468
Inhibition of Cholinesterases by 1:2:4-Triazoles (Dr. J. B. Polya), 1175
Inhibition of Complement Activity by Di-isopropyl Fluorophosphate (Dr. Elmer L. Becker), 1073
Inhibition of Histamine Release in Anaphylaxis (Dr. J. L. Mongar and Dr. H. O. Schild), 163
Inhibition of the Production of Precipitating Antibodies in Young Rabbits (A. E. R. Downe), 740
Inhibition of Trypsin by Diethyl *p*-Nitrophenylphosphonate: Site of (T. Viswanatha and I. E. Liener), 1120
Inhibition Steps in Sulphonamide Bacteriostasis (H. R. Almochandani and Dr. A. Sreenivasan), 702
Inhibition Zones (Antibiotic): Theory of, in Agar Media (Prof. K. E. Cooper), 510
Inhibition, Restoration and Enhancement of Proteolytic Action of Polylysine and Polyglutamic Acid (Eva Er Dellert and Dr. Mark A. Stahmann) 1028
Inhibitors (Crystalline), of Trypsin from Potato (Prof. Kamala Sohonie and K. S. Ambe), 972
Initial Moisture Content: Effect of Temperature and, on the Heat of Wetting of Wood (Kathleen E. Kelsey and L. N. Clarke), 83
Inland Fisheries Training Centre in Java (United Nations Food and Agriculture Organization), 909
Innervated Rat Diaphragm Preparation: Some Differences in the Effects of *Different Sympathomimetic Amines on the Isolated* (Dr. Katharine A. Montagu), 738

Inokuchi, H. : Awarded a Ramsay Memorial Fellowship for 1955–56, 336
Inokuchi, Kiyoshi, and others Electron Microscopic Observation of Monolayers of Synthetic Linear Polymers, 1117
Inokuchi, Teiko, and others Electron Microscopic Observation of Monolayers of Synthetic Linear Polymers, 1117
Inorganic Chemistry Comprehensive (edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted), Vol. 2, Copper, Silver, Gold (J. W. Lane) ; Vol. 3, The Halogens (Prof. Robert C. Brasted), *review* by H. A. C. McKay, 229
  Treatise on, *review* by H. A. C. McKay, 229
Inorganic Chemistry (Analytical) : Principles of, *review* by Dr. Albert Wassermann, 1137
Inositol-deficient Yeast · Fat Production by (Dr. S. W Challinor and N. W. R. Daniels), 1267
Insect Metamorphosis · The Physiology of (Prof. V. B. Wigglesworth), *review* by Prof. J. F. Danielli, 136
Insect Populations Interaction of Spray Programmes and, 902
Insect Traps · Selection of Aphid Species by Different Kinds of (V. F. Eastop), 936
Insecticide Manufacturers (British), Association of, and others : First National Crop Protection Conference (Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture), 1203
Insecticides (Natural), in West Africa (Dr. F. R. Irvine), 964
Insects : Classification of (Prof. Charles T Brues, Prof. A. L. Melander and Prof. Frank M. Carpenter), new edition, *review* by Dr. H. E. Hinton, 46
  Golgi Bodies in Nerve Cells of (S. K. Malhotra), 886
Insects as Vectors of Plant Viruses A Combined Aspirator and Feeding Cage for the Collection and Testing of (J. T. Legg), 609
Instability of the Earth's Axis (Dr. C. B. Goodhart), 349 ; (Dr. H. Hamshaw Thomas), 349
Institut fur Harteprüftechnik (Arbeitsgemeinschaft fur Fertigungstechnisches Messwesen and the) International Conference on Hardness Measurement in the Works, 194
Institut pour la Recherche Scientifique en Afrique Centrale . Cinquième Rapport Annuel, 387
Institut Royal des Sciences Naturelles de Belgique : Volume Jubilaire—Victor Van Straelen, *review* by Dr. L. Harrison Matthews, 413
Instrument for Measuring Soil-Moisture Deficit (G. Stanhill and E. J. Winter), 1276
Instrument Engineering (Charles Stark Draper, Prof. Walter McKay and Prof. Sidney Lees), Vol. I, Methods for Describing the Situations of Instrument Engineering ; Vol. 2, Methods for Associating Mathematical Solutions with Common Forms, *review* by Dr. G. D. S. MacLellan, 275
Instrument Industries Exhibition 1955 . British, 140
Instrument Technology, Society of (Institution of Chemical Engineers and the) : Conference on Automatic Control in the Process Industries, 241
Instrumentation : Laboratory Apparatus and Techniques, with particular reference to (Manchester and District Section of the Royal Institute of Chemistry Exhibition of), 1104
  Polarographic (Polarographic Society Symposium on), 198
Instrumentation and Accessories : Radio Isotope (Dr. D. Taylor and A. G. Peacock), 1102
Insulin : Action of, on Thiamine Phosphorylation *in vitro* (N. Siliprandi, V. Boffi and A. Lucarelli), 219
  The Chemistry of (Dr. F. Sanger), 586, 1001
  The Chemistry of, 1001
Insulin in N,N-Dimethylformamide Molecular Weight of (Dr. E. Douglas Rees and Dr. S. J. Singer), 1072
Insulin-treated and Adrenalectomized Rats . Adrenaline and Noradrenaline in Tissues of Normal, (Dr. Katharine Montagu), 555
Insulin Activity of Cord Plasma (R. F. Santos, Prof. R. A. McCance and P. J. Randle), 115
Inter-University Council for Higher Education Overseas : Appointment of Sidney John Worsley as secretary, 336
Interaction of Spray Programmes and Insect Populations, 902
Interaction (Direct), between Copper Ions in the Molecules of Copper Acetate and Propionate (Ryutaro Tsuchida and Shoichiro Yamada), 1171
Interactions of Nitrogen, Phosphorus and Potassium on Sugar-Beet (G. N. Thorne), 344
Interfaces in Oil Pipelines . A Method of Locating (D. B. Smith and G. R. Church), 223
Interference to the Ultra-Violet Spectrophotometry of Barbiturates (Dr. A. S. Curry), 877
Interference between Variants of Pseudorabies Virus demonstrable in Tissue Culture (Dr. George Ivánovics, Helena Báládi and Ervin Szolnóky), 972
Interference Microscope · A Critical Method of Measuring the Diameter of Living Bacteria with the (K. F. A. Ross), 1076
Interference Optical Alinement Method (G. A. Harle and B. S. Thornton), 651
Interference Photography of the Chromospheric Spectrum (Dr. P. J. Treanor), 1166
Interferometry : Reverse-Shearing (J W. Gates), 359
Interlamellar Sorption Complexes of Graphitic Acid with Organic Substances (J. Cano Ruiz and Dr. Douglas M. C. MacEwan), 1222
Intermetallic Semiconductors (Symposium at the Services Electronics Research Laboratory, Baldock), 341
Intermolecular Forces and the Properties of Fluids : Applications of Spectroscopy to Chemical Problems and on (Summer School at the University of Cambridge), 1104
International Astronomical Union : Ninth General Assembly, 336
  General Assembly in Dublin (Prof. R. O. Redman), 626
  Symposium No. 1, Co-ordination of Galactic Research, *review* by Prof. R. O. Redman, 847
International Bank for Reconstruction and Development . Gift of 10,000 dollars to the University of Oxford, for a survey of British experience in the management of capital investment overseas, to be carried out at Nuffield College, 769
International Biometric Symposium in Brazil (Dr. D J. Finney), 1058
International Centre for Scientific Research : The WennerGren, 1196
International Co-operation on Purification of Brackish Water, 286
International Co-ordination of Galactic Research, *review* by Prof. R. O. Redman, 847
International Commission on Radiological Protection : Recommendations of the (Revised December 1954), 375
International Committee for Bird Preservation : Annual Report for 1954, 769
International Concern in the Biological Sciences : Problems of (International Union of Biological Sciences Symposium on), 242
International Conference on Coal Science, 103
International Conference on Hardness Measurement in the Works (Arbeitsgemeinschaft fur Fertigungstechnisches Messwesen and the Institut fur Harteprüftechnik), 194
International Conference on the Peaceful Uses of Atomic Energy (United Nations), 99 ; (Sir John Cockcroft), 482
International Conference on Plant-Growth Substances (Wye College, Ashford), 16 ; (Prof. L. J. Audus), 529
International Congress of Americanists : Thirtieth (Proceedings of the), 1103
International Congress of Biochemistry : Third, 634
International Congress for Cell Biology : Eighth (International Society for Cell Biology), 105
International Congress of Pure and Applied Chemistry : Fourteenth, 58, 759
International Congress on Documentation of Applied Chemistry · First, 956
International Congress of Applied Psychology . Twelfth (Alec Rodger), 449
International Congress on Vitamin E, 149
International Control of Nuclear Weapons, *review* by R. Brightman, 894
International Cosmic Ray Conference : Mexico Meeting, 1105
International Council of Scientific Unions (Mixed Commission on the Ionosphere) · Symposium on Solar Eclipses and the Ionosphere, 947
International Fertility Association Second World Congress on Fertility and Sterility, 817
International Fisheries Convention : Fourth Meeting of the Permanent Commission, 584
International Review of Cytology (edited by Dr. G H. Bourne and Prof. J. F. Danielli), Vol. 3, *review* by Dr. D. R. Newth, 664 ; Vol. 4, *review* by Prof. J. Brachet, 1135
International Research in Radio Astronomy (Dr R. L. Smith-Rose), 1110
International Scientific Radio Union : Proceedings of the Eleventh General Assembly (Dr. R. L. Smith-Rose), 451
  Special Report No. 3, Discrete Sources of Extra-Terrestrial Radio Noise ; Special Report No. 4, The Distribution of Radio Brightness on the Solar Disk ; Special Report No. 5, Interstellar Hydrogen, 1110
International Seaweed Symposium : Second (Dr. E. T. Dewar), 1106
International Union of Biological Sciences : Symposium on Problems of International Concern in the Biological Sciences, 242
International Union of Pure and Applied Chemistry . Eighteenth Conference, 58
  Approval of the recommendation of the Commission of Nomenclature in Inorganic Chemistry that Element 101 by named Mendelevium, symbol Mv, 586
International Union of Crystallography : Symposium on Structure on a Scale between the Atomic and the Microscopic Dimensions, 1153
International Union of Leather Chemists' Societies : Fourth Conference (Dr. K. G. A. Pankhurst), 587
  Symposium on the Properties of Leather, 587
  Symposium on the Fundamentals of the Chemistry of Tanning Processes, 587
International Wool Textile Research Conference, Australia, 1955 (Dr. A. B. D. Cassie and Dr. F. O. Howitt), 712
  Publications of the Proceedings, 957
Interpretation of Science, 753
Interstellar Hydrogen (International Scientific Radio Union, Special Report No 5), 1110
Interval between Milking : Rate of Milk Secretion with Increasing (Gillian M. Elliott and Peter J Brumby), 350
Intestine (Small) · Effect of Inhibition of Cholinesterase on the Motility of the (Dr. J. Admiraal, Dr. D. K. Myers and J. C. van Houten), 468
Intranuclear Changes in the Polyhedroses of *Tipula paludosa* (Diptera), (Dr. Kenneth M. Smith), 255
Intrinsic Value of Science, 409
Inventive Spirit · Textiles and the (J. R. Whinfield), 908
Iodinated Compounds : Anti-tumorigenic Action of (Prof. F. B. Oberhauser, Prof. H. R. Croxatto, M. Q. Gaillard and V. M. Silva), 466
Iodine in Selenium · Fixation of (R. A. Hyman and Dr. D. H. Tomlin), 977
Iodine-131 in the Salivary Glands of the Hamster. Autoradiographic Localization of (B. Cohen, J H. Logothetopoulos and N. B. Myant), 1268
Ion-Exchange Chromatography in Alcohol (Dr. K. K. Carroll), 398
Ion Exchange Membranes : X-Ray Emission Spectrography using (Dr. W. T. Grubb and Dr. P. D Zemany), 221
Ionic Strength (High) . A Crystalline Component of Carp Myogen precipitating at (J. G Henrotte), 1221
Ionization Currents in Hydrogen · Growth of Pre-Breakdown (Dr. R. W. Crompton, Dr. J. Dutton and Dr S. C. Haydon), 1079
Ionized Gas : Hydromagnetic Waves in (Dr. J H Piddington), 508
Ionized Gas in a Magnetic Field : The Four Possible Waves in (Dr. J. H. Piddington), 675
Ionizing Radiation · Chemical Effects of (Société de Chimie Physique Fifth Annual Meeting), 197
  Effect of, on Haemoglobin and Cytochrome c (Dr. H. Laser), 361
  Protection of Deoxyribonuclease from, by Adsorbents (G. L. Fletcher and S. Okada), 882
Ionizing Radiation and the Cell (Prof. G Pontecorvo), 1204
Ionizing Radiations · Protection against (Dr E. H. Belcher), 375
Ionizing Radiations for the Preservation of Food . Scientific and Technological Problems involved in using (Dr R. S. Hannan), 731
Ionosphere Distortion of the *E* Layer of the, by Electrical Currents Flowing in it (Sir Edward Appleton, A. J. Lyon and Mrs. A. G. Turnbull), 897
  Physics of the (Report of the Physical Society Conference at Cambridge, 1954), 731
  Solar Eclipses and the (Mixed Commission on the Ionosphere of the International Council of Scientific Unions Symposium on), 947

Ions : Separation of, at Crystallization of Water (R. Brill and H. Ender), 925
Ions (Chloride), in the Secretion of the Pitcher Plant (Sheilagh Morrissey), 1220
Ions (Copper), in the Molecules of Copper Acetate and Propionate : Direct Interaction between (Ryutaro Tsuchida and Shoichiro Yamada), 1171
Iontophoresis of Lysergic Acid Diethylamide . Lowered 'Capillary Resistance' after (E. L. Blair, Mavis Wakefield, G. L. C. Ingram and P. Armitage), 563
Ireland, A. W. : Appointed deputy director of meteorological services, Nigeria, 1249
Ireland (Northern) : Forestry in (Ministry of Agriculture in Northern Ireland Pamphlet on), 288
Universities of Great Britain and (Report of the Proceedings of the 1954 Conference of the), 195
Iris-Chromatophores . Reaction to Light of (Ernest Middlemiss), 353
Iron produced by a Streptomycete : Ferroverdin, a Green Pigment containing (Prof. E. B Chain, Dr. A. Tonolo and Dr. A. Carilli), 645
α-Iron . Condition of Boron in (W. R. Thomas and G. M. Leak), 29
Iron Meteorites : Uranium Content of Two (Dr. George W. Reed and Dr. Anthony Turkevich), 794
Iron and Steel Institute Eighth Hatfield Memorial Lecture (Dr. E. C. Bain), 725
Meeting of the Iron and Steel Engineers Group, 725
Autumn General Meeting, 725
Irradiated Polythene : *Electric Strength of* (K. H. Stark and C. G. Garton), 1225
Irradiation (Neutron), of the Clathrate with Ammoniacal Nickel Cyanide : Benzene-$^{14}$C-$_1$ from the (Alfred P. Wolf, Carol S. Redvanly and R. Christian Anderson), 831
Irrigation : Plant Climate and (edited by Sidney A Searle), *review* by Prof. R H. Stoughton, 992
Irrigation and Hydraulic Design (Dr. Serge Leliavsky), Vol. I, General Principles of Hydraulic Design, *review*, 664
Irvine, Dr F. R. : Natural Insecticides in West Africa, 964
Isaac, Prof. W. E. : Botany of Seaweed, 1107
Isherwood, F. Appointed scientific officer, entomologist, East Africa High Commission, 1249
Ishihara Test and Defects in Colour Vision (Peter Cavanagh), 816
Islam, M. F. (Ahmed, Dr K., and) . Ramnacin, a New Antibiotic from a *Streptomyces sp.*, 646
Isler, O., and co-workers : Advances in Organic Chemistry, 760
Isocitritase in *Escherichia coli* (Dr. D. T. O. Wong and Dr. Samuel J. Ajl), 970
*iso*Nicotinic Hydrazide : Mode of Action of (Dr. J. Cymerman-Craig, D. Willis, Prof. S. D. Rubbo and Janice Edgar), 34
Isolate of *Rhizoctonia solani* Influence of the Origin of the, on its Pathogenicity (Dr. M. K. Tolba and A. H. Moubasher), 211
Isolated Cell Nuclei · Protein Synthesis in (Dr. V. G. Allfrey, Dr. A. E. Mirsky and Syozo Osawa), 1042
Isolated Cerebral Hypoxia and Hypercapnia : Effect of, on Sodium Excretion (M. Foldi, A. G. B Kovach and L. Takacs), 120
Isolated Chloroplasts : Inhibition by Cyanide of the Photochemical Activity of (Norman I. Bishop and John D. Spikes), 307
Isolated Innervated Rat Diaphragm Preparation : Some Differences in the *Effects of Different Sympathomimetic* Amines on the (Dr. Katharine A. Montagu), 738
Isolated Plant Sections : An Auxanometer for (D. B. Idle), 778
Isolation of Ectotrophic Mycorrhizal Mycelia from Rhizomorphs present in Soil (Dr. Ida Levisohn), 519
Isolation of $\Delta^9$ Heptadecenoic Acid from Lamb Caul Fat (Dr. F. B. Shorland and A. S. Jessop), 737
Isolation of *Microsporum gypseum* and of *Keratinomyces ajelloi* from Australian Soil (E. B. Durie and Dr. D. Frey), 936
Isolation and Properties of a Collagen soluble in Salt Solution at Neutral *p*H (D. S. Jackson and J H. Fessler), 69
Isomer (Vitamin $A_2$) . A Possible New, in the Eyes of Crustaceans (Georg Lambertsen and Olaf R Braekkan), 553
*Isomeris arborea* Nutt · So-called Endosperm Embryos in (Prof. P. Maheshwari and R. C. Sachar), 470
*Isotope Effects* (Carbon-13), *in* the Decarboxylation of some Oxaloacetates (Dr. E. Gelles and Dr. R. L Reed), 1262
Isotope Exchange (Hydrogen), between Aromatic Molecules and Aqueous Acids (Dr. V. Gold and D. P. N. Satchell), 602
Isotope Geology (Prof. *Kalervo Rankama*), *review by Prof. Arthur Holmes*, 1038
Isotope Shifts in the Spectrum of Helium (A. P. Stone), 130
Isotopes (Lithium) : Discrepancy between the Spectro-Isotopic and the Mass-Spectrometric Results for the Natural Abundance Ratio of the (A. H. Gillieson and R. P. Thorne), 1228
Isotopes (Radioactive) : Instrumentation and Accessories for, 1102
Protection from, 769
Isotopes in the Service of Geology, *review* by Prof. Arthur Holmes, 1038
Isotopic Composition of Meteoritic Hydrogen (George Edwards), 109
Isotopic Tracer Technique . Chemistry, Biochemistry and (Dr. G. Popják), 193
Israel Occurrence of Vertebrates in the Triassic of (Dr F. Brotzen), 404
IVA Grand Gold Medal of the Royal Swedish Academy of Technical Sciences conferred on Dr. K H. Gustavson, 910

  Reactions of Herring Larvae to—a Mechanism of Vertical Migration (P. M. J. Woodhead and A. D. Woodhead), 349
Light (New), on an Old Polymer, *review*, 896
Lighting and Vision (British Association for the Advancement of Science, Section I (Physiology), Discussion on), 717
Lignin : Ester Groups in (Dr. D. C. C. Smith), 267
Lignins : Contribution of Residues containing Carbonyl to the Ultra-Violet Absorption of (Dr. D. C. C. Smith), 927
Likelihood Calculation (Maximum), of *Rh* Gene Frequencies in Pacific Populations (Prof. William C. Boyd), 648
Liliaceae : A New Imino-Acid in some (Prof. Artturi I. Virtanen), 984
Lindahl, Prof. Per Eric, and Klein, George : Separation of Ehrlich Ascites Tumour Cells from other Cellular Elements, 401
Lindberg, Dr. B. : Algal Chemistry, 1106
Lindegren, Prof. Carl C. : Is the Gene a Prime Mover ?, 1244
Lindegren, Prof. Carl C., and others : Gene Control of Copper-Sensitivity in *Saccharomyces*, 841
Lindegren, Gertrude, and others : Gene Control of Copper-Sensitivity in *Saccharomyces*, 841
Line, C. : Utilization and Evaluation of Grassland, 764
Linear Polymers (Synthetic) : Electron Microscopic Observation of Monolayers of (Taro Tachibana, Kiyoshi Inokuchi and Teiko Inokuchi), 1117
Linearized Aerodynamics, *review* by Prof. G. Temple, 369
Linearized Theory of Steady High-Speed Flow (Prof. G. N. Ward), *review* by Prof. G. Temple, 369
Lines, G. W. : *Obituary* by T. N. Greeves, 12
Linfoot, Dr. E. H. : Astronomical Seeing, 865
Linggood, F. V., and others : Production of Diphtheria Toxin in Submerged Culture, 1128
Link, F., et Linková, Z. : Évidences Cométaires des variations des Climats, 1152
Linková, Z. (Link, F., et) : Évidences Cométaires des variations des Climats, 1152
Linnett, Dr. J. W. : Advances in Molecular Spectroscopy, 682
  Theory of Molecular Vibrational Spectra, *review*, 1185
Linser, Dr. H., and Kaindl, Dr. K. : Plant Growth Substances, 530
Linsley, Prof. E. Gorton, and others : Methods and Principles of Systematic Zoology, *review* by Dr. H. W. Parker, 711
Linstead, Dr. R. P. : Inaugural Address for the new Session of the Imperial College of Science and Technology, 913
Linzell, J. L., and Mount, L. E. : Variations in the Direction of Venous Blood-flow in the Mammary Region of the Sheep and Goat, 37
Lippold, Dr. O. C. J. : Animal Movement, 1061
Lipsky, S. : Chemical Effects of Ionizing Radiation, 198
Lipson, Prof. H. : Applied X-Rays, *review*, 573
Lipson, Prof. H. (Dunkerley, B. D., and) : A Simple Version of Bragg's X-Ray Microscope, 81
Liquid Drops : Erosion of Surfaces by (D. C. Jenkins), 303
Liquid *n*-Hexane : Radiolysis of, and Solutions of Anthracene in *n*-Hexane (Dr. F. H. Krenz), 1113
Liquid Immiscibility in a Silicate Melt (W. A. Cassidy and Prof. E. R. Segnit), 305
Liquids : A New Thermal Method for Sound Absorption in (Dr. S. Parthasarathy, M. Pancholy and C. B. Tipnis), 611
Liquids (Organic) : Dielectric Strength of (H. House), 610
Liquori, A. M., and others : Sorption Chromatography of Polar Su
on Polyamides, 70

Lison, L., et autres : Vertébrés—Embryologie, grands problèmes d'anatomie comparée, caractéristiques biochimiques (Traité de Zoologie, publié sous la direction de Pierre-P. Grassé, Tome 12), *review* by Prof. C. H. O'Donoghue, 756
Liston, J. (Shewan, J. M., and) : Food Microbiology and Public Health, 374
Literature of Forestry—an Appraisal, 1199
Literature of the Sciences of the Past, *review* by Prof. E. N. da C. Andrade, 663
Lithium Isotopes : Discrepancy between the Spectro-Isotopic and the Mass-Spectrometric Results for the Natural Abundance Ratio of the (A. H. Gillieson and R. P. Thorne), 1228
Littler, D. J. (Gaunt, Dr. J., and) : Peaceful Uses of Atomic Energy—Reactor Physics and Chemistry, 619
Littler, Dr. W. B. : Promoted to chief scientific officer and appointed principal director of scientific research (defence), Ministry of Supply, 632
Live Coelacanths (Prof. J. L. B. Smith), 473
Live and Dead Bull Spermatozoa : A New Method for Counting (A. D. Bangham and Dr. J. L. Hancock), 656
Live and Dead Spermatozoa : A New Difference between (Dr. J. L. Hancock and L. G. Shaw), 260
Liver (Rat) : Enzymatic Conversion of Alpha-Formamidinoglutaric Acid to Glutamic Acid by (Alfred G. Knudson, jun.), 830
Liver Nuclei (Rat) : Preservation of, by Potassium Glycerophosphate (J. St. L. Philpot and J. E. Stanier), 1128
Liver Slices : Effect of Thioctic Acid on Glucose Oxidation by (J. Bornstein and Beryl D. Hartman), 788
Liverworts : British Mosses and (Dr. E. Vernon Watson), *review* by Dr. A. Allsopp, 1237
Livestock Productivity : Ecology of Snowdonia—Ecology of (R. Elfyn Hughes), 595
Living Bacteria : A Critical Method of Measuring the Diameter of, with the Interference Microscope (K. F. A. Ross), 1076
Living Cells *in vitro* : Action of Ribonuclease on, and Synthesis of Deoxyribonucleic Acid (H. Firket, S. Chèvremont-Comhaire and Prof. M. Chèvremont), 1075
Livingston, David M. S. : Awarded a postgraduate scholarship in husbandry by the Department of Agriculture for Scotland, 677
Lizards (Anguinomorph) : The Systematic Position of *Lothanotus* and the Affinities of the (S. B. McDowell, jun., and C. M. Bogert), 432
Llewellyn, Prof. F. J. : Appointed rector of Canterbury University College, Christchurch, 725
Lloyd, Major-General Cyril : *Obituary* of Lieut.-Colonel W. French, 813
Lloyd, J. H. : Control Development in Locust Research, 591
Lloyd Jacob, Sir George : Appointed a Trustee of the Ciba Foundation for the Promotion of International Co-operation in Medical and Chemical Research, 1056
Lloyd-Jacob, M. A. (Scott, P. P., and) : Fertility, 340
Local Accessibility, the Hinterlands of Towns and other Centres as determined by an Analysis of Bus Services (compiled by the Ministry of Housing and Local Government), Sheet 1, Scotland and N. England, Sheet 2, the Remainder of England and Wales, 151
Local-lesion Technique : Photo-reactivation of *Botrytis fabae* Sardiña measured by a (F. T. Last and E. W. Buxton), 655
Localization of Sites for Oxidative Phosphorylation : A Method for the (Dr. Britton Chance and Dr. G. R. Williams), 250
Localization (Autoradiographic), of Iodine-131 in the Salivary Glands of the Hamster (B. Cohen, J. H. Logothetopoulos and N. B. Myant), 1268
Localized Corona Discharges at a Negative Electrode (J. S. T. Looms), 977
Locating Interfaces in Oil Pipelines : A Method of (D. B. Smith and G. R. Church), 223
Locating the Spots on a Paper Chromatogram of Tertiary Alkyl Phosphates, Thiolophosphates and Thionophosphates : A General Method for (Dr. Irmgard K. H. Otter), 1078
Location of Enzymes in Mitochondria Fractions (Prof. S. R. Bose), 122
Location on Jupiter of a Source of Radio Noise (C. A. Shain), 836
Lochhead, Dr. A. G. : Retirement as chief of the Bacteriology Division, Science Service, Department of Agriculture, Ottawa, 629 ; work of, 629
Lock, W. O. : High-Energy Nuclear Physics, 371
Lockspeiser, Sir Ben : Foundation-Stone ceremony at the laboratories of the European Organization for Nuclear Research conducted jointly by Max Petitpierre, François Perréard and, 93
  Man and his Machines, 633
  Dissemination of Science, 1008
Lockwood, Dr. J. F. : Elected vice-chancellor of the University of London for the remainder of the University year 1955–56, 957
Locust Research—Discussions in London (P. T. Haskell), 590
Lodge, Dr. A. S. : Visco-elastic Behaviour, 61
  Variation of Flow Birefringence with Stress, 838
Loewinson-Lessing, Prof. F. Y. : A Historical Survey of Petrology (translated from the Russian by Dr. S. I. Tomkeieff), *review* by Prof. Arthur Holmes, 4
Logic (Deductive) : An Introduction to (Prof. Hughes Leblanc), *review* by P. L. G. Rawlins, 1138
Logothetopoulos, J. H., and others : Autoradiographic Localization of Iodine-131 in the Salivary Glands of the Hamster, 1268
Loiseleur, J. : Chemical Effects of Ionizing Radiation, 198
Loiselle, Dr. J. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Lomer, T. R. : Unit-Cell Dimensions of $\gamma$-Lauric and $\gamma$-Myristic Acids, 653
London : Abnormal Smoke Belt over (N. G. Helliwell and M. J. Blackwall), 1248
  Scientific Library Centre in, 955
London Research Station of the Gas Council : Opening of New Laboratories, 1154
London School of Hygiene and Tropical Medicine : Memoir No. 10, The Natural History of Tsetse Flies (Prof. Patrick A. Buxton), *review* by Dr. T. A. M. Nash, 755
  Appointment of Dr. R. S. F. Schilling to the University of London readership in occupational health, 862
Lake, [illegible]ntment of Dr. S. W. Hinds to the University of London reader-
Lake Ny[illegible] public health, 957
  lies), Television and Film Unit at the, 863
London and Home Counties Regional Advisory Council for Higher Technological Education : Sixth Annual Report, 146
Long, D. A. : Advances in Molecular Spectroscopy, 682
Long Ashton Research Station : Field-Day, 290
Long-Distance Plant Dispersal in the North Polar Regions (Dr. Nicholas Polunin), 22
Long-Period Fading in Medium-Wave Radio Signals (M. Srirama Rao and Dr. B. Ramachandra Rao), 459
Long-term Transplants of Infantile Rat Pituitaries cultivated *in vitro* and Grafted into the Anterior Eye Chamber of Young Cats (Dr. P. M. Martinovitch and D. V. Radivojevitch), 699
Longley, Dr. J. B. (Monis, Dr. B., and) : Mucins in the Epithelium of Renal Collecting Tubules, 741
Longrigg, Stephen Hemsley : Oil in the Middle East, *review* by H. B. Milner, 481
Longstreth (Edward) Medals of the Franklin Institute, Philadelphia, awarded to C. Weller and Dr. R. Berriman, 539
Longuet-Higgins, H. C. : Advances in Molecular Spectroscopy, 683
Looms, J. S. T. : Localized Corona Discharges at a Negative Electrode, 977
Loraine, Dr. J. A. : Endocrinology and Ageing, 292
Lorch, Dr. I. J., and others : Nucleus and Cytoplasm in Cellular Inheritance, 1114
Lord, R. C. : Advances in Molecular Spectroscopy, 681
Lostroh, Ardis, and Li, Prof. Choh Hao : Changes in Animal Tissue after Hydrocortisone Administration—Deposition induced by Hydrocortisone of Calcium in the Heart Tissue of Female $C_3H$ Mice, 504
*Lothanotus* : The Systematic Position of, and the Affinities of the Anguinomorph Lizards (S. B. McDowell, jun., and C. M. Bogert), 432
Loud-speaker : Corona Wind (D. M. Tombs), 923
Loutit, Dr. J. F. : Radiobiology, *review*, 230
  Use of Radioactive Materials in Biological Assay, 429
Loutit, Dr. J. F. (Barnes, D. M. H., and) : Progress in Radiobiology, 684
Loutit, J. S. : Auxotrophic Mutants of *Pseudomonas aeruginosa*, 74
Loveday, N. C. : Appointed assistant conservator of forests, Tanganyika, 1249
Lovell, Prof. A. C. B. : Meteor Astronomy, *review* by Dr. J. S. Hey, 135
Lovern, Dr. J. A. : Cholesterol and Fat Metabolism in relation to Diet and Disease, 775
Low, Dr. W. (Geller, Dr. Z., and) : Amplification of 1-cm Waves in the Helium Negative Glow, 1021
Low-Angle Scattering of X-Rays : Structure in Vitreous Silicates as shown by (L. C. Hoffman and W. O. Statton), 561
Low-Temperature Physics : Progress in (edited by Prof. C. J. Gorter), *review* by Dr. D. Shoenberg, 322
Lowe, the late Dr. John : Tuberculosis and Leprosy, 246
Lowenstein, Prof. Otto (Finlayson, L. H., and) : A Proprioceptor in the Body Musculature of Lepidoptera, 1031
Lowered 'Capillary Resistance' after Iontophoresis of Lysergic Acid Diethylamide (E. L. Blair, Mavis Wakefield, G. I. C. Ingram and P. Armitage), 563
Lowery, Dr. H. : *Obituary* of Sir Richard Paget, 1246
Lowndes, Dr. John : *Obituary* of Prof. R. H. A. Plimmer, 283
Lowry, Capt. C. C. : Radio Aids to Hydrographic Surveying, 1057
Lowy, Dr. J. : The Lamellibranch Muscle—Contractile Mechanism, 345
Lowy, Dr. J. (Bowden, J., and) : The Lamellibranch Muscle—Innervation, 346
Loxdey, O. J. Roberts : Effect of Indian Ink on *Plasmodium berghei* Infections in Mice, 705
Lucarelli, A., and others : Action of Insulin on Thiamine Phosphorylation *in vitro*, 219
Luckwill, Dr. L. C., and Woodcock, D. : Plant Growth Substances, 530
Lugg, Prof. J. W. H. : Some Notably High Acuities of Taste for Phenylthiocarbamide, 313
Lukton, Dr. A., and others : Characterization of a Second Pigment in Strawberries, 790
Lumb, Dr. M. : Influence of Antibiotics on Modern Clinical Bacteriology, 730
Lumi- and Meta-Rhodopsin (G. A. J. Pitt and M. Tinkham), 220
Lumry, R., and Smith, E. L. : Physical Chemistry of Enzymes, 959
Lunar Atmosphere : Lunar Occultation of a Radio Star and the Derivation of an Upper Limit for the Density of the (B. Elsmore and G. R. Whitfield), 457
Lunar Eclipse : Photometric Studies of a, 817
Lunar Occultation of a Radio Star and the Derivation of an Upper Limit for the Density of the Lunar Atmosphere (B. Elsmore and G. R. Whitfield), 457
Lunar Research : Recent (Dr. H. P. Wilkins), 239
Lunar Rhythm in the Emergence of an Ephemeropteran (R. Hartland-Rowe), 657
Lunar Topography : Changes in (Dr. H. P. Wilkins), 447
Lund Botanical Society : Vascular Plants of North-West Europe (Nils Hylander), 492
Lundbéck, H. : Food Microbiology and Public Health, 374
Lundgren, Dr. H. P. (Moore, J. E., and) : Chemistry of Wool, 713
Lundin, Prof. H., and Ericson, L.-E. : Algal Chemistry, 1106
Luthy, Mrs. N. : Polarographic Instrumentation, 198
Luttke, W. : Advances in Molecular Spectroscopy, 682
Lyle, Philip : *Obituary* by H. C. S. de Whalley, 534
Lymphomatosis in the Fowl : Resistance to, in relation to Reproduction (Prof. F. B. Hutt and R. K. Cole), 1178
Lyon, A. J., and others : Distortion of the *E* Layer of the Ionosphere by Electrical Currents Flowing in It, 897
Lysergic Acid Derivatives : Role of 5-Hydroxytryptamine in Mental Diseases and its Antagonism to (A. Cerletti and Prof. E. Rothlin), 785
Lysergic Acid Diethylamide : Lowered 'Capillary Resistance' after Iontophoresis of (E. L. Blair, Mavis Wakefield, G. I. C. Ingram and P. Armitage), 563
*Lythrum salicaria* : Double Reduction at the Rosy, or Pink, Locus in (Sir Ronald Fisher and V. C. Fyfe), 1176

MAALØE, O., and others : Turbidimetric Measurement on Synchronized *Salmonella typhimurium* Cultures, 563
Maass, Dr. Otto : Elected an honorary member of the Chemists' Club of New York, 1005

McAlister, Gilbert (edited by) : The Bomb—Challenge and Answer (Prof. Alexander Haddow, Bertrand Russell, Lord Beveridge and Henry Usborne), 522 ; *review* by R. Brightman, 894
MacAlpin, Rex N., and others : Changes in Animal Tissue after Hydrocortisone Administration—Production of Dystrophic Calcification of Cardiac Muscle in Mice by Hydrocortisone, 503
McAndrew, Dr. J., and Scott, Dr. T. R. : Stillwellite, a New Rare-Earth Mineral from Queensland, 509
Macaulay Institute for Soil Research, Aberdeen : Annual Report for 1953–54, 431
  Appointment of Dr. R. L. Mitchell as deputy director, 1249
  Appointment of Dr. E. G. Williams as head of the Department of Soil Fertility, 1249
McBride, J. M. W. : Appointed lecturer in light electrical engineering at Queen's University, Belfast, 1104
Maccabaeans, Society of : Meldola Medal for 1956, 1104
Maccacaro, Dr. G. A. : Cell Surface and Fertility in *Escherichia coli*, 125
McCaig, M. (Gould, J. E., and) : Production of Anisotropy in a Permanent Magnet by Pressure, 977
McCance, Sir Andrew : Non-Destructive Testing, 385
McCance, Prof. R. A., and others : Insulin Activity of Cord Plasma, 115
McClean, Sir Francis : *Obituary* by Prof. F. J. M. Stratton, 534
McClure, Prof. C. F. W. : *Obituary* by Prof. J. D. Boyd, 627
Maccoll, Dr. Allan, and Thomas, Dr. P. J. : A Correlation between the Rates of Unimolecular Pyrolysis of Alkyl Halides in the Gaseous Phase and $S_N1$ Rates in Solution, 392

McGavin, Dr. Stewart, and others : The Polypeptide Chain Configuration of Collagen, 1062
McGavin, Dr. Stewart (Cowan, Dr. Pauline M., and) : Structure of Poly-L-Proline, 501
McGraw, Dr. J. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Machado, A. de Barros : Révision systématique des Glossines du groupe *palpalis* (Diptera), 537
Machine : Hop Picking by, 388
Machines : Man and his (British Association for the Advancement of Science, Section L (Education), Discussion on), 633
McIlhagger, Dr. D. S. : Appointed lecturer in electrical engineering at Queen's University, Belfast, 1104
McInnes, A. A. : Use of Seaweed Meals in Human and Animal Nutrition, 1107
McIntosh, Dr. A. B. : The Culcheth Laboratories of the United Kingdom Atomic Energy Authority Industrial Group, 484
McIntosh, D. : Appointed deputy chief conservator of forests, Northern Region, Nigeria, 1248
McIntyre, N. (Snell, R. S., and) : Effect of Denervation on the Histochemical Appearance of Cholinesterase at the Myoneural Junction, 884
Mackay, Dr. D. M. : Cerebral Activity, 577
McKay, H. A. C. : Treatise on Inorganic Chemistry, *review*, 229
McKay, Prof. Walter, and others : Instrument Engineering, Vol. 1, Methods for Describing the Situations of Instrument Engineering ; Vol. 2, Methods of Associating Mathematical Solutions with Common Forms, *review* by Dr. G. D. S. MacLellan, 275
Mackeith, Dr. R. : Psychology and the Film, 1110
McKellar, Dr. T. P. H. : Appointed lecturer in psychology at the University of Sheffield, 910
MacKenzie, C. P. : Appointed veterinary education officer, Nigeria, 1249
Mackenzie, E. F. (Wilson, M. W., and) : Food Microbiology and Public Health, 374
McKenzie, H. A., and others : Molecular Weight of Ovalbumin and of Bovine Serum Albumin in Urea Solution, 738
MacKenzie, I. M., and Kennedy, R. : Non-Destructive Testing, 386
Mackenzie, Dr. R. C. : Silicate Thesaurus, *review*, 47
Mackey, R. D. : Appointed lecturer in civil engineering at the University of Leeds, 862
McKie, D. : Appointed mineralogical chemist, Tanganyika, 195
Mackinney, Prof. G., and others : Characterization of a Second Pigment in Strawberries, 790
Mackintosh, I. M., and Allen, J. W. : Intermetallic Semiconductors, 342
Mackowsky, Th. : Coal Science, 105
McLean, Dr. I. R. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
McLean, J. D., and others : Structure and Swelling Properties of the Chloroplasts of *Nitella cristata*, 389
MacLellan, Dr. G. D. S. : Measurement and Automatic Control, *review*, 275
McLennan, M. : Elected by the Salters' Company to be a Salters' Scholar for 1955–56, 195
MacLusky, D. S. (Holmes, Dr. W., and) : Animal Production from Grass, 728
McMahon, D. M. : Elected by the Salters' Company to be a Salters' Scholar for 1955–56, 195
McMichael (Leslie) Premium for 1954 of the British Institution of Radio Engineers awarded to Dr. G. N. Patchett, 536
MacMillan, E. W., and Harrison, Prof. R. G. : Fertility, 340
Macmillan, R. H. : Automatic Control and Production, 724
McNair Lectures : The John Calvin (Prof. C. A. Coulson), *review* by Dr. Charles E. Raven, 410
MacNalty, Sir Arthur : *Obituary* of Lord Horder, 489
McNamara, Ellis : Function of the Bower of Bower-birds, 207
MacNaught, Ann B. : Appointed a lecturer in physiology at the University of Glasgow, 957
McNaughton, G. F. : Chemical Effects of Ionizing Radiation, 197
MacOwan, K. D. S. : Appointed director of veterinary services, Kenya, 1248
McQueen, D. R. : Appointed silviculturist, Nyasaland, 1249
MacRae, D. G. : The Revolt against Reason (Social Science), 521
Macrae, J. C., and Ryder, C. : Thermal Expansion of Coal, 265
MacRobert, Prof. T. M. : Higher Transcendental Functions, *review*, 1138
Macromolecular Weight and Size of Deoxypentose Nucleic Acids (Geoffrey L. Brown, Dr. Marjorie B. M'Ewen and Margaret I. Pratt), 161
Macrory, P. A. : Land Use in Britain, 339
McVaugh, Prof. Rogers : Appointed programme director for systematic biology in the Division of Biological and Medical Sciences of the National Science Foundation, Washington, 770
Madrid Observatory Almanac for 1955, 1199
Madsen, T. L. (Polson, Dr. A., and) : A Brain Factor influencing the Viability of Neurotropic Rift Valley Fever, 645
Magat, M. : Chemical Effects of Ionizing Radiation, 197
Magee, J. L. : Chemical Effects of Ionizing Radiation, 197
Magee, Dr. R. H. : Appointed lecturer in inorganic chemistry at Queen's University, Belfast, 1104
Mager, Dr. J. : Influence of Osmotic Pressure on the Polyamine Requirement of *Neisseria perflava* and *Pasteurella tularensis* for Growth in Defined Media, 933
Magnel, Prof. Gustave : *Obituary* by Betty Campbell, 284
Magnet (Permanent) : Production of Anisotropy in a, by Pressure (J. E. Gould and M. McCaig), 977
Magnetic Catalysis of the Decarboxylation of Oxaloacetic Acid (Dr. E. Gelles), 925
Magnetic Field : The Four Possible Waves in Ionized Gas in a (Dr. J. H. Piddington), 875
Magnetic Moment of an Excited State of the Fluorine-19 Nucleus (Dr. P. B. Treacy), 923
Magnetic Properties of Thin Films : Electric and, *review* by Prof. L. F. Bates, 416
Magnetodynamic Cosmogony, *review* by Thomas Gold, 274
Magnetographs : Minor Oscillations of (A. S. Chaubal, D. K. Deshmukh and S. L. Malurkar), 876
Magneto-Hydrodynamics (Royal Society Discussion on), 234
Magnitude and Energy of Earthquakes (Prof. B. Gutenberg and Prof. C. F. Richter), 795
Maheshwari, Prof. P., and Sachar, R. C. : So-called Endosperm Embryos in *Isomeris arborea* Nutt., 470
Maisin, H., and others : Progress in Radiobiology, 683
Maisin, J., and others : Progress in Radiobiology, 683
Major Metabolite of Chlorpromazine : Identification and Pharmacological Properties of a (Norman P. Salzman, Neil C. Moran and Bernard B. Brodie), 1122
Makapansgat Pebble Culture Stratum : The First Australopithecine Fragment from the (Prof. Raymond A. Dart), 170
Makerere College, Uganda : Grant of £50,000 from the Nuffield Foundation towards the work of the Institute of Education, 536
  Grant of £21,900 from the Nuffield Foundation for research on the biology of tropical swamps, to be directed by Prof. L. C. Beadle, 536
Makin, Dr. M. J. : Radiation Damage in Metals, 1147
Malaria : Man's Mastery of (Dr. Paul F. Russell), *review* by Dr. E. Ashworth Underwood, 1040
Malaria in Retrospect, *review* by Dr. E. Ashworth Underwood, 1040
Malaya : Forestry in, 335
Malcolm, B. R., and others : Structure of Polyglycine, 396
Maldague, P., and others : Progress in Radiobiology, 683
Male Sterility in *Nicotiana tabacum* L. : A New Form of (J. G. Rueber and A. Bolton), 314
Maleic Hydrazide : Effect of 2,4-Dichlorophenoxyacetic Acid and, on Potato Proteins as shown by Paper Electrophoresis (Grace K. Yasuda, Merle G. Payne and Jess L. Fults), 1029
Malhotra, S. K. : Golgi Bodies in Nerve Cells of Insects, 886
Malignant Catarrh (Bovine) : Elementary Bodies in (D. Daubney), 518
Malkin, Dr. A. E. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Malpighian Tubes : Incorporation of Phosphorus-32 into the, during the Metamorphosis of *Culex pipiens* (Hans Stich and Sister Mary Grell), 930
Malurkar, S. L., and others : Minor Oscillations of Magnetographs, 876
Mammal Society of the British Isles : Symposium on Myxomatosis, 1155
Mammalian Biochemistry, *review* by Prof. D. C. Harrison, 276

Mammalian Ova : Transfer of, between Species (R. L. W. Averill, C. E. Adams and L. E. A. Rowson), 167
Mammals (Adult) (Rodents) : Demonstrations *in vivo* and *in vitro* of Peristaltic Contractions in the Portal Vein of (Prof. G. Attardi), 76
Mammary Region of the Sheep and Goat : Variations in the Direction of Venous Blood flow in the (J. L. Linzell and L. E. Mount), 37
Man : The Educated, in 1955 (J. F. Wolfenden), 446
  Effect of Heat Stress on Serial Reaction Time in (D. C. Fraser and K. F. Jackson), 976
  Energy Expenditure in (Nutrition Society Symposium on), 538, 951
  Origin of (Prof. J. B. S. Haldane), 169
  Supra Sternal Ossicles in Primates other than (Prof. D. V. Davies), 1130
  Supra-sternal Ossicles in Primates other than—some Isolated Cases in Gorilla and Chimpanzee (Dr. G. T. Ashley), 6(8
Man in a Cold Environment (Prof. Alan C. Burton and Prof. Otto G. Edholm), *review* by Dr. J. R. Brown, 849
Man and Animals, *review* by Prof. F. J. Cole, 418
Man and his Machines (British Association for the Advancement of Science, Section L (Education), Discussion on), 633
Man-made Diamonds (Dr. F. P. Bundy, Dr. H. T. Hall, Dr. H. M. Strong and Dr. R. H. Wentorf, Jun.), 51
Man-power : Educational Policy and, 475
  The Effective Use of (Alec Rodger), 444
  Research in, 43
  Scientific Research and, in the United States, 543
Man-power (Scientific), in Britain and its Utilization, 365, *erratum*, 539
Manpower (Skilled) : A Policy for (National Manpower Council), 43
Man-power Council, National : A Policy for Skilled Manpower, 43
Man-power Problems in Britain : Atomic Energy Developments and, 1183
Man's Mastery of Malaria (Dr. Paul F. Russell), *review* by Dr. E. Ashworth Underwood, 1040
Management : Scientific, 1108
Management in the Future : The Impact of Science on (British Institute of Management Conference on), 677, 1108
Management, British Institute of : Conference on the Impact of Science on Management in the Future, 677, 1108
Managers (Young), in the United States, 775
Manchester Area : Library Resources for Industry and Commerce in the (Northern Branch of Aslib Conference on), 198
Manchester College of Technology : Appointment of Dr. R. H. Peters as the first professor of textile chemistry, 430
  Grant of a Charter (Dr. B. V. Bowden), 812
Mandel, M. : A Generalization of the Concept of Acid-Strength and Acidity, 792
Mandelbrot, Dr. B. : Information Theory, 774
Mandell, Bernard, and others : New High-speed Electronic Tachistoscope, 231
Mandl, Dr. Anita M. : Breeding of Laboratory Animals, 244
Manganese Requirement and Carbon Source in *Chlorella* (Prof. André Pirson and Ludwig Bergmann), 209
Manhajm, J. : Appointed lecturer in mechanical engineering at the University of Birmingham, 862
Manley-Bendall Prize of the Oceanographical Institute of Monaco awarded to Dr. J. N. Carruthers, 16, *erratum*, 58
Mann, Dr. F. G. : Organo-Metallic Compounds, 59
Mann, Dr. I. : A Mobile Bone Meal Factory in Africa, 193
Mann, J., and Merrinan, J. : Advances in Molecular Spectroscopy, 682
Mann, T. R. R. : Awarded a Francis Amory Prize by the American Academy of Arts and Sciences, 723
Manna, Dr. G. K. : Chromosome Number of Human Cervix Uteri, 354
Mansfield, Dr. R. : Intermetallic Semiconductors, 342
Mansl, W., and others : Myxoma Virus in Britain, 783
Manson-Bahr, Sir Philip : Obituary of Dr. J. B. Christopherson, 377
Manton, Prof. I. : Plane of Bilateral Symmetry in Plant Cilia, 123
  Criteria of Species, 676
Manton, Prof. I., and Sledge, W. A. : Cytology and Taxonomy of Ceylon Pteridophyta, 631
Manum, Svein : Pollen-grains and Spores in Coal Deposits of Tertiary Age in West Spitsbergen, 248
Manzoni, Sir Herbert : Land Use in Britain, 339
  Elected chairman of the General Council of the British Standards Institution, 862
Marchetti, M., and others : Relationship between Orotic Acid and Animal Protein Factors of Casein, 464
Marciakiewicz, S. (Green, J., and) : Separation and Identification of Phenols by Paper Chromatography, 1172
Marconi Premium for 1954 of the British Institution of Radio Engineers awarded to W. T. Brown, 536
Marcovitch, H. : Progress in Radiobiology, 683
Maretti, Prof. E. (Ceccato, Prof. S., and) : Information Theory, 774
Mardles, Dr. E. W. J. : Surface Rheology—Annual Conference of the British Society of Rheology, 819
Marfatia, Urmila, and others : Protective Action of Vitamin $B_{12}$ in the Hyperthyroid Rat, 165
Margary, Ivan D. : Roman Roads in Britain, Vol. 1, South of the Foss Way—Bristol Channel, *review* by Sir Mortimer Wheeler, 3
Margerison, Dr. T. A. : Dissemination of Scientific Information, 1008
Margie, M. P., and others : Identity of Cephalosporin *N* and Synnematin *B*, 551
*Marine Biological Association, Journal of the*, Vol. 34, No. 1, 108
Marine Biological Research (Dr. N. B. Eales), 108
Marine Organisms and Biogeochemistry (British Association for the Advancement of Science, Sections D (Zoology), B (Chemistry) and C (Geology), Discussion on), 818
Marine Transport : The Engineer and (Dr. S. F. Dorey), 442
Markowitz, S. : Appointed to a fellowship in physics in the University of Birmingham, 1055
Marland, Pauline M., and others : Experiments on the Complete Suppression of Stammering, 874
Marler, Dr. P. : Characteristics of some Animal Calls, 6
Marrian, Prof. G. F. : Use of Radioactive Materials in Biological Assay, 427
Merrinan, J. (Mann, J., and) : Advances in Molecular Spectroscopy, 682
Marsh, C. A. : Quercetin Glucosiduronic Acid from the French Bean, 176
Marsh, R. W. : Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Marshall, I. D. (Fenner, Prof. Frank, and) : Occurrence of Attenuated Strains of Myxoma Virus in Europe, 782
Marshall, N. B., and others : Herpetichthyes, Amphibioidei, Choanichthyes or Sarcopterygii, 126
Marshall, Dr. W. : Magneto-Hydrodynamics, 236
Marskell, W. E. : Non-Destructive Testing, 385
Marsupial Nuclei : Deoxyribonucleic Acid Content of (J. M. Rendel and G. M. Kellerman), 829
Marten, Dr. G. : Quantitative Separation of B Vitamins by Electrophoresis on Agar Plates, 1064
Martin, Dr. A. J. P. : Chemistry of Wool, 713
Martin, Dr. Angela V. (Brown, Dr. Geoffrey L., and) : Fractionation of the Deoxyribonucleic Acid of $T_2r$ Bacteriophage, 971
Martin, E. M., and Morton, Dr. R. K. : Cytochromes of Microsomal Particles—Cytochrome $b_3$ of Microsomes from Plant Tissues, 113
Martin, J. J. : Chemical Effects of Ionizing Radiation, 198
Martinovitch, Dr. P. M., and Radivojevitch, D. V. : Long-term Transplants of Infantile Rat Pituitaries cultivated *in vitro* and Grafted into the Anterior Eye Chamber of Young Cats, 699
Martyn, Dr. D. F. : Physics of the Ionosphere, 732
Mason, Philip : An Essay on Racial Tension, *review* by Prof. T. S. Simey, 416
Mass-Spectrometric Results for the Natural Abundance Ratio of the Lithium Isotopes : Discrepancy between the Spectro-isotopic and the (A. H. Gillieson and R. P. Thorne), 1228
Massachusetts Institute of Technology : Scholarships to British graduates in science and technology, 381
  Appointment of Prof. W. R. Hawthorne to the Jerome Clarke Hunsaker chair of aeronautical engineering, 768
  Prof. Francis O. Schmitt to take up the special appointment of Institute professor, 814
  Appointment of Prof. Howard F. Taylor to the American Brake Shoe Company chair of foundry metallurgy, 907
  Appointment of Dr. R. R. Doell and Dr. J. W. Winchester as assistant professors in the Department of Geology and Geophysics, 1104
Massachusetts Institute of Technology and the Carnegie Institution of Washington : Vannevar Bush Fellowships in Earth Sciences, 1102
Masses : Human Biology for the, *review* by T. H. Hawkins, 323
Massey, Prof. H. S. W. : High-Energy Nuclear Physics, 371
  Radiative Balance in the Atmosphere, 635
  Awarded the Hughes Medal for 1955 of the Royal Society, 907, 1094 ; work of, 1094
Massey, V., and others : Physical Chemistry of Enzymes, 958
Mastery of Malaria : Man's (Dr. Paul F. Russell), *review* by Dr. E. Ashworth Underwood, 1040
Materials : Plasticity of (Armament Research and Development Establishment Symposium on), 544
Materials (Polycrystalline) : X-Ray Diffraction by (edited by H. S. Peiser, H. P. Rooksby and Dr. A. J. C. Wilson), *review* by Dr. A. Guinier, 710
Materials and Procedures for Genetic Studies of Yeasts : New (Dr. Lynferd J. Wickerham), 22
Mathematical Colloquium, British : Seventh, 58
Mathematical Tables of the National Bureau of Standards, Washington, *review* by J. H. Pearce, 848
Mathematics for Biologists, *review* by Prof. K. Mather, 1136
Mathematics (Applied), at Sheffield, 98
Mather, Prof. K. : Biological Organization (Presidential Address to Section K (Botany) of the British Association for the Advancement of Science), 445
  Genetics and Plant Breeding, 720
  Mathematics for Biologists, *review*, 1136
Mathieson, Dr. G. G. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Mathur, K. B. : Appointed to an I.C.I. fellowship in chemical engineering at the University of Birmingham, 862
Matthews, A. C., and others : Production of Diphtheria Toxin in Submerged Culture, 1128
Matthews, Dr. G. V. T. : Animal Migration, 772
Matthews, Dr. L. Harrison : Problems of International Concern in the Biological Sciences, 242
  Victor Van Straelen, *review*, 413
  Myxomatosis, 1155
Matthey, R., et autres : Vertébrés—Embryologie, grands problèmes d'anatomie comparée, caractéristiques biochimiques (Traité de Zoologie, publié sous la direction de Pierre-P. Grassé, Tome 12), *review* by Prof. C. H. O'Donoghue, 756
Maturation Divisions of the Ova in the Pseudophyllidean Cestode, *Eubothrium crassum* (Bloch), (Dilys Rawson), 167
Mattingly, P. F. : Importance of Larval Characters in Classification, 912
'Mature' Wood Elements : Protoplasts in (Prof. A. J. Eames and Prof. L. H. MacDaniels), 39
Mauritius Institute, 100
  Appointment of J. L. J. Vinson as director, 910
Mavrodineanu, Dr. R., et Boiteux, H. : L'Analyse spectrale quantitative par la flamme, *review* by J. R. Stansfield, 185
Mawson, Dr. C. A. : Meaning of 'Turnover' in Biochemistry, 317
Maximum Likelihood Calculation of *Rh* Gene Frequencies in Pacific Populations (Prof. William C. Boyd), 648
Maxted, Dr. E. B. : Catalysis, *review*, 417
Maxwell (Clerk) Premium for 1954 of the British Institution of Radio Engineers awarded to F. N. H. Robinson, 536
May, L. H. (Porter, H. K., and) : Metabolism of Radioactive Sugars, 107
Maynard, Prof. J. Lewis, and others (edited by) : Comprehensive Inorganic Chemistry, Vol. 2, Copper, Silver, Gold (J. W. Last), Vol. 3, The Halogens (Prof. Robert C. Brasted), *review* by H. A. C. McKay, 229
Mayne, Dr. K. I. (Reasbeck, Dr. P., and) : The Ages and Origin of Meteorites, 186
  Cosmic Radiation Effects in Meteorites, 733
Mayneord, Prof. W. V. : Visual Recording of Radiation Patterns, 14
Mayr, Ernst, and others : Methods and Principles of Systematic Zoology, *review* by Dr. H. W. Parker, 711
Mays, John Barron : Growing Up in the City, *review* by A. N. Oppenheim, 91
Meade, Dr. Margaret : Information Theory, 774
Meakin, Dr. J. W. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102

Meandering Valleys : Bed-width and Wave-length in (Dr. G. H. Dury), 31
Meanders : Erosion in (J. H. Horlock), 1034
Meaning of 'Turnover' in Biochemistry (Dr. C. A. Mawson), 317
Meaning and Mind : Language, (Prof. G. P. Meredith), 674
Meares, J. D. (Macfarlane, Prof. W. V., and) : Modification of the After-Potential of Single Muscle Fibres by 2 : 4-Dinitrophenol, 403
Measurement of Consumers' Expenditure and Behaviour in the United Kingdom, 1920–1938 (Richard Stone), Vol. I, *review*, 4
Measurement of the Earth's Magnetic Field by Nuclear Induction (G. S. Waters), 691
Measurement of the Energy Locally Absorbed from a Gamma-Ray Beam : A Direct (Prof. H. E. Jones, J. P. Bernier and D. V. Cormack), 560
Measurement of High Pressures . A New Method for the Absolute (R. S. Dadson), 188
Measurement of Pressure with the Mercury Barometer (National Physical Laboratory, Notes on Applied Science No. 9), 193
Measurement of Surface Pigmentation in Animals (A. J. Lee), 558
Measurement of Tritium in Water Samples (J. F. Cameron), 1264
Measurement of Ultra-High Vacua : Production and (Dr. J. A. Becker), 452
Measurement (Electrophoretic), of the True Zeta-Potential of Arsenious Sulphide Sol in the Region of Slow Coagulation (Prof. B. N. Ghosh and K. C. Ray), 1080
Measurement (Turbidimetric), on Synchronized *Salmonella typhimurium* Cultures (Dr. V. G. Bruce, K. G. Lark and O. Maaløe), 563
Measurement and Automatic Control, *review* by Dr. G. D. S. MacLellan, 275
Measurements of Retarding Potential on the Hollow Cathode (Dr. A. W. Bright and J. S. Thorp), 1079
Measuring the Diameter of Living Bacteria with the Interference Microscope : A Critical Method of (K. F. A. Ross), 1076
Measuring Photographs, X-Rays and Drawings . A Caliper for (J. M. Tanner and R. H. Whitehouse), 1180
Measuring Soil-Moisture Deficit : An Instrument for (G. Stanhill and E. J. Winter), 1276
Mechanical Deformation of Single Crystals of Alkali Halides : Electrical Effects associated with the (J. E. Caffyn and T. L. Goodfellow), 878
Mechanical Dictionary : Use of a Computing Machine as a (Dr. Andrew D. Booth), 565 ; (Dr. J. C. Kendrew), 984
Mechanical Engineers, Institution of, and others : First meeting of the British Nuclear Energy Conference, 956
Mechanical Properties of Degraded Gelatins (P. R. Saunders and A. G. Ward), 26
Mechanical Properties of Metals, *review* by Dr. K. M. Entwistle, 571
Mechanism of Phase Transformations in Metals (Metal Physics Committee of the Institute of Metals Symposium on), 381
Mechanism of the Reduction of Tetrazolium Salts (B. Jambor), 603
Mechanism of some Reduction Processes Illustrated on a Coenzyme I Model Substance (Dr. Gabriel Stein and Gad Stiassny), 734
Mechanism of Uniform Field Breakdown in Hydrogen (A. Wilkes, W. Hopwood and N. J. Peacock), 837
Mechanisms of Development, *review* by Prof. C. H. Waddington, 477
Mecke, R. : Advances in Molecular Spectroscopy, 681
Medawar, Prof. P. B. : Immunity and Development, 853
Media containing Blood Plasma (Fibrin Structure) : Regeneration of the Filtrable Forms of *Salmonella enteritidis* in (I. Jubász and J. Vadász), 208
Media (Defined) : Influence of Osmotic Pressure on the Polyamine Requirement of *Neisseria perflava* and *Pasteurella tularensis* for Growth in (Dr. J. Mager), 933
Medica : Genetica—Ium Symposium Internationale Geneticae Medicae, 1953 (a cura di Luigi Gedda), *review*, 139
Medical Education in the United States (Commonwealth Fund Grants for), 1102
Medical Laboratory Technology, Institute of . Seventh Triennial Conference, 729
Medical Research Council : Report for 1953–54, 685
  Appointment of Prof. R. C. Garry and H. J. Seddon as members, 725
  Grant of £500 a year to the Department of Organic Chemistry, Queen's University of Belfast, for work on branched-chain carbohydrates, 1104
Medical Research Fellowships (National Research Council of Canada Awards), 102
Medical Sessions at Geneva : Peaceful Uses of Atomic Energy—Biology and (Dr. L. F. Lamerton), 765
Medical Students : Physics for (Dr. J. S. Rogers), third edition, *review* by G. R. Noakes, 185
Medicinal Plants Schemes in India . Appointment of Dr. K. P. Biswas as director-in-charge, 910
Medicine : Genetics and (British Association for the Advancement of Science, Sections D (Zoology), I (Physiology) and J (Psychology), Discussion on), 532
  Lectures on the Scientific Basis of (British Postgraduate Medical Federation), Vol. 2 (1952–53), Vol. 3 (1953–54), *review* by Dr. R. T. Grant, 803
Medicine (Social), at Oxford (Dr. Roy M. Acheson), 57
Medieval Cosmology, *review* by Prof. Herbert Dingle, 45
Mediterranean . Mode of Cleavage of the Eggs of *Hydroides norvegica* in the (Prof. Alexander Wolsky), 75
Mediterranean (Eastern) : Two Indo-Pacific Fishes, *Dasyatis uarnak* and *Upeneus moluccensis*, in the (Dr. A. Ben-Tuvia), 1177
Medium-Wave Radio Signals : Long-Period Fading in (M. Srirama Rao and Dr. B. Ramachandra Rao), 459
Medlicott, Miss H. G. : Appointed map-curator and librarian in the Department of Geography, University of Sheffield, 101
Medulla of Bird-Feathers : Cortex and (Dr. L. Auber), 1218
Medulla (Adrenal), of the Cow : Adenosine Triphosphate in the (Nils-Åke Hillarp, Bodil Nilson and Bertil Hogberg), 1032
Medvedev, S. S. : Chemical Effects of Ionizing Radiation, 197
Mee, L. K. : Progress in Radiobiology, 683
Meers, P. D. : Appointed pathologist, Nigeria, 1249
Meienhofer, J. (Zahn, Prof. H., and) : Chemistry of Wool, 713
Melander, Prof. A. L., and others : Classification of Insects, new edition, *review* by Dr. H. E. Hinton, 46
Meldola Medal of the Society of Maccabaeans, 1104
Mele, A., and others : Sorption Chromatography of Polar Substances on Polyamides, 70
Mellanby, Dr. Kenneth : *Obituary* of Dr. C. H. N. Jackson, 582
Mellander, Stefan (Celander, Dr. Olov, and) : Elimination of Adrenaline and Noradrenaline from the Circulating Blood, 973
Mellon Institute of Industrial Research, Pittsburgh : Appointment of General Matthew B. Ridgway as chairman of the Board of Trustees, 16
  Scientific Research Activities, 1954–55 (Annual Report Series, No. 42), 1205
Melt (Silicate) : Liquid Immiscibility in a (W. A. Cassidy and Prof. E. R. Segnit), 305
Meltzer, J., and others : A New Acaricide, 2,4,5,4′-Tetrachlorodiphenylsulphone, 515
Melville, Prof. H. W. : The Education and Training of Graduate Staff for Industrial Research, 142
  Big Molecules (Christmas Lectures of the Royal Institution), 725, 1056
  Awarded the Davy Medal for 1955 of the Royal Society, 907, 1094 ; work of, 1094
Men and Myths : Animals, (Morus) (Richard Lewinsohn), *review* by Prof. F. J. Cole, 418
Mendel, Prof. B., and Myers, Dr. D. K. : Identification of Pseudocholinesterase in the Tissues of Ruminants, 783
Mendel, Gregor Johann : Life and Work of (Prof. E. O. Dodson), 1151
Mendeleeff (D. I.) and the Periodic System (Dr. S. I. Tomkeieff), 965
Mendelevium, Symbol Mv . Element 101, 586
Mental Diseases : Role of 5-Hydroxytryptamine in, and its Antagonism to Lysergic Acid Derivatives (A. Cerletti and Prof. E. Rothlin), 785
Mental Output : Effect of Foresight and Attitude on (Prof. E. Mira y Lopez), 449
Mentges, Miss Charlotte : Appointed to the educational staff at Brooklyn Botanic Garden, 862
Menzel, Dr. D. : Magneto-Hydrodynamics, 234
Mercer, F. V., and others : Structure and Swelling Properties of the Chloroplasts of *Nitella cristata*, 389
Mercer, W. B. : The Impact of Education on Farming (Presidential Address to Section M (Agriculture) of the British Association for the Advancement of Science), 446
Mercier, Prof. André : At the Conference in celebration of the Jubilee of the Relativity Theory, 330
Mercury Barometer : Measurement of Pressure with the (National Physical Laboratory, Notes on Applied Science No. 9), 193
Mercury-resistant Strain of *Penicillium roqueforti* Thom : Inactivation of Phenyl Mercuric Acetate in Groundwood Pulp by a (P. Russell), 1123
Meredith, Prof. G. P. : Language, Meaning and Mind, 673
Merle, Mlle. M. : Applications of Ultrasonics, 387
Merrill, Prof. Elmer Drew : The Botany of Cook's Voyages and its Unexpected Significance in relation to Anthropology, Biogeography and History, *review* by Dr. Eric Ashby, 850
Merton, Sir Thomas . *Obituary* of Prof. R. W. Wood, 488
Mesenchyme (Tail), of *Rana pipiens* Tadpoles : Deoxyribonucleic Acid Content of Nuclei in (Jerome J. Freed and Elizabeth Ufford Green), 116
Mesomorphic and Polymorphic Transition Temperatures : A Projection Instrument to aid in the Determination of (Dr. G. W. Gray and A. Ibbotson), 1160
Meta-Rhodopsin : Lumi- and (G. A. J. Pitt and M. Tinkham), 229
Metabolic Processes in the Rat Brain during Physical Exercise : Significance of Glutamic Acid in (Dr. R. Vrba), 1258
Metabolism of Nitrogen in Plants (British Association for the Advancement of Science, Section K (Botany), Discussion on), 904
Metabolism of Propionic Acid in Animal Tissues (Dr. Martin Flavin, Priscilla J. Ortiz and Prof. Severo Ochoa), 823
Metabolism of Radioactive Sugars (H. K. Porter and L. H. May), 107
Metabolism in Tardigrades during Active Life and Anabiosis : Rate of (A. Pigon and B. Weglarska), 121
Metabolism of Triaryl Phosphates in Rodents (Dr. D. K. Myers, J. B. J. Rebel, C. Veeger, A. Kemp and E. G. L. Simons), 259
Metabolism of Two Aromatic Amines in the Dog (L. Bradshaw and Dr. D. B. Clayson), 974
Metabolism (Anaerobic), of Thiocyanate by Thiobacilli (J. P. van der Walt and C. D. de Kruyff), 310
Metabolism (Fat) . Cholesterol and, in relation to Diet and Disease (Scottish Branch of the Nutrition Society and the Biochemical Society Symposium on), 288, 774
Metabolite of Chlorpromazine : Identification and Pharmacological Properties of a Major (Norman P. Salzman, Neil C. Moran and Bernard B. Brodie), 1122
Metal Finishing, Institute of : William James Memorial Prize for an essay in metal finishing, 381
  Election of Officers for 1955–56, 770
Metal Surfaces . Charge acquired by Powdered Salts on moving over (Dr. B. A. Cooke), 264
Metallic Transfer in Drilling and its Significance in Orthopaedic Surgery (Dr. F. P. Bowden, J. B. P. Williamson and P. G. Laing), 826
Metallurgical Research in the United States : Trends in (Dr. E. C. Bain), 725
Metallurgical and General Technological Sessions at Geneva : Peaceful Uses of Atomic Energy—Chemical, (Dr. R. Spence), 574
Métallurgie, Société Française de : Annual 'Journées Métallurgiques d'Automne', 288
Metallurgy : Theoretical Structural (Prof. A. H. Cottrell), second edition, *review* by Dr. J. A. Catterall, 229
Metallurgy (Physical) . Fundamentals of, *review* by Dr. J. A. Catterall, 229
Metals : Effects of Adenosine Triphosphate and, upon an Electron Transport System in Mitochondria (Frederic L. Hoch and Bert L. Vallee), 256
  Investigation of the Fatigue of, by X-Ray Scattering (Dr. A. Franks and Dr. J. Holden), 1022
  Mechanical Properties of, *review* by Dr. K. M. Entwistle, 571
  Mechanism of Phase Transformations in (Metal Physics Committee of the Institute of Metals Symposium on), 381
  Radiation Damage in (Metal Physics Committee of the Institute of Metals Discussion on), 1147
  Strength and Resistance of (Prof. John M. Lessells), *review* by Dr. K. M. Entwistle, 571

Metals, Institute of: Appointment of a Nuclear Energy Committee, 1054
Metals, Institute of (Metal Physics Committee): Symposium on the Mechanism of Phase Transformations in Metals, 381
  Discussion on Radiation Damage in Metals, 1147
Metals (Zinc Group): Action of Complexes of the, on the Tail Protein of Bacteriophage $T_2r^+$ (L. M. Kozloff and K. Henderson), 1169
Metamorphosis of *Culex pipiens*: Incorporation of Phosphorus-32 into the Malpighian Tubes during the (Hans Stich and Sister Mary Grell), 930
Metamorphosis (Insect): The Physiology of (Prof. V. B. Wigglesworth), *review* by Prof. J. F. Danielli, 136
Metaphosphate Glass: *F*-Centres in (Sadhan Basu), 265
Metcalfe, C. R.: Systematic Anatomy of the Monocotyledons, 147
Meteor Astronomy (Prof. A. C. B. Lovell), *review* by Dr. J. S. Hey, 135
  Radio Techniques in, *review* by Dr. J. S. Hey, 135
Meteorites: The Ages and Origin of (Dr. P. Reasbeck and Dr. K. I. Mayne), 186
  Cosmic Radiation Effects in (Dr. P. Reasbeck and Dr. K. I. Mayne), 733
  Time Interval between Nucleogenesis and the Formation of (G. J. Wasserburg and R. J. Hayden), 130
  Uranium Content of Two Iron (Dr. George W. Reed and Dr. Anthony Turkevich), 794
Meteoritic Hydrogen: Isotopic Composition of (George Edwards), 109
Meteorological Observations of Solar Radiation during an Eclipse, 1103
Meteorological Office: An Electronic Computer for the, 1054
Meteorological Society, Royal: Election of Officers, 16
Meteorological Society, Royal, and the Council for the Promotion of Field Studies: Vacation Courses in Synoptic Meteorology, 1248
Meteorological Society, Royal (Physical Society and the): Conference on Cloud Physics, 770, 1104
Meteorology: Corrosion and (Major P. A. Cartwright), 748; (Dr. J. C. Hudson), 749
  Tropical (Herbert Riehl), *review* by Prof. P. A. Sheppard, 989
Meteorology (Synoptic): Vacation Courses in (Royal Meteorological Society and the Council for the Promotion of Field Studies), 1248
Metering: Electrical Standards and (Exhibition at the Science Museum, London), 148
Method of Determining Particle Size of Powders (M. L. Lakhanpal, V. D. Anand and Dr. B. R. Puri), 692
Method for the Localization of Sites for Oxidative Phosphorylation (Dr. Britton Chance and Dr. G. R. Williams), 250
Method of Locating Interfaces in Oil Pipelines (D. B. Smith and G. R. Church), 223
Method for Sampling Arthropods and Molluscs from Herbage by Suction (Dr. C. G. Johnson, Dr. T. R. E. Southwood and Mrs. H. Entwistle), 559
Method of Tearing (Dr. Gabriel Kron), 632
Method (A Critical), of Measuring the Diameter of Living Bacteria with the Interference Microscope (K. F. A. Ross), 1076
Method (A General), for Locating the Spots on a Paper Chromatogram of Tertiary Alkyl Phosphates, Thiolophosphates and Thionophosphates (Dr. Irmgard K. H. Otter), 1078
Method (A New), for the Absolute Measurement of High Pressures (R. S. Dadson), 188
Method (A New), for Counting Live and Dead Bull Spermatozoa (A. D. Bangham and J. L. Hancock), 656
Method (A New), for 'Hydrolysis' of Nucleic Acids with Phosphorus Pentoxide (M. V. Narurkar and M. B. Sahasrabudhe), 883
Method (A New), for the Microbiological Assay of Thiamin (Vitamin $B_1$), (J. R. Villanueva), 465
Method (A New Thermal), for Sound Absorption in Liquids (Dr. S. Parthasarathy, M. Pancholy and C. B. Tipnis), 611
Method (A Simplified), of preparing Pure Mono-, Di- and Tri-glycerides (L. Hartman), 1024
Methods in Applied Psychology: Evaluation of, and the Problem of Criteria (Symposium at the Twelfth International Congress of Applied Psychology), 449
Methods and Principles of Systematic Zoology (Ernst Mayr, Prof. E. Gorton Linsley and Prof. Robert L. Usinger), *review* by Dr. H. W. Parker, 711
Methyl Nitrite: Decomposition Flame of (Dr. Peter Gray, A. R. Hall and H. G. Wolfhard), 695
$N^2$-Methylguanine (2-Methylamino-6-hydroxypurine) as a Normal Constituent of Human Urine: Identification of (Bernard Weissmann, Philip A. Bromberg and Alexander B. Gutman), 1217
Methylene Blue: Adsorption of, by High-Silica Sands (G. Mitchell, P. Poole and H. D. Segrove), 1025
Metson, G. H.: Design of Electronic Devices for Production, 1060
Mexican Diploid Species of *Solanum*: Overcoming Cross-Incompatibility among some (Dr. M. S. Swaminathan), 887
Meyer, Prof. E.: Applications of Ultrasonics, 387
Meyer, Prof. M. C.: English translation of Selensky's 'Études morphologiques et systématiques sur les Hirudinées, I, L'Organisation des Ichthyodellides', 15
Meyer-Eppler, Dr. W.: Information Theory, 773
Mice: Effect of Indian Ink on *Plasmodium berghei* Infections in (O. J. Roberts Loxley), 705
  Production of Dystrophic Calcification of Cardiac Muscle in, by Hydrocortisone (Lowell L. Sparks, Werner Rosenau, Rex N. MacAlpin, Thomas A. Deane and Prof. Choh Hao Li), 503
Mice (Female $C_3H$): Deposition Induced by Hydrocortisone of Calcium in the Heart Tissue of (Ardis Lostroh and Prof. Choh Hao Li), 504
Mice (One-day Old): Apparent Reciprocal Exchange of Characters between the *Mel* and *NWS* Strains of Influenza A Virus in the Brain of (Dr. K. B. Fraser), 212
Mice (Wild House): Widespread Distribution of Mutant Alleles (*t*-Alleles) in Populations of (Prof. L. C. Dunn), 1275
Michaelis, Dr. A. R.: Cinematography in Scientific Research, 726
  Scientific Film Archives, 1194
Michel, G.: Advances in Molecular Spectroscopy, 682
Michel-Lévy, Prof. Albert: *Obituary* by Dr. W. Campbell Smith, 11
Michie, Dr. D.: Breeding of Laboratory Animals, 244
Micro Quantities of Calcium: Colorimetric Determination of (T. T. Gorsuch and A. M. Posner), 268
Microbiological Assay of Thiamin (Vitamin $B_1$): A New Method for the (J. R. Villanueva), 465
Microbiological Methods of Estimating Vitamin $B_{12}$: Biological and (Biological Methods Group of the Society for Analytical Chemistry Conference on), 384
Microbiological Research in Hungary: Biochemical and—Some Impressions (Dr. M. R. Pollock), 1156
Microbiology in the Department of Agriculture, Canada, 629
Mibrobiology: Petroleum (Prof. Ernest Beerstecher, Jr.), *review* by H. B. Milner, 139
Microbiology (Chemical), at Oxford, 1002
Microbiology (Food), and Public Health (Society for Applied Bacteriology Symposium on), 373
Microcythaemics: Fitness of—a Correction (Dr. M. Siniscalco), 84
Micro-determination of Phosphorus (D. N. Rhodes), 215
Microfibrillar Substances: Fine Structure of Cellulose and other (V. Balashov and Prof. R. D. Preston), 64
Microfilaraemia in Rock Rabbits (Dr. A. Smith), 38
Micrographs (Electron), from Thick Oxide Layers on Aluminium (C. J. L. Booker, J. L. Wood and A. Walsh), 222
Micro-organisms (Airborne): A Water-soluble Filter for Trapping (Merfyn Richards), 559
Microscope (Bragg's X-Ray): A Simple Version of (B. D. Dunkerley and Prof. H. Lipson), 81
Microscope (Flying-Spot): Counting and Sizing of Particles with the (D. Causley and Prof. J. Z. Young), 453
Microscope (Interference): A Critical Method of Measuring the Diameter of Living Bacteria with the (K. F. A. Ross), 1076
Microscopic Dimensions: Structure of a Scale between the Atomic and (International Union of Crystallography Symposium on), 1153
Microscopical Society, Royal (Industrial Section): Symposium and Exhibition on Fibre Microscopy, 493, 910
Microscopy: Double-Illumination (Prof. M. A. MacConaill), 877
  Fibre (Industrial Section of the Royal Microscopical Society Symposium and Exhibition), 493, 910
  Freshwater (W. J. Garnett), *review* by Dr. John R. Baker, 992
Microsomal Particles: Cytochromes of—Cytochrome $b_5$ of Microsomes from Animal Tissues (Margot Baillie and Dr. R. K. Morton), 111; Cytochrome $b_3$ of Microsomes from Plant Tissues (E. M. Martin and Dr. R. K. Morton), 113
*Microsporum gypseum* and of *Keratinomyces ajelloi* from Australian Soil: Isolation of (E. B. Durie and Dr. D. Frey), 936
Microwave and Radio-frequency Spectroscopy (Faraday Society Discussion on), 18
Middle East: Oil in the (Stephen Hemsley Longrigg), *review* by H. B. Milner, 481
Middle East (Near and): Proceedings of the Conference on the Conservation of Nature in the (Unesco), 58
Middlemiss, Ernest: Reaction to Light of Iris-Chromatophores, 353
Midlands (East) Regional Advisory Council for the Organization of Further Education in the, and the North Midland Regional Council of the Federation of British Industries: Report of the Conference on Industry and Technical Education, 821
Migeotte, Dr. M. V.: Radiative Balance in the Atmosphere, 635
Migration (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 772
Mikulaszek, Prof. E.: Awarded a Polish Medal for his work entitled 'Immunologically Active Polysaccharoses', 336
Miles, Dr. Frank Douglas: Cellulose Nitrate, *review*, 896
Milk (Coconut): Growth Factors and Tumorous Growth in (Prof. F. C. Steward, S. M. Caplin and E. M. Shantz), 537
Milk (Cow's): Occurrence of Different β-Lactoglobulins in (Dr. R. Aschaffenburg and J. Drewry), 218
Milk Secretion: Rate of, with Increasing Interval between Milking (Gillian M. Elliott and Peter J. Brumby), 350
Milking: Rate of Milk Secretion with Increasing Interval between (Gillian M. Elliott and Peter J. Brumby), 350
Millard, Dr. R. S.: Appointed head of the Colonial Section of the Road Research Laboratory, 1101; work of, 1101
Miller, A. A., and Ramsden, F.: Food Microbiology and Public Health, 374
Miller, C. G.: Granted a scholarship by the Salters' Company, 195
Miller, C. W.: Awarded a Premium by the British Institution of Radio Engineers, 536
Miller, Elizabeth M., and others: Colicine *K*, 700
Miller, J. M. (Alperovitch, Edward A., and): Occurrence of Technetium-98 in Nature, 299
Miller, N.: Chemical Effects of Ionizing Radiation, 197
Miller, R. G. J. (Willis, H. A., and): Advances in Molecular Spectroscopy, 682
Millin, Terence J.: Awarded a Francis Amory Prize by the American Academy of Arts and Sciences, 723
Mills, D. L.: Completion of the African Arc of the 30th Meridian, 1057
Milne, Dr. A. (Clark, Dr. R. B., and): Marine Biological Research, 108
Milne, Angela A. (Hueber, H. V., and): Expansion and Deterioration of Ceramic Bodies, 509
Milner, H. B.: Petroleum Microbiology, *review*, 139
  Geology of Petroleum, *review*, 185
  Oil in the Middle East, *review*, 481
Mind: Language, Meaning and (Prof. G. P. Meredith), 674
Mind (Modern): Education and the (Prof. W. R. Niblett), *review* by T. H. Hawkins, 1087
Mind and the Eye (Dr. Agnes Arber), *review* by Dr. Eric Ashby, 369
Miner, R. W. (edited by): Speciation and Variation in Asexual Fungi, 240
Mineral: Stillwellite, a New Rare-Earth, from Queensland (Dr. J. McAndrew and Dr. T. R. Scott), 509
Mineral Nutrients: Removal of, from Tree Crowns by Rain (G. M. Will), 1180
Mineral Oil Fraction (Kuwait): 1:8-Dimethyldibenzothiophen in a (Dr. W. Carruthers), 790
Mineral Oils (Hydraulic): Spot Chromatography of, using Fuller's Earth (J. E. C. Stringer), 81
Mineral Resources Policy in Great Britain (Institution of Mining and Metallurgy Symposium on), 148
Mineralogical Society: Election of Officers for 1955–56, 1005
  Retirement of Dr. L. J. Spencer from the editorship of the *Mineralogical Magazine*, 1005
  Appointment of Dr. M. H. Hey as editor of the *Mineralogical Magazine*, 1005

  Appointment of Dr. N. F. M. Henry as editor of the *Mineralogical Abstracts*, 1005
  Change of address, 1005
Mineralogy and Crystal Structure of Chamosite (R. F. Youell), 560
Mining, Geological and Metallurgical Institute of India : Golden Jubilee of the, 1152
Mining and Metallurgy, Institution of : Symposium on Mineral Resources Policy in Great Britain, 148
Minnis, C. M. Brightening of the Solar Limb in the Far Ultra-Violet, 652
  Solar Eclipses and the Ionosphere, 947
Minor Oscillations of Magnetographs (A. S. Chaubal, D. K. Deshmukh and S. L. Malurkar), 876
Minos : A Handbook of the Palace of, at Knossos, with its Dependencies (J. D. S. Pendlebury), *review* by M. C. B., 526
Minot, Frances (Daniel, Hawthorne, and) : The Inexhaustible Sea, *review* by Norman Holme, 478
Mira y Lopez, Prof. E. : Effect of Foresight and Attitude on Mental Output, 449
Mirsky, Dr. A. E., and others : Protein Synthesis in Isolated Cell Nuclei, 1042
Mitchell, G., and others : Adsorption of Methylene Blue by High-Silica Sands, 1025
Mitchell, G. F. : The Star Carr 'Treasure', *review*, 91
Mitchell, Dr. James M. : Appointed associate director of the National Science Foundation, Washington, 1005
Mitchell, Dr. R. L. Appointed deputy director of the Macaulay Institute for Soil Research, Aberdeen, 1249
Mitchell, S. C. : Appointed lecturer in fuel technology at the University of Leeds, 194
Mitchell, T. J. (Gardner, Dr. R. G., and) : Algal Chemistry, 1107
Mitchison, Dr. N. A. : Immunity and Development, 854
Mitochondria : Effects of Adenosine Triphosphate and Metals upon an Electron Transport System in (Frederic L. Hoch and Bert L. Vallee), 256
  Yeast—Subcellular Units involved in the Synthesis of Respiratory Enzymes in Yeast (Prof. Boris Ephrussi and Dr. Piotr P. Slonimski), 1207 ; Mitochondria and Refractive Granules in the Yeast Cell (Y. Yotsuyanagi), 1208
Mitochondria (Pea-Seedling) : Biochemical Activity of (D. D. Davies), 631
Mitochondria Fractions : Location of Enzymes in (Prof. S. R. Bose), 122
Mitochondria and Refractive Granules in the Yeast Cell : Yeast Mitochondria—(Y. Yotsuyanagi), 1208
Mitosis . Effects of Carbon Tetrachloride on (B. R. Seshachar and Miss Parvathi K. Nambiar), 796
Mitra, Prof. R. P., and Dube, S. S. : Acid Character of some Phenolic Resins in relation to their Structure, 79
Mitton, Dr. R. G. : The Properties of Leather, 587
  The Diffusion of Water Vapour in Leather, 587
Mixtures of Vegetable Oils and Pigments : Effect of Sunlight on (Prof. Frank A. Lee), 463
Mizuno, T., and others . Reaction of Starfish Spermatozoa to Histidine and certain other Substances considered in relation to Zinc, 1068
Mizushima, S. : Advances in Molecular Spectroscopy, 682
M.K.S. Units : Teaching of, *review* by Prof. L. F. Bates, 617
  The Teaching of Electricity, with special reference to the Use of (Science Master's Association), *review* by Prof. L. F. Bates, 617
Mobile Bone Meal Factory in Africa (Dr. L. Mann), 193
Mode of Action of X-Rays and Alkylating Agents A Comparative Study of the (Dr. Iwao Hiroco), 1168
Model Material for Photoelasticity : A New (C. L. Amba Rao), 81
Modern Cytology, *review* by Prof. J. Brachet, 1135
Modern Mind : Education and the (Prof. W. R. Niblett), *review* by T. H. Hawkins, 1087
Modern Physics : The Teaching of, *review* by Prof. H. W. B. Skinner, 942
Modern World Liberty in the, *review* by R. Brightman, 525
  Reason and Survival in the, 521
Modification of the After-Potential of Single Muscle Fibres by 2 : 4-Dinitrophenol (Prof. W. V. Macfarlane and J. D. Meares), 403
Modification of Response to Adrenocorticotrophic Hormone by the Simultaneous Administration of Gonadotrophic Hormones (Barbara E. Clayton and Joyce E. Hammant), 401
Modification of X-Ray Sensitivity of Bean Roots by Hydrogen Gas (Dr. Michael Ebert and Dr. Alma Howard), 828
Moisse, Dr. Virgile : At the Conference in celebration of the Jubilee of the Relativity Theory, 330
Moisture Content (Initial) : Effect of Temperature and, on the Heat of Wetting of Wood (Kathleen E. Kelsey and L. N. Clarke), 83
Mole, R. H. : Progress in Radiobiology, 684
Molecular Arrangement in Crystals of the Southern Bean Mosaic Virus Protein (Dr. Louis W. Labaw and Dr. Ralph W. G. Wyckoff), 455
Molecular Orbital Theory of the Relative Reactivities of Substituted Aromatic Molecules towards Radical Addition (H. H. Greenwood), 1024
Molecular Spectroscopy : Advances in—Meeting in Oxford (Dr. H. W. Thompson), 680
Molecular Spectroscopy Group, European : Meeting in Oxford, 16, 680
Molecular Structure : Chlorophyll Spectra and (J. C. Goedheer), 928
Molecular Structure of the Vitamin : Structure of Vitamin $B_{12}$—The Crystal Structure of the Hexacarboxylic Acid derived from $B_{12}$ and the (Dr. Dorothy Crowfoot Hodgkin, Jenny Pickworth, John H. Robertson, Prof. Kenneth N. Trueblood, Richard J. Prosen and John G. White), 325
Molecular Vibrational Spectra : Theory of, *review* by Dr. J. W. Linnett, 1185
Molecular Vibrations (Prof. E. Bright Wilson, Jr., Prof. J. C. Decius and Prof. Paul C. Cross), *review* by Dr. J. W. Linnett, 1185
Molecular Weight of Insulin in N,N-Dimethylformamide (Dr. E. Douglas Rees and Dr. S. J. Singer), 1072
Molecular Weight of Ovalbumin and of Bovine Serum Albumin in Urea Solution (H. A. McKenzie, M. B. Smith and R. G. Wake), 738
Molecules : Big (Prof. H. W. Melville), 725, 1056
  Sorting (British Association for the Advancement of Science, Section B (Chemistry), Discussion on), 1188
Molecules of Copper Acetate and Propionate : Direct Interaction between Copper Ions in the (Ryutaro Tsuchida and Shoichiro Yamada), 1171
Molecules (Aromatic), and Aqueous Acids : Hydrogen Isotope Exchange between (Dr. V. Gold and D. P. N. Satchell), 602
Molecules (Organic) : Photomagnetism of Triplet States of (Dr. D. F. Evans), 777
Molecules (Substituted Aromatic) : Molecular Orbital Theory of the Relative Reactivities of, towards Radical Addition (H. H. Greenwood), 1024
Möller, Dr. F. : Radiative Balance in the Atmosphere, 635
Møller, Knud Max, and Prescott, David M. : Spectroscopic Observations on Commercial Preparations of Cytochrome *c*, 1121
Mollusca from Herbage A Method for Sampling Arthropods and, by Suction (Dr. C. G. Johnson, Dr. T. R. E. Southwood and Mrs. H. Entwistle), 559
Molybdenum Valency Changes of, during the Enzymatic Reduction of Nitrate in *Neurospora* (Dr. D. J. D. Nicholas and Dr. H. M. Stevens), 1066
Mond Nickel Co., Ltd. : Appointment of Dr. W. Steven as superintendent of the Development and Research Department Laboratory, 632
  Appointment of Dr. G. L. J. Bailey as superintendent of the Platinum Metals Research Laboratory at Acton, 1056
Mond Nickel Fellowships for 1955, 770
Monde . Le Système du (Prof. Pierre Duhem), Tome 6, *review* by Prof. Herbert Dingle, 45
Mongar, Dr. J. L., and Schild, Dr. H. O. : Inhibition of Histamine Release in Anaphylaxis, 163
Monis, Dr. B., and Longley, Dr. J. B. : Mucins in the Epithelium of Renal Collecting Tubules, 741
Monk, A. Design of Electronic Devices for Production, 1060
Monkeys (Rhesus) : Social Behaviour in (Film by M. R. A. Chance), 341
Mono-, Di- and Tri-glycerides : A Simplified Method of preparing Pure (L. Hartman), 1024
Monocotyledons Systematic Anatomy of the (C. R. Metcalfe), 147
Monoecy and Incompatibility (E. J. Godley), 1176
Monograph (A New), on DDT, *review* by Dr. J. R. Busvine, 943
Monolayer Tissue Cultures (Kidney) Growth and Titration of the Viruses of Foot-and-Mouth Disease and Vesicular Stomatitis in (R. F. Sellers), 547
Monolayers of Synthetic Linear Polymers Electron Microscopic Observation of (Taro Tachibana, Kiyoshi Inokuchi and Teiko Inokuchi), 1117
Mont Blanc First Ascent of (Sir Gavin de Beer and Max H. Hey), 100
Montagu, Dr. Katharine : Adrenaline and Noradrenaline in Tissues of Normal, Insulin treated and Adrenalectomized Rats, 555
  Some Differences in the Effects of Different Sympathomimetic Amines on the Isolated Innervated Rat Diaphragm Preparation, 738
Montmorillonite and High Polymers : Complex Formation between (Dr. W. W. Emerson), 461
Monty, Kenneth J., and others : Role of Nucleic Acid and Enzymes in Peptide Chain Synthesis, 597
Mookerjee, Prof. H. K. : *Obituary* by Prof. S. R. Bose, 721
Moon : Observation of the Total Eclipse of the, on January 18–19, 1954 (M. Goley), 817
Moore, B. . Food Microbiology and Public Health, 374
Moore, C. E. Appointed senior soil conservation officer, Gold Coast, 910
Moore, Prof. H. : Title of emeritus professor of glass technology in the University of Sheffield conferred on, 1056
Moore, J. E., and Lundgren, Dr. H. P. : Chemistry of Wool, 713
Moore, N. P. W. : Appointed to the University of London readership in mechanical engineering at the Imperial College of Science and Technology, 957
Moore, Dr. N. W. : Myxomatosis, 1156
Moorhouse, R. G. : High-Energy Nuclear Physics, 372
Moran, Neil C., and others Identification and Pharmacological Properties of a Major Metabolite of Chlorpromazine, 1122
Morgan, Dr. T. N. : Appointed reader in materia medica at the University of Aberdeen, 288
Morris, F. W. : Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Morris, Lady . Voluntary Organizations and Social Progress, 987
Morris, Sir Philip : Education of the Physicist, 678
  The Function of Libraries, 1252
Morris, P. L. : Appointed geologist, British Guiana, 16
Morrissey, Sheilagh Chloride Ions in the Secretion of the Pitcher Plant, 1220
Morrison, Dr. G. A., and others Aeration of Coliform Cultures, 1178
Morrison, Martin, and others : Role of Nucleic Acid and Enzymes in Peptide Chain Synthesis, 597
Morton, Dr. J. E., and Holme, Dr. N. A. : Marine Biological Research, 108
Morton, Dr. R. K. . Physical Chemistry of Enzymes, 959
Morton, Dr. R. K. (Bailie, Margot, and) : Cytochromes of Microsomal Particles—Cytochrome $b_5$ of Microsomes from Animal Tissues, 111
Morton, Dr. R. K. (Martin, E. M., and) : Cytochromes of Microsomal Particles—Cytochrome $b_3$ of Microsomes from Plant Tissues, 113
Morton, W. R. M. . Fertility, 340
Morus (Richard Lewinsohn) : Animals, Men and Myths, *review* by Prof. F. J. Cole, 418
Moruzzi, Prof. G., and others : Relationship between Orotic Acid and Animal Protein Factors of Casein, 464
Moser, H. (Boerstel, R. C. von, and) Progress in Radiobiology, 683
Moss, A. E. : Appointed deputy director of agriculture, Gold Coast, 539
Moss, Dr. T. S. : Intermetallic Semiconductors, 342
Mosses and Liverworts . British (Dr. E. Vernon Watson), *review* by Dr. A. Allsopp, 1237
Motility of the Small Intestine : Effect of Inhibition of Cholinesterase on the (Dr. J. Admiraal, Dr. D. K. Myers and J. C. van Houten), 468
Motility of a Strain of *Pseudomonas viscosa* : Factors Influencing the (Dr. N. W. Preston and Dr. J. C. Sherris), 1220
Mott, Prof. N. F. : Intermetallic Semiconductors, 341
  Vacant Lattice Sites in Crystalline Solids (Presidential Address to Section A (Mathematics and Physics) of the British Association for the Advancement of Science), 439
  Education of the Physicist, 678
  Cinematography in Scientific Research, 726
  Appointed a Department of Scientific and Industrial Research visitor to the Electrical Research Association, 1056
Moubasher, A. H. (Tolba, Dr. M. K., and) : Influence of the Origin of the Isolate of *Rhizoctonia solani* on its Pathogenicity, 211
Mount, L. E. (Linzell, J. L., and) : Variations in the Direction of Venous Blood-flow in the Mammary Region of the Sheep and Goat, 37

Mount Everest Foundation (Royal Geographical Society and the Alpine Club), 239
Mountain Grassland (Natural): Ecology of Snowdonia—Wild White Clover in (A. D. Bradshaw and Tom Pritchard), 596
Mouse Ascites Tumour (Sarcoma 37): Growth of, in Peritoneal Fat (Dr. Peter Warner), 1030
Moussatché, H.: Release of Histamine in Hepatectomized Dogs during Anaphylactic, Peptone and Tryptic Shock, 648
Mowat, W. P.: Appointed scientific officer, plant pathologist, Sarawak, 1249
Mowbray, Dr. J. H.: Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Moxon, G. R., and Perkin, H. J.: Problem of Rewarding Responsibility, 545
Mucins in the Epithelium of Renal Collecting Tubules (Dr. B. Monis and Dr. J. B. Longley), 741
Mucopolysaccharide (Highly Sulphated Acid): Secretion of a, by the Brittle-star, *Ophiocomina nigra* (A. R. Fontaine), 606
*Mucor mucedo*: Zygotropism in (G. H. Banbury), 537
Mueller, Dr. Gerald C.: *In vitro* Stimulation of Incorporation of Formate-$^{14}$C in Surviving Uterine Segments by Hydroxylated Œstradiols, 127
Muhlbock, Dr. O.: Endocrinology and Ageing, 291
Muir, Dr. E.: Tuberculosis and Leprosy, 246
Muir-Wood, Dr. Helen Marguerite: Appointed deputy keeper in the Department of Geology, British Museum (Natural History), 241
Mulholland, R.: Appointed senior agricultural officer, Gold Coast, 195
Mullards, Ltd.: Gift of ten annual subscriptions of £10,000 each to the University of Cambridge for work in radio-astronomy, 286
Muller, Dr. Paul (herausgegeben von): DDT, das Insektizid Dichlordiphenyltrichloräthan und seine Bedeutung, Band 1, *review* by Dr. J. R. Busvine, 943
Mulligan, Dr. W. (Jennings, F. W., and): Use of Radioactive Materials in Biological Assay, 429
Mulliken, R. S.: Advances in Molecular Spectroscopy, 683
Mullins, Dr. B. P.: Flames and Combustion, 771
Mumps Virus: Reproduction of, in the Chorio-allantoic Membrane (Dr. H. L. Wolff), 604
Munro, J.: Reactions to Potato Virus Y, 631
Murphy, Prof. A. J.: Appointed principal of the College of Aeronautics, 55; work of, 55
Murphy, Dr. B.: Positive-Point D.C. Corona, 397
Murray, Dr. John: *Obituary* of Prof. G. F. Shirras, 376
Murray, Dr. Margaret: Disposal of the Dead, and Beliefs in an After-Life, 811
Murray, Dr. R. W.: Nerve Endings as Transducers of Thermal Stimuli in Lower Vertebrates, 698
Muscle: Essential Relaxing Factor in, other than Myokinase and Creatine Phosphokinase (Dr. H. Kumagai, Dr. S. Ebashi and F. Takeda), 166
  The Lamellibranch—Contractile Mechanism (Dr. J. Lowy), 345; Innervation (J. Bowden and Dr. J. Lowy), 346
  Sodium Extrusion in (Prof. F. H. Shaw and Shirley E. Simon), 1031
Muscle (Cardiac), in Mice: Production of Dystrophic Calcification of, by Hydrocortisone (Lowell L. Sparks, Werner Rosenau, Rex N. MacAlpin, Thomas A. Deane and Prof. Choh Hao Li), 503
Muscle Fibres (Single): Modification of the After-Potential of, by 2:4-Dinitrophenol (Prof. W. V. Macfarlane and J. D. Meares), 403
Musculature (Body), of Lepidoptera: A Proprioceptor in the (L. H. Finlayson and Prof. Otto Lowenstein), 1031
Museum Uses of 'Perspex' (R. A. Kennedy), 193
Museums Association: Museums Calendar, 240
  Sixty-first Annual Conference, 246
Museums Calendar for British Museums and Art Galleries (Museums Association), 240
Museums and Art Galleries (British): A Museums Calendar for (Museums Association), 240
Mutant Alleles (t-Alleles) in Populations of Wild House Mice: Widespread Distribution of (Prof. L. C. Dunn), 1275
Mutants (Auxotrophic), of *Pseudomonas aeruginosa* (J. S. Loutit), 74
Mutations in the Syrian Hamster: Two New (Roy Robinson), 353
Mutations (Biochemical), in the Crucifer *Arabidopsis thaliana* (L.) Heynh. (J. Langridge), 260
Myant, N. B., and others: Autoradiographic Localization of Iodine-131 in the Salivary Glands of the Hamster, 1268
Mycelia (Ectotrophic Mycorrhizal): Isolation of, from Rhizomorphs present in Soil (Dr. Ida Levisohn), 519
Mycological Institute: The Commonwealth (Dr. S. P. Wiltshire), 189
Mycology and Bacteriology at the Weizmann Institute of Science, Rehovoth, 1003
Mycorrhizal Mycelia (Ectotrophic): Isolation of, from Rhizomorphs present in Soil (Dr. Ida Levisohn), 519
'Mycostatin' in Cultures of the Virus of Foot-and-Mouth Disease: Control of Yeast Contamination by (Jacqueline O. Wigmore and W. M. Henderson), 516
Myers, Dr. D. K., and others: Metabolism of Triaryl Phosphates in Rodents, 259
  Effect of Inhibition of Cholinesterase on the Motility of the Small Intestine, 468
Myers, Dr. D. K. (Mendel, Prof. B., and): Identification of Pseudocholinesterase in the Tissues of Ruminants, 783
Myogen (Carp): A Crystalline Component of, precipitating at High Ionic Strength (J. G. Henrotte), 1221
Myokinase and Creatine Phosphokinase: Essential Relaxing Factor in Muscle other than (Dr. H. Kumagai, Dr. S. Ebashi and F. Takeda), 166
Myoneural Junction: Effect of Denervation on the Histochemical Appearance of Cholinesterase at the (R. S. Snell and N. McIntyre), 884
γ-Myristic Acids (γ-Lauric and): Unit-Cell Dimensions of (T. R. Lomer), 653
Myths: Animals, Men and (Morus) (Richard Lewinsohn), *review* by Prof. F. J. Cole, 418
Myxoma Virus in Britain (J. R. Hudson, Harry V. Thompson and W. Mansi), 783
Myxoma Virus in Europe: Occurrence of Attenuated Strains of (Prof. Frank Fenner and I. D. Marshall), 782
Myxomatosis (Mammal Society of the British Isles Symposium on), 1155

NAGATA, Dr. T.: Solar Eclipses and the Ionosphere, 948
Nambiar, Miss Parvathi K. (Seshachar, B. R., and): Effects of Carbon Tetrachloride on Mitosis, 796
Nancollas, Dr. G. H. (Howard, Miss J. R., and): Crystallization of Silver Chromate, 833
Naphthalenes and Sterols: Chemistry of, *review* by Dr. J. W. Cook, 523
Napier, R. A. N.: Awarded a postgraduate scholarship in husbandry by the Department of Agriculture for Scotland, 677
Narurkar, M. V., and Sahasrabudhe, M. B.: A New Method for 'Hydrolysis' of Nucleic Acids with Phosphorus Pentoxide, 883
Nash, Dr. T. A. M.: Appointed director of the West African Institute for Trypanosomiasis Research, Kaduna, Northern Nigeria, 241
  Biology of Tsetse Flies, *review*, 755
Nath, Bhola: An Apparent Change from Cytoplasmic to Nuclear Control of a Form of Chlorophyll Deficiency in *Gossypium arboreum* L., 316

  Handbook 54, Protection against Radiations from Radium, Cobalt-60 and Caesium-137, 769
  Tables of Functions and of Zeros of Functions (Applied Mathematics Series, No. 37); Table of Salvo Kill Probabilities for Square Targets (Applied Mathematics Series, No. 44); Tables of the Error Function and its Derivative (Applied Mathematics Series, No. 41), *review* by J. H. Pearce, 848
  Circular No. 551, Engineering Aspects of the Electronic Computer Programme, 1003
National Coal Board: Committee for Research into Human Problems, 490
  Change of titles of the Central Research Establishments, 910
National Coal Board (North-Eastern Division): Gift of £3,000 to the University of Leeds, for the Department of Mining, 194
National Council to Combat Blindness, Inc.: Gift of 2,000 dollars to the University of Oxford, towards the purchase of apparatus for research at the Nuffield Laboratory of Ophthalmology, 769
National Council of Diplomas in Technology in Technical Colleges: Establishment of a, 146
  Appointment of Lord Hives as chairman, 146
National Crop Protection Conference: First, 1203
National Farmers Union, and others: First National Crop Protection Conference (Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture), 1203
National Foundation for Scientific Research, Brussels: Twenty-seventh Annual Report (1953–54), 676
National Fruit and Cider Institute: Fifty-second Annual General Meeting, 290
National Geographic Society—Palomar Observatory Sky Atlas (Sir Harold Spencer Jones), 1148
National Institute of Adult Education: Report on Liberal Education in a Technical Age, 343
National Institute of Agricultural Botany: Address to the Fellows (Sir William Slater), 287
  Annual Report for 1954 (Prof. T. J. Jenkin), 287
National Institute for Research in Dairying: Annual Report, 962
National Institute of Sciences in India: Symposium on High Altitude Research, 448
  *Proceedings* of the, 1055
National Leathersellers College (Dr. J. P. Danby), 1202
National Manpower Council: A Policy for Skilled Manpower, 43
National Museum of Wales: The First Five Years of the Schools Service, 1102
National Oceanographic Council: Annual Report for 1953–54, 247
National Park of the Garamba: Scientific Exploration of the Belgian African (Dr. Tracy Philipps), 1011
National Parks in Great Britain: New, 629
National Physical Laboratory: Notes on Applied Science No. 9, Measurement of Pressure with the Mercury Barometer, 193
  Symposium on Cavitation in Hydrodynamics, 195, 381, 808
  Notes on Applied Science No. 8, Audio-Frequency Power Measurements, 492
  Notes on Applied Science No. 10, Noise Measurement Techniques; No. 11, Wind Effects on Bridges and other Flexible Structures; No. 12, Calibration of Temperature-measuring Instruments, 822
  Report for the Year 1954, 866
  Appointment of Dr. R. L. Smith-Rose as acting director, 1200
National Research Council of Canada: Award of Medical Research Fellowships, 102
National Research Council of Canada (Division of Pure Physics): Colloquium on Theoretical Physics, 588
National Research Council of Egypt: Classified Lists of Egyptian Scientific Papers, Vol. 3 (1953), 676
National Science Foundation, Washington: Appointment of Dr. Helen S. Hogg as programme director for astronomy in the Division of Mathematical, Physical and Engineering Sciences, 770
  Appointment of Dr. Vernon Bryson as programme director for genetic and developmental biology in the Division of Biological and Medical Sciences, 770
  Appointment of Prof. Rogers McVaugh as programme director for systematic biology in the Division of Biological and Medical Sciences, 770
  Appointment of Dr. James M. Mitchell as associate director, 1005
  Appointment of Dr. John T. Wilson as assistant director for biological and medical sciences, 1005

  Appointment of Dr. Alberto F. Thompson as head of the Office of Scientific Information, 1054
  Appointment of Clyde C. Hall as public information officer, 1054
  Appointment of Dr. Detlev Bronk as chairman of the Board, 1200
National Smoke Abatement Society *Smokeless Air*, Vol. 25, No 94, 491
  Annual Conference, 863
Natural Abundance Ratio of the Lithium Isotopes Discrepancy between the Spectro-Isotopic and the Mass-Spectrometric Results for the (A H. Gillieson and R. P. Thorne), 1228
Natural Control of Animal Populations, *review* by C. S. Elton, 419
Natural History of Tsetse Flies (Prof Patrick A. Buxton), *review* by Dr T. A. M. Nash, 755
Natural History Lectures and Films for junior audiences (British Museum (Natural History), Christmas lectures), 1153
Natural Insecticides in West Africa (Dr F R. Irvine), 964
Natural Product Chemistry The Philosophy of, *review* by Prof D H. R. Barton, 1236
Natural Products · The Structural Relations of (Sir Robert Robinson), *review* by Prof D H. R. Barton, 1236
Natural Resources . The Engineer and the Conservation of (E. J. Holmgren), 150
Naturally Occurring Pyrones · Chemistry of (University College, Dublin, and the Institute of Chemistry of Ireland, Symposium on), 637
Nature Occurrence of Technetium-98 in (Edward A Alperovitch and J M Miller), 299
  Pentagonal Symmetry in (C. M Breeder, jun.), 1159
  The Temple of, or the Origin of Society (Erasmus Darwin), (in Russian), *review* by Dr S. L Tomkeieff, 711
Nature in the Near and Middle East Proceedings of the Conference on the Conservation of (Unesco), 58

Neugebauer, O. (edited by) Astronomical Cuneiform Texts, Babylonian Ephemerides of the Seleucid Period for the Motion of the Sun, the Moon and the Planets, Vol 1, Introduction, The Moon , Vol. 2, The Planets, Indices , Vol. 3, Plates, *review* by R. W Sloley, 569
Neuraminic Acid and 2-Carboxy-Pyrrole . Structural Relationship between Sialic Acid, (Dr A Gottschalk), 881
Neurath, Hans, and Bailey, Kenneth (edited by) The Proteins—Chemistry, Biological Activity and Methods, Vol 2, Part B, *review* by N. W. Pirie, 181
Neurath, Hans, and Dreyer, W J : Physical Chemistry of Enzymes, 958
Neurohypophysis Selective Digestion of the Neurosecretory Material of the Hypothalamus and of the, by Tissue Homogenates (A. Berezin, W. A. Hadler and J H Tramezzani), 600
Neurology and Brain Research The Venezuelan Institute for (Dr. Geoffrey H. Bourne), 1049
Neurosecretory Material of the Hypothalamus and of the Neurohypophysis : Selective Digestion of the, by Tissue Homogenates (A Berezin, W. A. Hadler and J H. Tramezzani), 600
*Neurospora* . Polygenic Inheritance in (J. A. Pateman), 1274
  Valency Changes of Molybdenum during the Enzymatic Reduction of Nitrate in (Dr. D. J. D. Nicholas and Dr. H. M. Stevens), 1066
Neurotropic Rift Valley Fever . A Brain Factor influencing the Viability of (Dr A. Polson and T. I Madsen), 645
Neutron Capture (Polarized) : Circular Polarization of Gamma-Rays following (Dr. Georg Trumpy), 507
Neutron Diffraction (G. E. Bacon), *review* by Dr. H. P. Rooksby, 895
  Theory and Practice of, *review* by Dr. H. P. Rooksby, 895
Neutron Irradiation of the Clathrate with Ammoniacal Nickel Cyanide . Benzene-$^{14}C_1$ from the (Alfred P. Wolf, Carol S. Redvanly and R. Christian Anderson), 831
Neutron Yields from Americium–Beryllium Alloys (O J. C Runnalls and R. R Boucher), 1019
Neutrons produced in the Bombardment of Beryllium by Deuterons (Fedor Boreli and Branislav Lalovic), 1021
Neville, Prof E. H. *Obituary* of Dr. J W Nicholson, 1197
New Acaricide, 2,4,5,4′-Tetrachlorodiphenylsulphone (Dr H. O Huisman, Dr R van der Veen and J Meltzer), 515
New Antibiotic from a *Streptomyces* sp. Ramnacin, a (Dr K. Ahmad and M F. Islam), 646
New Class of Compounds containing the Pentacyanoferrate Group and an Unpaired Electron (Dr E F. G Herington), 80
New Constituent of Plants : Azetidine-2-Carboxylic Acid, a (Dr. L. Fowden), 347
New Detector for Vapour-Phase Partition Chromatography (R. P W. Scott), 793
New Difference between Live and Dead Spermatozoa (Dr J. L Hancock and I G. Shaw), 260
New Discovery at Swanscombe, Kent, 287
New Family of Early Primates, 500
New Flavones from *Pongamia pinnata* (L ) Merr.—Identification of Compound *D* (S. K Pavanaram and Dr L. Ramachandra Row), 1177
New Form of Male Sterility in *Nicotiana tabacum* L (J. G. Raeber and A. Bolton), 314
New Free Amino Acids in Plant Materials (Dr. C. B Coulson), 518
New Genus of the Actinomycetales *Chainia*, a (Dr. M. J. Thirumalachar), 934
New Group of DDT Synergists (Dr. Ernst D. Bergmann, A S. Tahori, A. Kaluszyner and S Reuter), 266
New High-speed Electronic Tachistoscope (Prof. George Humphrey, P. G M Dawe and Bernard Mandell), 231
New Imino-Acid in some Liliaceae (Prof. Artturi I. Virtanen), 984
New Light on an Old Polymer, *review*, 896
New Materials and Procedures for Genetic Studies of Yeasts (Dr. Lynferd J. Wickerham), 22
New Method for the Absolute Measurement of High Pressures (R. S. Dadson), 188
New Method for Counting Live and Dead Bull Spermatozoa (A. D. Bangham and J L. Hancock), 656
New Method for 'Hydrolysis' of Nucleic Acids with Phosphorus Pentoxide (M. V. Narurkar and M. B. Sahasrabudhe), 883
New Method for the Microbiological Assay of Thiamin (Vitamin $B_1$), (J. R. Villanueva), 465
New Model Material for Photoelasticity (C L. Ambe Rao), 81
New Monograph on DDT, *review* by Dr. J R. Busvine, 943
New Mutations in the Syrian Hamster Two (Roy Robinson), 353
New National Parks in Great Britain, 629
New Nature Reserves in Britain, 239, 684
New Normal-Pressure Effect : Formation of Tubes by a Simple Rolling Action—a (M. J. Egan and A. Jobling), 689
New Rare Blood-Group Antigen, *Chra* (F. Kissmeyer-Nielsen), 313
New Rare-Earth Mineral from Queensland Stillwellite, a (Dr J. McAndrew and Dr. T. R. Scott), 509
New Reactor at Harwell, 286
New Records in Human Power (Dr. P.-O. Åstrand), 922
New Schmidt Telescope of the Hamburg Observatory (Dr. O Heckmann), 805
New Species of Sporozoan ? (J B. Cowey), 213
New Technique for the Study of Chromosomes of Palms (A. K. Sharma and S. K. Sarkar), 261
New Thermal Method for Sound Absorption in Liquids (Dr S Parthasarathy, M. Pancholy and C. B. Tipnis), 611
New Type of Plant Growth-regulating Substances (Dr. G. J M van der Kerk, Dr. M. H van Raalte, Dr. A. Kaars Sijpesteijn and Dr R. van der Veen), 308
New Utopia (Prof. M S. Viteles), 450
New Vitamin $A_1$ Isomer in the Eyes of Crustaceans · A Possible (Georg Lambertsen and Olaf R. Braekkan), 553
New York Academy of Sciences *Annals* of the, Vol. 60, Speciation and Variation in Asexual Fungi (edited by R W. Miner), 240

Phillips, G. (Wood, L J , and) : Viscoelastic Behaviour, 61
Phillips, J W. : Coal Science, 104
Phillips, O. M. Awarded an I.C.I. Fellowship by the University of Cambridge, 381
Phillips, Dr V. A. · Appointed lecturer in metallurgy at the University of Sheffield, 910
Philosophy of Natural Product Chemistry, *review* by Prof. D H. R. Barton, 1236
Philpot, J. St. L , and Stanier, J. E · Preservation of Rat Liver Nuclei by Potassium Glycerophosphate, 1128
*Phleum pratense* : Ear Formation in Timothy Grass, following Vernalization and Short-day Treatments (Dr. R. H. M. Langer), 263
Phosphates (Pentose) . Transformation of, by Enzymes of Animal Origin (Prof Frank Dickens and D. H. Williamson), 400
Phosphates (Tertiary Alkyl), Thiolophosphates and Thionophosphates: A General Method for Locating the Spots on a Paper Chromatogram of (Dr. Irmgard K. H. Otter), 1078

Phosphates (Triaryl): Metabolism of, in Rodents (Dr. D. K. Myers, J. B. J. Rebel, C. Veeger, A. Kemp and E. G. L. Simons), 259
Phosphokinase (Creatine): Essential Relaxing Factor in Muscle other than Myokinase and (Dr. H. Kumagai, Dr. S. Ebashi and F. Takeda), 166
Phospholipids: Chemistry and Biology of (Biochemistry Division of the Chemical Institute of Canada Symposium on), 241
  Volatile Fatty Acids in (J. C. Hawke), 882
Phosphorescence at Sea: Radar and (Capt. Brett Hilder), 174
Phosphorus: Micro-determination of (D. N. Rhodes), 215
Phosphorus in Silicon: Radioactivation Analysis of (J. A. James and D. H. Richards), 1026
Phosphorus-32: Incorporation of, into the Malpighian Tubes during the Metamorphosis of *Culex pipiens* (Hans Stich and Sister Mary Grell), 930
Phosphorus Absorption in the Sheep: Site of (Evan Wright), 351
Phosphorus Pentoxide: A New Method for 'Hydrolysis' of Nucleic Acids with (M. V. Narurkar and M. B. Sahasrabudhe), 883
Phosphorus and Nitrogen Metabolism in Sweet Potato infected with Black Rot: Respiratory Increase and (Takashi Akazawa and Dr. Ikuzo Uritani), 1071
Phosphorus and Potassium (Interactions of Nitrogen,), on Sugar-Beet (G. N. Thorne), 344
Phosphorylation (Oxidative): A Method for the Localization of Sites for (Dr. Britton Chance and Dr. G. R. Williams), 250
Phosphorylation (Oxidative and Photosynthetic), by Chloroplast Fragments (Takao Ohmura), 467
Phosphorylation (Respiratory Chain), in Extracts of *Azotobacter vinelandii* (Dr. A. Tissières and Prof. E. C. Slater), 736
Phosphorylation (Thiamine), *in vitro*: Action of Insulin on (N. Siliprandi, V. Boffi and A. Locarelli), 219
Photobiology Group: Establishment of a, 379
  Inaugural Meeting, 768
Photochemical Activity of Isolated Chloroplasts: Inhibition by Cyanide of the (Norman I. Bishop and John D. Spikes), 307
Photochemical Free Radicals (Labile): Detection of, by Paramagnetic Resonance (Dr. D. J. E. Ingram, W. G. Hodgson, C. A. Parker and W. T. Rees), 1227
Photochemical Processes in the Reduction of Nitrate by Green Algae: Role of (Dr. Erich Kessler), 1069
Photochemical Processes in Solids at Room Temperature (Roger A. Ford), 1023
Photo-elastic Dispersion in Cubic Crystals (K. S. Iyengar), 1119
Photoelasticity: A New Model Material for (C. L. Amba Rao), 81
Photoelectric Measurements at Kvistaberg Observatory (Åke Wallenquist), 909
Photoelectric Spectrometry Group: Survey of the demand for Solvents for Spectroscopic Purposes, 381
Photographic Science and Technique (Scientific and Technical Group of the Royal Photographic Society Conference on), 957
Photographic Society, Royal (Scientific and Technical Group): Discussion on Cinematography in Scientific Research, 726
  Conference on Photographic Science and Technique, 957
Photographs, X-Rays and Drawings: A Caliper for Measuring (J. M. Tanner and R. H. Whitehouse), 1180
Photography (Interference), of the Chromospheric Spectrum (Dr. P. J. Treanor), 1166
Photomagnetism of Triplet States of Organic Molecules (Dr. D. F. Evans), 777
Photometric Studies of a Lunar Eclipse, 817
Photonuclear Effect and the Complex Potential-Well Nuclear Model (J. P. Davidson), 649
Photo-reactivation of *Botrytis fabae* Sardiña measured by a Local-lesion Technique (P. T. Last and E. W. Buxton), 655
Photosynthesis: Function of Carotenoids in (Dr. Mary Griffiths, Dr. W. R. Sistrom, Dr. Germaine Cohen-Bazire and Prof. R. Y. Stanier), 1211; (Prof. M. Calvin), 1215
Photosynthesis in Different Phyla (L. Norris, R. E. Norris and Prof. M. Calvin), 432
Photosynthetic Carbon Cycle (Prof. M. Calvin), 586
Photosynthetic Phosphorylation by Chloroplast Fragments: Oxidative and (Takao Ohmura), 467
Phyla: Photosynthesis in Different (L. Norris, R. E. Norris and Prof. M. Calvin), 432
Physical Chemistry at Sheffield, 378
Physical Chemistry in the University of the Witwatersrand, 629
Physical Chemistry: The Relation between Theory and Experiment in (Prof. E. A. Guggenheim), 586
Physical Chemistry of Enzymes (Faraday Society Discussion on), 958
Physical Chemistry of the Silicates (Wilhelm Eitel), *review* by Dr. R. C. Mackenzie, 47
Physical Exercise: Significance of Glutamic Acid in Metabolic Processes in the Rat Brain during (Dr. R. Vrba), 1258
Physical Exertion: A Source of Ammonia and Changes of Protein Structure in the Rat Brain during (Dr. R. Vrba), 117
Physical Measurements in Gas Dynamics and Combustion (edited by R. W. Ladenburg, B. Lewis, R. N. Pease and H. S. Taylor), *review* by Dr. A. G. Gaydon, 1040
Physical Metallurgy: Fundamentals of, *review* by Dr. J. A. Catterall, 229
Physical Society: Guthrie Lecture for 1956 (Sir Francis Simon), 241
  Rutherford Lecture for 1956 (Prof. P. I. Dee), 241
  Duddell Medal for 1956 awarded to Prof. J. G. Gaunt, 241
  Charles Vernon Boys Prize for 1956 awarded to Dr. G. D. Rochester and Dr. C. C. Butler, 241
  Summer Meeting on High-Energy Nuclear Physics, 371
  Report for 1954, 499
  Report of the Conference on the Physics of the Ionosphere, Cambridge, 1954, 731
Physical Society and the Royal Meteorological Society: Conference on Cloud Physics, 770, 1104
Physical and Chemical Laboratories: X-Ray Diffraction in, *review* by Dr. A. Guinier, 710
Physicians of Philadelphia, College of: Alvarenga Prize for 1955 awarded to Dr. C. H. Rammelkamp, 336
Physicist: Education of the (British Association for the Advancement of Science, Section L (Education), Discussion on), 678
Physico Chemical Entity: The Chromosome as a (Prof. C. D. Darlington), 1139
Physics at King's College, London, 285
Physics at Newcastle, 815
Physics in the University of Hull, 1197
Physics at the University College of Rhodesia and Nyasaland, 14
Physics in One Volume, *review* by Prof. G. O. Jones, 184
Physics: Cloud (Physical Society and the Royal Meteorological Society Conference on), 770, 1104
  High-Energy Nuclear (Physical Society's Summer Meeting on), 371
  Niels Bohr and the Development of—Essays dedicated to Niels Bohr on the occasion of his Seventieth Birthday (edited by W. Pauli, with the assistance of L. Rosenfeld and V. Weisskopf), *review* by Prof. W. E. Burcham, 1186
  Nuclear (Prof. Alex E. S. Green), *review* by R. C. Hanna, 1088
  Nuclear (Dr. Irving Kaplan), *review* by R. C. Hanna, 1088
  Solar, *review* by Dr. A. Hunter, 5
  Textbook of (edited by R. Kronig, in collaboration with J. De Boer, H. C. Burger, P. H. Van Cittert, C. J. Gorter, A. C. S. Van Heel, P. Van der Leeden and G. J. Sizoo), translated from the third Dutch edition, *review* by Prof. G. O. Jones, 184
  Theoretical (Division of Pure Physics of the National Research Council of Canada Colloquium on), 588
Physics, Institute of: Conference on the Physics of Nuclear Reactors, 16
  Election of Sir James Chadwick as an Honorary Fellow, 16
  Prominent part played by British physicists in the United Nations Conference on the Peaceful Uses of Atomic Energy to be recorded in the Minutes, 725
  Thirty-fifth Annual Report, 912
Physics, Institute of (Electron Microscopy Group): Conference on the Electron Microscopy of Textile and other Industrial Fibres, 632
Physics, Institute of (Non-Destructive Testing Group): Summer Meeting, 385
Physics, Institute of (Stress Analysis Group): Ninth Annual Conference (Applications of Stress Analysis), 336
Physics, Institute of, and others: First meeting of the British Nuclear Energy Conference, 956
Physics for Medical Students (Dr. J. S. Rogers), third edition, *review* by G. R. Noakes, 185
Physics of Nuclear Reactors (Institute of Physics Conference on), 16
Physics of the Ionosphere (Report of the Physical Society Conference at Cambridge, 1954), 731
*Physics (Applied), British Journal of* (edited by Dr. H. R. Lang), Vol. 5 (1954), and Supplement No. 3, The Physics of Particle Size Analysis, *review*, 1091
Physics (Cosmic Ray): Progress in (edited by Dr. J. G. Wilson), Vol. 2, *review*, 1138
Physics (Experimental): Introduction to (Prof. William B. Fretter), *review* by Prof. H. W. B. Skinner, 942
Physics (Health): Courses in Radiological Physics and (University of Chicago), 493
Physics (Low-Temperature): Progress in (edited by Prof. C. J. Gorter), *review* by Dr. D. Shoenberg, 322
Physics (Modern): The Teaching of, *review* by Prof. H. W. B. Skinner, 942
Physics (Nuclear): Text-Books of, *review* by R. C. Hanna, 1088
Physics (Radiological), and Health Physics: Courses in (University of Chicago), 493
Physics (Reactor), and Chemistry: Peaceful Uses of Atomic Energy—(Dr. J. Gaunt and D. J. Littler), 619
Physiological Genetics of the Garden Pea (D. M. Paton and Prof. H. N. Barber), 1103
Physiological Races of *Puccinia polysora* Underw. (A. K. Ryland and Dr. H. H. Storey), 655
Physiological Society: Monograph No. 2, Man in a Cold Environment (Prof. Alan C. Burton and Prof. Otto G. Edholm), *review* by Dr. J. R. Brown, 849
Physiology in Cold Climates, *review* by Dr. J. R. Brown, 849
Physiology of the Heart of a Scorpion (M. S. Kanungo), 980
Physiology of Insect Metamorphosis (Prof. V. B. Wigglesworth), *review* by Prof. J. F. Danielli, 136
Physiology (Plant): An Introduction to (Dr. W. O. James), fifth edition, *review* by Dr. G. Bond, 481
*Phytophthora infestans* in Canada: Biological Races of (K. M. Graham and H. N. Racicot), 432
Pi-Mesons and Nucleons (Prof. H. A. Bethe), 638

Polar Hydrocarbons, Polar Polymers, Proteins and Polypeptides: Formation of Complexes of Fluorocarbons and Fluorocarbon Derivatives with (H. B. Klevens), 879
Polar Polymers, Proteins and Polypeptides: Formation of Complexes of Fluorocarbons and Fluorocarbon Derivatives with Polar Hydrocarbons, (H. B. Klevens), 879
Polar Substances on Polyamides: Sorption Chromatography of (V. Carelli, A. M. Liquori and A. Mele), 70
Polar Wandering: Geological, Dynamical and Palaeomagnetic Aspects of (Department of Geodesy and Geophysics of the University of Cambridge Colloquium on), 422
Polar (North) Regions: Long-Distance Plant Dispersal in the (Dr. Nicholas Polunin), 22
Polarization (Circular), of Gamma-Rays following Polarized Neutron Capture (Dr. Georg Trumpy), 507
Polarized Neutron Capture: Circular Polarization of Gamma-Rays following (Dr. Georg Trumpy), 507
Polarographic Instrumentation (Polarographic Society Symposium on), 198
Polarographic Conference: Hungarian–Czechoslovak (Prof. J. Heyrovsky), 865
Polarographic Laboratory of the Cambridge Instrument Co., Ltd.: New, 1003
Polarographic Society: Symposium on Polarographic Instrumentation, 198
Polarographic Society in Great Britain: Election of Prof. J. Heyrovsky as president, 539
Polarography: Advanced course on (Royal Technical College, Salford), 725
  New Trends in (Prof. J. Heyrovsky), 865
Polarography in Hungary: Development of (Prof. L. Erdey-Grúz), 866
Policy for Wages, *review* by Dr. N. S. Ross, 183
Polish Academy of Sciences: *Quarterly Review of Publications*, 147
Polish Medal Awards for Scientific Work, 336
*Political Quarterly*: Special number on the Revolt against Reason, 521
Political and Economic Planning: Broadsheet No. 380, Towards the Automatic Factory, 133
  Report on Colonial Students in Britain, 320, 591
  Broadsheet No. 384, Balance Sheet of the Press, 955
  Broadsheets 381 and 382, Standards in British Industry, 1061
Pollard, Dr. P. H.: Sorting Molecules, 1188
Pollard, J.: Design of Electronic Devices for Production, 1060
Pollen: Atmospheric (H. A. Hyde), 546
Pollen-grains and Spores in Coal Deposits of Tertiary Age in West Spitsbergen (Svein Manum), 248
Pollitzer, R.: Plague, *review* by Dr. E. Ashworth Underwood, 615, 957
Pollock, Dr. M. R.: Biochemical and Microbiological Research in Hungary—Some Impressions, 1156
Pollution: Air (Edward Burke), 85; (The Editors), 85
Pollution (Air), in Britain, 335
Pollution (Atmospheric), in Britain, 891; in Great Britain, 955
Polonovski, J. (Robert, L., and): Physical Chemistry of Enzymes, 958
Polson, Dr. A., and Madsen, T. L.: A Brain Factor influencing the Viability of Neurotropic Rift Valley Fever, 645
Polunin, Dr. Nicholas: Long-Distance Plant Dispersal in the North Polar Regions, 22
Poly-L-Proline: Structure of (Pauline M. Cowan and Stewart McGavin), 501
Polya, Dr. J. B.: Inhibition of Cholinesterases by 1 : 2 : 4-Triazoles, 1175
Polyamides: Sorption Chromatography of Polar Substances on (V. Carelli, A. M. Liquori and A. Mele), 70
Polyamine Requirement of *Neisseria perflava* and *Pasteurella tularensis* for Growth in Defined Media: Influence of Osmotic Pressure on the (Dr. J. Mager), 933
Polycrystalline Materials: X-Ray Diffraction by (edited by H. S. Peiser, H. P. Rooksby and Dr. A. J. C. Wilson), *review* by Dr. A. Guinier, 710
Polyethylene Terephthalate (Amorphous): Density of (A. B. Thompson and D. W. Woods), 78
Polygenic inheritance in *Neurospora* (J. A. Pateman), 1274

Polyglutamic Acid : Inhibition, Restoration and Enhancement of Proteolytic Action by Polylysine and (Eva E. Dellert and Dr. Mark A. Stahmann), 1028
Polyglycine : Structure of (Dr. C. H. Bamford, L. Brown, E. M. Cant, Dr. A. Elliott, W. E. Hanby and B. R. Malcolm), 396
Polyglycine II : Structure of (Dr. F. H. C. Crick and Dr. Alexander Rich), 780
Polyhedroses of *Tipula paludosa* (Diptera) : Intranuclear Changes in the (Dr. Kenneth M. Smith), 255
Polyhydric Alcohols : Paper Electrophoresis of (Dr. D. Gross), 362
Polylysine and Polyglutamic Acid : Inhibition, Restoration and Enhancement of Proteolytic Action by (Eva E. Dellert and Dr. Mark A. Stahmann), 1028
Polymer (Ethylene) : Observations of Spiral Growth in (Ralph Jaccodine), 305
Polymer (Old) : New Light on an, *review*, 896
Polymerization (Vinyl) : Termination Reaction in—Preparation of Block Copolymers (Dr. C. H. Bamford and A. D. Jenkins), 78
Polymers (High) : Complex Formation between Montmorillonite and (Dr. W. W. Emerson), 461
Polymers (Polar), Proteins and Polypeptides : Formation of Complexes of Fluorocarbons and Fluorocarbon Derivatives with Polar Hydrocarbons, (H. B. Klevens), 879
Polymers (Synthetic Linear) : Electron Microscopic Observation of Monolayers of (Taro Tachibana, Kiyoshi Inokuchi and Teiko Inokuchi), 1117
Polymethacrylic Acid : Negative Thixotropy of Aqueous Solutions of (J. Eliassaf, A. Silberberg and Prof. A. Katchalsky), 1119
Polymorphic Transition Temperatures : A Projection Instrument to aid in the Determination of Mesomorphic and (Dr. G. W. Gray and A. Ibbotson), 1160
Polymorphism of Glycerides : Infra-Red Spectra and the (Dr. D. Chapman), 216
*Polypeptide Chain Configuration of Collagen* (Dr. Pauline M. Cowan, Dr. Stewart McGavin and Dr. A. C. T. North), 1062
Polypeptides : Formation of Complexes of Fluorocarbons and Fluorocarbon Derivatives with Polar Hydrocarbons, Polar Polymers, Proteins and (H. B. Klevens), 879
Polythene (Irradiated) : Electric Strength of (K. H. Stark and C. G. Garton), 1225
*Pongamia pinnata* (L.) Merr. : New Flavones from—Identification of Compound *D* (S. K. Pavanaram and Dr. L. Ramachandra Row), 1177
Pontecorvo, Prof. G. : Appointed to the chair of genetics in the University of Glasgow, 1101 ; work of, 1101
  Ionizing Radiation and the Cell, 1204
Pool, R. A. H. : Awarded a Fellowship by the British Oxygen Co., Ltd., for postgraduate research in inorganic chemistry, 539
Poole, P., and others : Adsorption of Methylene Blue by High-Silica Sands, 1025
Pope, Dr. C. G., and others : Production of Diphtheria Toxin in Submerged Culture, 1128
Pope, Prof. J. A. : The Education and Training of Graduate Staff for Industrial Research, 141
Pope, M. T. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 770
Popják, Dr. G. : Chemistry, Biochemistry and Isotopic Tracer Technique, 193
Popov, G. B. : Aggregation and Gregarious Behaviour of Locusts, 590
  Estimation of Numbers of Locusts, 590
  The Desert Locust Problem, 591
Population Studies : Relation of Genetics to, 532
Populations of Wild House Mice : Widespread Distribution of Mutant Alleles (t-Alleles) in (Prof. L. C. Dunn), 1275
Populations (Animal) : Natural Control of, *review* by C. S. Elton, 419
Populations (Insect) : Interaction of Spray Programmes and, 902
Populations (Pacific) : Maximum Likelihood Calculation of *Rh* Gene Frequencies in (Prof. William C. Boyd), 648
Porphyria (Congenital), in Swine and Cattle in Denmark (S. K. Jørgensen and Dr. Torben K. With), 156
Portal Vein of Adult Mammals (Rodents): Demonstration *in vivo* and *in vitro* of Peristaltic Contractions in the (Prof. G. Attardi), 76
Porte, A. L., and Robertson, Prof. J. Monteath : *Configurations of Tiglic and Angelic Acids—an X-Ray Determination*, 1116
Porter, Prof. A. : Appointed to the chair of light electrical engineering in the Imperial College of Science and Technology, 13 ; work of, 13
Porter, Dr. George : Appointed to the chair of physical chemistry in the University of Sheffield, 101, 378 ; work of, 378
  Advances in Molecular Spectroscopy, 682
Porter, H. K., and May, L. H. : Metabolism of Radioactive Sugars, 107
Porter, Dr. J. G. : *Obituary* of Dr. E. J. Delporte, 1052
Porter, R. V. H. : Appointed conservator of forests, Kenya, 539
Positive-Point D.C. Corona (Dr. B. Murphy), 397
Posner, A. M. (Gorsuch, T. T., and) : Colorimetric Determination of Micro Quantities of Calcium, 268
Post Office : Appointment of Sir Gordon Radley as director-general, 102
*Post-War Decade : The Growth of Aeronautical Research in Canada during the* (Dr. J. J. Green), 493
Postgraduate Awards in British Commonwealth Universities (Association of Universities of the British Commonwealth), 1199
Postgraduate Course in Coal Preparation (University of Birmingham), 15
Postgraduate Medical School : Title of professor emeritus in the University of London conferred on Prof. J. H. Dible, 194
Postgraduate Research Scholarships (Courtaulds' Scientific and Educational Trust Fund Awards for 1955), 770
Postgraduate Scholarships in Husbandry (Department of Agriculture for Scotland Awards), 677
Potassium : Interactions of Nitrogen, Phosphorus and, on Sugar-Beet (G. N. Thorne), 344
Potassium Concentrations in the Red Blood Cells of Sheep : Genetic Control of Sodium and (J. V. Evans and J. W. B. King), 171
Potassium Ethyl 1-Methoxypicrate : Visible Spectrum of, and of related Compounds (R. Foster), 746
Potassium Glycerophosphate : Preservation of Rat Liver Nuclei by (J. St. L. Philpot and J. E. Stanier), 1128
*Potassium—Argon, Ages of some* Lewisian and Fennoscandian Pegmatites (Prof. Arthur Holmes, Dr. H. A. Shillibeer and Prof. J. T. Wilson), 390
Potato : Crystalline Inhibitors of Trypsin from (Prof. Kamala Sohonie and K. S. Ambe), 972
Potato Proteins : Effect of 2,4-Dichlorphenoxyacetic Acid and Maleic Hydrazide on, as shown by Paper Electrophoresis (Grace K. Yasuda, Merle G. Payne and Jess L. Fults), 1029
Potato Virus Y : Reactions to (J. Munro), 631
Potato (Sweet), infected with Black Rot : Respiratory Increase and Phosphorus and Nitrogen Metabolism in (Takashi Akazawa and Dr. Ikuzo Uritani), 1171
Potential (After-) : Modification of the, of Single Muscle Fibres by 2 : 4-Dinitrophenol (Prof. W. V. Macfarlane and J. D. Meares), 403
Potential (End-plate) : Quantal Nature of the (Dr. J. del Castillo), 650
Potential (*Retarding*) : *Measurements of*, on the Hollow Cathode (Dr. A. W. Bright and J. S. Thorp), 1079
Potential Gradients (Very High) : Paper Electrophoresis of Amino-Acids and Oligopeptides at (Dr. D. Gross), 72
Potential-Well Nuclear Model : *The Photonuclear Effect and the Complex* (J. P. Davidson), 649
Potter, Dr. A. Lloyd : Use and Abuse of Protective Equipment, 1252
Potter, Dr. E. C. : Awarded the second Prize of the *Research* section of the *Sunday Times* and *Research* Essay Competition for 1955 on Science in Industry, 862
Potts, Dr. W. T. W. : Appointed lecturer in zoology at the University of Birmingham, 862
Poulik, M. D., and Pinteric, L. : An Electronic Computer for the Evaluation of Results of Filter-Paper Electrophoresis, 1226
Power, Dr. W. F. : Use of Radioactive Materials in Biological Assay, 428
Powder Patterns : Standard X-Ray Diffraction (National Bureau of Standards, Washington, Circular No. 539), 147
Powdered Salts : Charge acquired by, on moving over Metal Surfaces (Dr. B. A. Cooke), 264
Powders : A Method of Determining *Particle Size of* (M. L. Lakhanpal, V. D. Anand and Dr. B. R. Puri), 692
Powell, H. M. : Sorting Molecules, 1188
Powell, T. P. S. (Cowan, W. M., and) : Use of the Glees Silver Technique in the Hypothalamus, 1124
Power (Human) : New Records in (Dr. P.-O. Åstrand), 922
Power Measurements : Audio-Frequency (National Physical Laboratory, Notes on Applied Science No. 8), 492
Poynter, D. : Importance of Larval Characters in Classification, 912
Practice : Combustion in Theory and (T. F. Hurley), 1239
Practice of Neutron Diffraction : Theory and, *review* by Dr. H. P. Rooksby, 895
*Practitioner* : Vol. 174, No. 1042, The Handicapped Child, 389
  November issue, The Value and Dangers of Cortisone and Corticotrophin, 956
Pramer, D. (Crowdy, S. H., and) : *Evidence of Translocated Antibiotics in* Expressed Plant Sap, 335
Pratt, Margaret I., and others : Macromolecular Weight and Size of Deoxypentose Nucleic Acids, 161
Pratt, M. W. T. (Gray, Dr. Peter, and) : Chemiluminescence in the Decomposition of the Propyl Nitrates, 1171
Pre-Breakdown Ionization Currents in Hydrogen : Growth of (Dr. R. W. Crompton, Dr. J. Dutton and Dr. S. C. Haydon), 1079
Precipitating Antibodies in Young Rabbits : Inhibition of the Production of (A. E. R. Downe), 740
Predation Pressure and Evolution in Lake Nyasa (G. Fryer and T. D. Iles), 470
Premaswarup, D. : Awarded an overseas scholarship for 1955 by the Royal Commission for the Exhibition of 1851, 58
Preparation of Cell Suspensions from Plant Roots for Cytological Studies (Shirley Hornsey), 744
Prescott, David M. (Møller, Knud Max, and) : Spectroscopic Observations on Commercial Preparations of Cytochrome c, 1121
Preservation of Food : Scientific and Technological Problems involved in using Ionizing Radiations for the (Dr. R. S. Hannan), 731
Preservation of Rural England, Council for the : Twenty-ninth Annual Report (1954–55), 816
Preservation of the Sheld-Duck in Germany, 769
Preservatives (Wood), used for Pressure Treatment : Field Tests on (D. N. Smith), (Forest Products Research, Bulletin No. 32), 248
Press : Balance Sheet of the (Political and Economic Planning, Broadsheet No. 384), 955
Press in Great Britain : Economics of the, 955
Pressure : Production of Anisotropy in a Permanent Magnet by (J. E. Gould and M. McCaig), 977
Pressure with the Mercury Barometer : *Measurement of* (National Physical Laboratory, Notes on Applied Science No. 9), 193
Pressure Treatment : Field Tests on Wood Preservatives used for (D. N. Smith) (Forest Products Research, Bulletin No. 32), 248
Pressure (High-) Glow-to-Arc Transitions with Tungsten and Copper Cathodes (W. L. Price, W. A. Gambling and Dr. H. Edels), 28
Pressures (High) : A New Method for the Absolute Measurement of (R. S. Dadson), 188
Prest, A. R., assisted by Adams, A. A. : Consumers' Expenditure in the United Kingdom, 1900–1919, *review*, 4
Preston, J. S. : Methods Used for the Absolute Standardization of Light Meters, 769
Preston, Dr. N. W., and Sherris, Dr. J. G. : Factors Influencing the Motility of a Strain of *Pseudomonas viscosa*, 1220
Preston, Prof. R. D., and others : Electron Microscopic Observations on the Structure of the *Sieve Plates in Cucurbita*, 868
Preston, Prof. R. D. (Balashov, V., and) : Fine Structure of Cellulose and other Microfibrillar Substances, 64
Preston, R. L., and Hogg, Dr. B. G. : Radioactive Fall-out in Kingston, Canada, 459
Prevention of Tuberculosis, National Association for the : Fourth Commonwealth Health and Tuberculosis Conference, 245
Price, Dr. Derek J. (edited from Peterhouse MS. 75, I, by): The Equatorie of the Planets (with a Linguistic Analysis by R. M. Wilson), *review* by Sir Harold Spencer Jones, 415
Price, M. Philips : Dissemination of Science, 1008

Price, Dr. W. C. : Title of professor of physics in the University of London conferred on, 194, 285 ; work of, 285
  Advances in Molecular Spectroscopy, 682
Price, W. L., and others . High-Pressure Glow-to-Arc Transitions with Tungsten and Copper Cathodes, 28
Priestley, Sir Raymond . Elected president of the British Association for the Advancement of Science, 490
  Temporarily appointed director of the Falkland Islands Dependencies Scientific Bureau, 910
Primates other than Man : Supra-Sternal Ossicles in (Prof. D. V. Davies), 1130
  Supra-sternal Ossicles in—some Isolated Cases in Gorilla and Chimpanzee (Dr. G. T. Ashley), 608
Primates (Early) · A New Family of, 500
Prime Mover ? . Is the Gene a (Prof. Carl C. Lindegren), 1244
Primo, Dr. C. Algal Chemistry, 1107
Prince, A. : Reactivity of Freshly Formed Steel Surfaces, 223
Principles of Analytical Inorganic Chemistry, *review* by Dr. Albert Wassermann, 1137
Principles of Biochemistry (Prof. Abraham White, Prof. Philip Handler, Prof. Emil L. Smith and Dr. DeWitt Stetten), *review* by Prof. D. C. Harrison, 276
Principles of Gas Refrigerating Machines (Dr. J. W. L. Kohler), 623
Principles of Organic Chemistry . Theoretical (Prof. Walter Huckel), Vol. I (translated from the corrected seventh German edition by Prof. F. H. Rathmann), *review* by Dr. P. B. D. de la Mare, 991
Principles of Systematic Zoology : Methods and (Ernst Mayr, Prof. E. Gorton Linsley and Prof. Robert L. Usinger), *review* by Dr. H. W. Parker, 711
Printz, H. : Botany of Seaweed, 1107
Pritchard, Tom (Bradshaw, A. D., and) Ecology of Snowdonia—Wild White Clover in Natural Mountain Grassland, 596
Probability Distribution · Approximate Joint, for Wave Amplitude and Frequency in Random Noise (R. A. Wooding), 564
Problem of Criteria Evaluation of Methods in Applied Psychology and the (Symposium at the Twelfth International Congress of Applied Psychology), 449
Problem of Race, *review* by Prof. T. S. Simey, 416
Problem of Rewarding Responsibility (G. R. Moxon and H. J. Perkin), 545
Procedures for Genetic Studies of Yeasts : New Materials and (Dr. Lynferd J. Wickerham), 22
Process Industries . Automatic Control in the (Institution of Chemical Engineers and the Society of Instrument Technology Conference on), 241
Production · Design of Electronic Devices for (Summer School at the Services Electronics Research Laboratories), 1059
Production of Anisotropy in a Permanent Magnet by Pressure (J. E. Gould and M. McCaig), 977
Production of Diphtheria Toxin in Submerged Culture (F. V. Linggood, A. C. Matthews, S. Pinfield, Dr. C. G. Pope and T. R. Sharland), 1128
Production of 'O Inagglutinability' in Erythrocytes coated with Typhoid Vi and O Antigens (Dr. Maurice Landy and Ruggero Cappellini), 1266
Production of Precipitating Antibodies in Young Rabbits : Inhibition of the (A. E. R. Downe), 740
Production and Measurement of Ultra-High Vacua (Dr. J. A. Becker), 452
Production (Jute), and Research, 344
Production Engineers, Institution of : Conference on Automation, 133
Products of Nuclear Explosions : Genetical Effects of Radiation from (Prof. J. B. S. Haldane), 115 ; (Sir John Cockcroft), 115
Professional Engineers Appointments Bureau . Engineering Appointments in Great Britain during 1954, 288
*Progresso Terapeutico*, a New Italian Medical Review, 148
Projection Instrument to aid in the Determination of Mesomorphic and Polymorphic Transition Temperatures (Dr. G. W. Gray and A. Ibbotson), 1160
Promotion of Field Studies, Council for the . Summer Courses, 15
Promotion of Field Studies, Council for the (Royal Meteorological Society and the) : Vacation Courses in Synoptic Meteorology, 1248
Promotion of Health, Royal Society for the · New name of the former Royal Sanitary Institute, 241
Properties of S-Alanyl Coenzyme A · Synthesis and (Charles J. Stewart and Prof. Theodor Wieland), 316
Properties of a Collagen soluble in Salt Solution at Neutral *p*H : Isolation and (D. S. Jackson and J. H. Fessler), 69
Properties of Degraded Gelatins : Mechanical (P. R. Saunders and A. G. Ward), 26
Properties of Fluids : Applications of Spectroscopy to Chemical Problems and on Intermolecular Forces and the (Summer School at the University of Cambridge), 1104
Properties of Leather (Symposium at the Fourth Conference of the International Union of Leather Chemists' Societies), 587
Properties of Metals . Mechanical, *review* by Dr. K. M. Entwistle, 571
Properties of Thin Films : Electric and Magnetic, *review* by Prof. L. F. Bates, 416
Properties (Strength), of Plywood (W. T. Curry), Part 2, Effect of the Geometry of Construction (Forest Products Research, Bulletin No. 33), 248
Properties (Swelling), of the Chloroplasts of *Nitella cristata* : Structure and (F. V. Mercer, A. J. Hodge, A. B. Hope and J. D. McLean), 389
Propionate (Copper Acetate and) : Direct Interaction between Copper Ions in the Molecules of (Ryutaro Tsuchida and Shoichiro Yamada), 1171
Propionic Acid in Animal Tissues · Metabolism of (Dr. Martin Flavin, Priscilla L. Ortiz and Prof. Severo Ochoa), 823
Propriétés magnétiques des lames métalliques minces (Prof. M. A. Colombani), *review* by Prof. L. F. Bates, 416
Proprioceptor in the Body Musculature of Lepidoptera (L. H. Finlayson and Prof. Otto Lowenstein), 1031
Propyl Nitrates : Chemiluminescence in the Decomposition of the (Dr. Peter Gray and M. W. T. Pratt), 1171
Prosen, Richard J., and others : Structure of Vitamin $B_{12}$—The Crystal Structure of the Hexacarboxylic Acid derived from $B_{12}$ and the Molecular Structure of the Vitamin, 325
Proskurnin, M. : Chemical Effects of Ionizing Radiation, 197
Protection of Deoxyribonuclease from Ionizing Radiation by Adsorbents (G. L. Fletcher and S. Okada), 882
Protection against Ionizing Radiations (Dr. E. H. Belcher), 375
Protection against Radiations from Radium, Cobalt-60 and Caesium-137 (United States National Bureau of Standards, Handbook 54), 769
Protective Action of Vitamin $B_{12}$ in the Hyperthyroid Rat (Dr. Prema Fatterpaker, Urmila Marfatia and Prof. A. Sreenivasan), 165
Protective Equipment : The Use and Abuse of (British Occupational Hygiene Society Conference on), 448, 1251
Protein (Southern Bean Mosaic Virus) : Molecular Arrangement in Crystals of the (Dr. Louis W. Labaw and Dr. Ralph W. G. Wyckoff), 455
Protein (Tail), of Bacteriophage $T_2r^+$ . Action of Complexes of the Zinc Group Metals on the (L. M. Kozloff and K. Henderson), 1169
Protein Electrophoresis Accuracy and Reproducibility of Paper (R. A. Neely and D. W. Neill), 33
Protein Factors (Animal), of Casein : Relationship between Orotic Acid and (R. Viviani, M. Marchetti, A. Rabbi and Prof. G. Moruzzi), 464
Protein Structure in the Rat Brain during Physical Exertion A Source of Ammonia and Changes of (Dr. R. Vrba), 117
Protein Synthesis in Isolated Cell Nuclei (Dr. V. G. Allfrey, Dr. A. E. Mirsky and Syozo Osawa), 1042
Proteins The—Chemistry, Biological Activity and Methods (edited by Hans Neurath and Kenneth Bailey), Vol. 2, Part B, *review* by N. W. Pirie, 181
  Transfer of, from the Yolk to the Chick Embryo (A. M. Schechtman and Patricia F. Knight), 786
Proteins Encompassed, *review* by N. W. Pirie, 181
Proteins (Component), of a Deoxyribonucleoprotein · Characterization and Total Recovery of the (Dr. G. Toennies and B. Bakay), 696
Proteins (Fibrous) : Side-Chain Orientation in (Dr. R. D. B. Fraser), 358
Proteins (Potato) : Effect of 2,4-Dichlorphenoxyacetic Acid and Maleic Hydrazide on, as shown by Paper Electrophoresis (Grace K. Yasuda, Merle G. Payne and Jess L. Fults), 1029
Proteins (Serum), in Normal Humans . Genetic Control of some (Dr. O. Smithies and Dr. Norma Ford Walker), 1265
Proteins and Polypeptides . Formation of Complexes of Fluorocarbons and Fluorocarbon Derivatives with Polar Hydrocarbons, Polar Polymers, (H. B. Klevens), 879
Proteolytic Action : Inhibition, Restoration and Enhancement of, by Polylysine and Polyglutamic Acid (Eva E. Dellert and Dr. Mark A. Stahmann), 1028
Proton : The Negative, or Anti-proton (Announcement by the University of California and the United States Atomic Energy Commission of the detection of), 860
Protoplasmic Streaming : Auxin and (J. M. Kelso and J. S. Turner), 732
Protoplasts in 'Mature' Wood Elements (Prof. A. J. Eames and Prof. L. H. MacDaniels), 39
Protozoa : The Contractile Vacuole of Parazoa and, and the Golgi Apparatus (Prof. J. Bronte Gatenby, and Dr. A. J. Dalton and Dr. M. D. Felix), 301
Pryce, Prof. M. H. L. : Nuclear Spectroscopy, *review*, 414
Pryor, Dr. A. W., and Richardson, Dr. E. G. : Visco-elastic Behaviour, 62
Pseudocholinesterase in the Tissues of Ruminants Identification of (Prof. B. Mendel and Dr. D. K. Myers), 783
*Pseudomonas aeruginosa* Auxotrophic Mutants of (J. S. Loutit), 74
*Pseudomonas viscosa* · Factors Influencing the Motility of a Strain of (Dr. N. W. Preston and Dr. J. C. Sherris), 1220
Pseudophyllidean Cestode, *Eubothrium crassum* (Bloch) · Maturation Divisions of the Ova in the (Dilys Rawson), 167
Pseudorabies Virus : Interference between Variants of, demonstrable in Tissue Culture (Dr. George Ivanóvics, Helena Báldi and Ervin Szollósy), 972
Psychologique · l'Année (rédacteurs Henri Piéron, Alfred Fessard et Paul Fraisse), cinquante-quatrième année, 1954, *review* by Prof. John Cohen, 230
Psychology : A Survey of Current, *review* by Prof. John Cohen, 230
Psychology (Applied) : Evaluation of Methods in, and the Problem of Criteria (Symposium at the Twelfth International Congress of Applied Psychology), 449
  Twelfth International Congress of (Alec Rodger), 449
Psychology and the Film (British Universities Film Council Conference on), 1109
Pteridophyta (Ceylon) Cytology and Taxonomy of (I. Manton and W. A. Sledge), 631
*Pteropus* Relationships between the Flying Fox Genus, and Arthropod-borne Fevers of North Queensland (J. L. O'Connor, L. C. Rowan and J. J. Lawrence), 472
Public Health Food Microbiology and (Society for Applied Bacteriology Symposium on), 373
Public Relations for the Chemical Profession (American Chemical Society News Service brochure), 908
*Publications, Quarterly Review of* (Polish Academy of Sciences), 147
*Puccinia polysora* Underw. . Physiological Races of (A. K. Ryland and Dr. H. H. Storey), 655
Pugh, Dr. L. G. C. E. . Pulmonary Circulation and Respiratory Function, 961
Pugh, Prof. L. P. Veterinary Studies at Cambridge, 806
Pulmonary Circulation and Respiratory Function (Symposium at Queen's College, Dundee), 960
Pulp (Groundwood) : Inactivation of Phenyl Mercuric Acetate in, by a Mercury-resistant Strain of *Penicillium roqueforti* Thom (P. Russell), 1123
Punched Cards · Documentation of Spectra by (Butterworths Scientific Publications and Verlag Chemie), 724
Pure Mono-, Di- and Tri-glycerides : A Simplified Method of preparing (L. Hartman), 1024
Pure Science : Engineering and, 821
Pure and Applied Chemistry : Fourteenth International Congress of (Advances in Organic Chemistry), 58, 759
Pure and Applied Chemistry, International Union of . Eighteenth Conference, 58
  Approval of the recommendation of the Commission on Nomenclature in Inorganic Chemistry that Element 101 be named Mendelevium, symbol Mv, 586
Puri, Dr. B. R., and others . A Method of Determining Particle Size of Powders, 692
Purification of Brackish Water : International Co-operation on, 286

Purines and Pyrimidines: A Reagent for the Detection of Chloride and of certain, on Paper Chromatograms (T. Wood), 175
Purpose in Education, *review* by T. H. Hawkins, 1087
Purpose of University Education, 707
Purseglove, J. W.: Mr. H. N. Ridley's Hundredth Birthday, 1092
Purves, P. E. (Fraser, F. C., and): The 'Blow' of Whales, 1221
Putrefaction of Cattle Hides and Goatskins: The Effect of certain Drying-Conditions on the (Dr. M. H. French and Dr. R. L. Sykes), 297, 725
Putt, Eric D., and Sackston, Dr. W. E.: Rust Resistance in Sunflowers (*Helianthus annuus* L.), 77
Pyridinium (n-Alkyl), and n-Alkyl Trimethyl Ammonium Halides: Separation within the Homologous Series of n-Alkyl Sulphates, by Paper Chromatography (H. Holness and W. R. Stone), 604
Pyrimidines; A Reagent for the Detection of Chloride and of certain Purines and, on Paper Chromatograms (T. Wood), 175
Pyrolysis (Unimolecular), of Alkyl Halides in the Gaseous Phase: A Correlation between the Rates of, and $S_N1$ Rates in Solution (Dr. Allan Maccoll and Dr. P. J. Thomas), 392
Pyrones (Naturally Occurring): Chemistry of (University College, Dublin, and the Institute of Chemistry of Ireland, Symposium on), 637

QAYUM, Abdul, and others: Anomalies in the Cosmic-Ray Shower Curves for Lead, 876
Quaker Oats, Ltd.: Grant of £1,500 a year for three years to the Department of Pharmacology in the University of Birmingham for research into the chemistry and nutritional value of cereals, 15
Qualitative Analysis on the Small Scale: Elementary (Dr. Peter Woodward), *review* by G. Fowles, 481
Quantal Nature of the End-plate Potential (Dr. J. del Castillo), 650
Quantitative Paper Chromatography of Sugars: Use of Acid-Base Indicator for (K. J. Gardner), 929
Quantitative Separation of B Vitamins by Electrophoresis on Agar Plates (Dr. G. Marten), 1064
Quantum Theory of Solids (Prof. R. E. Peierls), *review* by Prof. H. Frölich, 479
Quarrington, J. E. (Roberts, V., and): Intermetallic Semiconductors, 342
*Quarterly Review of Publications* (Polish Academy of Sciences), 147
Quartermaster Food and Container Institute, Chicago: Report on Color in Foods, 491
Quartz Inclusions: Radioactivity in (Prof. H. E. Huntley), 1229
Queen, H.M. the: To open the new buildings of the School of Veterinary Medicine, University of Cambridge, 381
Queen Mary College, London: Appointment of Dr. K. W. Sykes to the University of London chair of physical chemistry, 1248
Queen Mother, H.M. the: Reading Technical College opened by, 961
Queen Victoria Museum and Art Gallery, Launceston: Annual Report for 1953–54, 676
Queen's College, Dundee: Symposium on Pulmonary Circulation and Respiratory Function, 960
Queen's University, Belfast: Grant of 21,000 dollars from the Rockefeller Foundation for the purchase of research equipment in the Department of Microbiology, 57
  Grant of £300 for three years from Imperial Chemical Industries, Ltd., to support work on heterogeneous catalysis, 57
  Grant of £300 a year under covenant from Gallaher, Ltd., to support work in the Department of Chemistry, 57
  Grant of £285 a year from the Aliphatic Research Co., Ltd., for a research studentship in organic chemistry, 57
  Grant of £580 from the Royal Society to support research in mathematics, 57
  Appointment of Robert E. H. Reid to a lectureship in geology, 57
  Virus Studies in the, 675
  Appointment of Dr. R. J. Magee as lecturer in inorganic chemistry, 1104
  Appointment of Dr. M. F. Grundon as lecturer in organic chemistry, 1104
  Appointment of J. M. Gilchrist and Dr. W. F. K. Kerr as lecturers in mechanical engineering, 1104
  Appointment of J. M. W. McBride as lecturer in light electrical engineering, 1104
  Appointment of Dr. D. S. McIlhagger as lecturer in electrical engineering, 1104
  Grants to the Department of Applied Mathematics from H.M. Treasury of £2,250 for a rocket research project and £1,200 in connexion with the International Geophysical Year, 1104
  Grant to the Department of Organic Chemistry from the Medical Research Council of £500 a year for work on branched-chain carbohydrates, and from the British Empire Cancer Campaign of £450 a year for work on the synthesis of colchicine, 1104
Queensland: Stillwellite, a New Rare-Earth Mineral from (Dr. J. McAndrew and Dr. T. R. Scott), 509
Queensland (North): Relationships between the Flying Fox (Genus *Pteropus*) and Arthropod-borne Fevers of (J. L. O'Connor, L. C. Rowan and J. J. Lawrence), 472
Quercetin Glucosiduronic Acid from the French Bean (C. A. Marsh), 176

RAACKE, Dr. Ilse Dorothea, and others: Amino-Acid Sequence of Alpha-Corticotropin, 687
Raadts, Dr. Edith: Plant Growth Substances, 530
Raats, Emile, and others: Anisotropy of Effective Gas Diffusion Coefficients in Extruded Carbon Rods, 1167
Rabbi, A., and others: Relationship between Orotic Acid and Animal Protein Factors of Casein, 464
Rabbits (Rock): Microfilaraemia in (Dr. A. Smith), 38
Rabbits (Young): Inhibition of the Production of Precipitating Antibodies in (A. E. R. Downe), 740
Race: The Problem of, *review* by Prof. T. S. Simey, 416
Race Relations in South Africa: Education and (Dr. T. B. Davie), 613
Race Relations, South African Institute of: Eleventh Hoernlé Memorial Lecture (Dr. T. B. Davie), 613
Racial Relations: The Colour Problem, a Study of (Anthony H. Richmond), *review* by Prof. T. S. Simey, 416
Racial Tension: An Essay on (Philip Mason), *review* by Prof. T. S. Simey, 416
Racicot, H. N. (Graham, K. M., and): Biological Races of *Phytophthora infestans* in Canada, 432
Radar and Phosphorescence at Sea (Capt. Brett Hilder), 174
Radcliffe-Brown, Prof. A. R.: *Obituary* by Dr. J. G. Peristiany, 1149
Radford, Dr. W. H.: Radio Communication by Wave Scattering, 199
Radiation from Products of Nuclear Explosions: Genetical Effects of (Prof. J. B. S. Haldane), 115; (Sir John Cockcroft), 115
Radiation (Ionizing): Chemical Effects of (Société de Chimie Physique Fifth Annual Meeting), 197
  Effect of, on Haemoglobin and Cytochrome *c* (Dr. H. Laser), 361
  Protection of Deoxyribonuclease from, by Adsorbents (G. L. Fletcher and S. Okada), 882
Radiation (Ionizing), and the Cell (Prof. G. Pontecorvo), 1204
Radiation (Radio Frequency), from the Rosette Nebula (H. C. Ko and Prof. J. D. Kraus), 221
Radiation (Solar): Observations of the, during the Eclipse of the Sun on June 30, 1954 (R. Dogniaux), 1103
Radiation Chemistry of Solutions (M. Ebert and P. Howard-Flanders), 197
Radiation Damage in Metals (Metal Physics Committee of the Institute of Metals Discussion on), 1147
Radiation Patterns: Visual Recording of (Prof. W. V. Mayneord), 14
Radiation Sensitivity of Ovarian Tissue at −79° C. (Dr. A. S. Parkes), 1216
Radiation-catalysed Reactions: Tetrazolium Salts as Viability Indicators—(Johnson Parker), 647
Radiations from Radium, Cobalt-60 and Caesium-137: Protection against (United States National Bureau of Standards, Handbook 54), 769
Radiations (Ionizing): Protection against (Dr. E. H. Belcher), 375
  Scientific and Technological Problems involved in using, for the Preservation of Food (Dr. R. S. Hannan), 731
Radiative Balance in the Atmosphere (Royal Society Discussion on), 635
Radical (Stable Free): Reduction of Riboflavin to a, using X-Rays (Dr. A. J. Swallow), 793
Radical Addition: Molecular Orbital Theory of the Relative Reactivities of Substituted Aromatic Molecules towards (H. H. Greenwood), 1024
Radicals (Labile Photochemical Free): Detection of, by Paramagnetic Resonance (D. J. E. Ingram, W. G. Hodgson, C. A. Parker and W. T. Rees), 1227
Radio-Astronomy at Cambridge, 286
Radio Astronomy: International Research in (Dr. R. L. Smith-Rose), 1110
Radio Brightness on the Solar Disk: The Distribution of (International Scientific Radio Union, Special Report No. 4), 1110
Radio Communication by Wave Scattering, 199
Radio Engineering: Abstracts of Papers on (British Institution of Radio Engineers), 381
Radio Engineers, British Institution of: Abstracts of Papers which have appeared in the *Journal of the British Institution of Radio Engineers* over the past 15 Years, 381
  Premium Awards for 1954, 536
Radio Industry Council: Premiums for articles on Radio, Television and Electronics, 1153
Radio Isotope Instrumentation and Accessories (Dr. D. Taylor and A. G. Peacock), 1102
Radio Noise: Discrete Sources of Extra-Terrestrial (International Scientific Radio Union, Special Report No. 3), 1110
  Location on Jupiter of a Source of (C. A. Shain), 836
Radio Signals (Medium-Wave): Long-Period Fading in (M. Srirama Rao and Dr. B. Ramachandra Rao), 459
Radio Source at 242 Megacycles per Second: A Fluctuating Celestial (Prof. J. D. Kraus, H. C. Ko and D. V. Stoutenburg), 304
Radio Star: Lunar Occultation of a, and the Derivation of an Upper Limit for the Density of the Lunar Atmosphere (B. Elsmore and G. R. Whitfield), 457
Radio Techniques in Meteor Astronomy, *review* by Dr. J. S. Hey, 135
Radio, Television and Electronics (Radio Industry Council premiums for articles on), 1153
Radioactivation Analysis of Phosphorus in Silicon (J. A. James and D. H. Richards), 1026
Radioactive Caesium for Cancer Treatment: Use of, 379
Radioactive Fall-out in Kingston, Canada (R. L. Preston and Dr. B. G. Hogg), 459
Radioactive Isotopes: Instrumentation and Accessories for, 1102
  Protection from, 769
Radioactive Materials in Biological Assay: Use of (Society for Analytical Chemistry, the Royal Institute of Chemistry, the Society of Chemical Industry and the Chemical Society Symposium on), 427
Radioactive Silver, $^{111}_{47}$Ag: Nuclear Spin and Hyperfine Structure of (G. K. Woodgate and R. W. Hellwarth), 395
Radioactive Sugars: Metabolism of (H. K. Porter and L. H. May), 107
Radioactivity in Quartz Inclusions (Prof. H. E. Huntley), 1229
Radioactivity of Zircons (L. H. Ford and C. D. Ollier), 834
Radiobiology, *review* by Dr. J. F. Loutit, 230
  Fundamentals of (Prof. Z. M. Bacq and Dr. P. Alexander), *review* by Dr. J. F. Loutit, 230
  Progress in—Conference at Cambridge (Dr. M. Ebert and A. Howard), 683
Radiocarbon in Tobacco Mosaic Virus: Distribution of (Miss G. Wustinger, H. Schönfellinger and Prof. E. Broda), 306
Radiocarbon Dating—Conference in Cambridge (Dr. Hilde Levi), 727
Radio-Frequency Radiation from the Rosette Nebula (H. C. Ko and Prof. J. D. Kraus), 221
Radio-frequency Spectroscopy: Microwave and (Faraday Society Discussion on), 18
Radioisotopes (British-produced): Prices of, 334
Radioisotopes in Chemistry, Technology and Industry: Peaceful Uses of Atomic Energy— (Dr. Henry Seligman), 854
Radiological Physics and Health Physics: Courses in (University of Chicago), 493
Radiological Protection, International Commission on: Recommendations of the (revised December 1954), 375

Radiology, British Institute of : Annual Congress and Exhibition, 1056
*Radiology, British Journal of*, Supplement No. 6, Recommendations of the International Commission on Radiological Protection (revised December 1954), 375
Radiolyses of Liquid *n*-Hexane and Solutions of Anthracene in *n*-Hexane (Dr. F. H. Krenz), 1113
Radium, Cobalt-60 and Caesium-137 : Protection against Radiations from (United States National Bureau of Standards, Handbook 54), 769
Radivojevitch, D. V. (Martinovitch, Dr P. M., and) : Long-term Transplants of Infantile Rat Pituitaries cultivated *in vitro* and Grafted into the Anterior Eye Chamber of Young Cats, 699
Radley, Sir Gordon : Appointed director-general of the Post Office, 102
Radt, F. (edited by) : Elsevier's Encyclopaedia of Organic Chemistry, Series 3, Carboisocyclic Condensed Compounds, Vol. 12B, Naphthalene (A) Compounds containing One Naphthalene Nucleus—Oxo-Derivatives of the Naphthoic Acids ; Vol. 14, Supplement, Nor-Steroids, Steroids—Hydrocarbons, Halogen, Nitrogen and Unsubstituted Monohydroxyl Compounds (edited by A. Georg with the assistance of M. Georg-Plant), *review* by Dr. J. W. Cook, 523
Raeber, J. G., and Bolton, A. : A New Form of Male Sterility in *Nicotiana tabacum* L., 314
Railways (British) : Science and (T. M. Herbert), 20
Rain : Removal of Mineral Nutrients from Tree Crowns by (G. M. Will), 1180
Rainey, Dr. R. C. : Aggregation and Gregarious Behaviour of Locusts, 590
    Distribution and Movements of Populations of Locusts, 590
    Estimation of Numbers of Locusts, 590
    The Desert Locust Problem, 591
Rainey, Dr. R. C., and others : Migration, 772
Rainfall and Biennial Bearing in Tung (*Aleurites montana*), (D. H. Laycock and L. J. Foster), 654
Rajagopalan, R. (Raju, N. V., and) : Nutritive Value of Heated Vegetable Oils, 513
Rajewsky, B. : Problems of International Concern in the Biological Sciences, 242
Rajewsky, B. (Pauly, H., and) : Progress in Radiobiology, 683
Raju N. V., and Rajagopalan, R. : Nutritive Value of Heated Vegetable Oils, 513
Ramachandran, Prof. G. N., and Kartha, Dr. Gopinath : Structure of Collagen, 593
Ramachandran, Prof. G. N., and others : Occurrence of Chitin in the Epicuticle of an Arachnid *Palamneus swammerdami*, 557
Ramachandran, L. K., and McConnell, W. B. : Syntheses of (L) α-2,4-Dinitrophenylhistidine, 931
Rammelkamp, Dr. C. H. : Awarded the Alvarenga Prize for 1955 by the College of Physicians of Philadelphia, 336
Ramnacin, a New Antibiotic from a *Streptomyces* sp. (Dr. K. Ahmad and M. F. Islam), 646
Ramsay Memorial Fellowships : Awards for 1955–56, 336
Ramsbottom, Dr. J. : Fungi in Forests, 672
Ramsden, F. (Miller, A. A., and) : Food Microbiology and Public Health, 374
*Rana pipiens* Tadpoles : Deoxyribonucleic Acid Content of Nuclei in Tail Mesenchyme of (Jerome J. Freed and Elizabeth Ufford Green), 116
*Rana tigrina* Daud : Venous System of (Surendra Sharma and P. N. Tiku), 335
Randle, P. J., and others : Insulin Activity of Cord Plasma, 115
Randle, T. C. : High-Energy Nuclear Physics, 371
Random Association of Points on a Lattice (Dr. P. V. Krishna Iyer), 40
Random Noise : Approximate Joint Probability Distribution for Wave Amplitude and Frequency in (R. A. Wooding), 564
Rankama, Prof. Kalervo : Isotope Geology, *review* by Prof. Arthur Holmes, 1038
Rannie, Dr. I. : Cholesterol and Fat Metabolism in relation to Diet and Disease, 775
Rao, Dr. B. Ramachandra (Rao, M. Srirama, and) : Long-Period Fading in Medium-Wave Radio Signals, 459
Rao, C. L. Amba : A New Model Material for Photoelasticity, 81
Rao, M. Srirama, and Rao, Dr. B. Ramachandra : Long-period Fading in Medium-Wave Radio Signals, 459
Rare Blood-Group Antigen, *Chr*$^a$ : A New (F. Kissmeyer-Nielsen), 313
Rare-Earth Elements : Separation of (Dr. M. Lederer), 462
Rare-Earth Mineral from Queensland : Stillwellite, a New (Dr. J. McAndrew and Dr. T. R. Scott), 509
Rat : Reproduction in the (Film by Prof. Richard J. Blandau), 341
Rat (Hyperthyroid) : Protective Action of Vitamin $B_{12}$ in the (Dr. Prema Fatterpaker, Urmila Marfatia and Prof. A. Sreenivasan), 165
Rat Brain ; Significance of Glutamic Acid in Metabolic Processes in the, during Physical Exercise (Dr. R. Vrba), 1258
    A Source of Ammonia and Changes of Protein Structure in the, during Physical Exertion (Dr. R. Vrba), 117
Rat Diaphragm Preparation : Some Differences in the Effects of Different Sympathomimetic Amines on the Isolated Innervated (Dr. Katharine A. Montagu), 738
Rat Liver : Enzymatic Conversion of Alpha-Formamidinoglutaric Acid to Glutamic Acid by (Alfred G. Knudson, Jun.), 830
Rat Liver Nuclei : Preservation of, by Potassium Glycerophosphate (J. St. L. Philpot and J. E. Stanier), 1128
Rat Pituitaries (Infantile), cultivated *in vitro* and Grafted into the Anterior Eye Chamber of Young Cats : Long-term Transplants of (Dr P. M. Martinovitch and D. V. Radivojevitch), 699
Ratcliffe, J. A. : Physics of the Ionosphere, 732
    Solar Eclipses and the Ionosphere, 947
Rate of Milk Secretion with Increasing Interval between Milking (Gillian M. Elliott and Peter J. Brumby), 350
Rates of Unimolecular Pyrolyses of Alkyl Halides in the Gaseous Phase and $S_N1$ Rates in Solution : A Correlation between the (Dr. Allan Maccoll and Dr. P. J. Thomas), 392
Rats : Adrenaline and Noradrenaline in Tissues of Normal, Insulin-treated and Adrenalectomized (Dr. Katharine Montagu), 555
    Immunological Discrimination between the Blood of Normal and of Tumour-bearing (Dr. D. A. Darcy), 643
*Rauwolfia serpentina* Benth : Anti-acetylcholine and Anti-histamine Actions of the Total Alkaloids of (M. L. Chatterjee and H. P. Hiller), 701
Raven, Dr. Charles E. : Christian Faith in the World of Science, *review*, 410
Raven, Chr. P. : Problems of International Concern in the Biological Sciences, 242
Raw Cotton, its Properties and Distribution (Textile Institute Conference on), 677
Rawer, Dr. K. : Solar Eclipses and the Ionosphere, 948
Rawlins, F. I. G. : An Introduction to Deductive Logic, *review*, 1138
Rawson, Dilys : Maturation Divisions of the Ova in the Pseudophyllidean Cestode, *Eubothrium crassum* (Bloch), 167
Rawson, Sir Stanley : Elected chairman of the Engineering Divisional Council of the British Standards Institution, 862
Ray, H. N., and others : 'Kernechtrot' or Nuclear Fast Red in the Histochemical Detection of Calcareous Corpuscles in *Taenia saginata*, 701
Ray, K. C. (Ghosh, Prof. B. N., and) : Electrophoretic Measurement of the True Zeta-Potential of Arsenious Sulphide Sol in the Region of Slow Coagulation, 1080
Rayleigh Equation and Selective Adaptation : Colour Anomaly, the (R. L. Gregory), 172
Raymond, W. F. : Animal Production from Grass, 729
RCA Victor Co., Ltd. : Appointment of Prof. J. R. Whitehead as head of the research laboratories in Montreal, 1005
Reaction of Alloxan with Ascorbic Acid (Prof. M. C. Nath and E. P. M. Bhattathiry), 787
Reaction to Light of Iris-Chromatophores (Ernest Middlemiss), 353
Reaction of Starfish Spermatozoa to Histidine and certain other Substances considered in relation to Zinc (T. Fujii, S. Utida and T. Mizuno), 1068
Reaction (Termination), in Vinyl Polymerization—Preparation of Block Copolymers (Dr. C. H. Bamford and A. D. Jenkins), 78
Reaction (Thermal), between Hydrogen and Nitrogen Dioxide (Dr. P. G. Ashmore and B. P. Levitt), 1013
Reaction Time in Man : Effect of Heat Stress on Serial (D. C. Fraser and K. F. Jackson), 976
Reactions : Tetrazolium Salts as Viability Indicators—Radiation-catalysed (Johnson Parker), 647
Reactions of Herring Larvae to Light—a Mechanism of Vertical Migration (P. M. J. Woodhead and A. D. Woodhead), 349
Reactions to Potato Virus Y (J. Munro), 631
Reactivities (Relative), of Substituted Aromatic Molecules towards Radical Addition : Molecular Orbital Theory of the (H. H. Greenwood), 1024
Reactivity of Freshly Formed Steel Surfaces (A. Prince), 223 ; (Dr. U. R. Evans), 750
Reactor at Harwell : New, 286
Reactor Physics and Chemistry : Peaceful Uses of Atomic Energy—(Dr. J. Gaunt and D. J. Littler), 619
Reactors (Nuclear) : Physics of (Institute of Physics Conference on), 16
Read, Prof. H. H. : Title of professor emeritus in the University of London conferred on, 194
    Retirement from the chair of geology in the Imperial College of Science and Technology, 490 ; work of, 490
Read, Prof. John : Organic Syntheses, *review*, 573
Read, Prof. Margaret : Education and Social Change in Tropical Areas, *review* by R. Brightman, 757
Read, W. H. : Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Reading Technical College, 961
Reagent for the Detection of Chloride and of certain Purines and Pyrimidines on Paper Chromatograms (T. Wood), 175
Reasbeck, Dr. P., and Mayne, Dr. K. L. : The Ages and Origin of Meteorites, 186
    Cosmic Radiation Effects in Meteorites, 733
Reason and Survival in the Modern World, 521
Rebel, J. B. J., and others : Metabolism of Triaryl Phosphates in Rodents, 259
Receptors and Sensory Perception (Dr. Ragnar Granit), *review* by the Rt. Hon. Lord Adrian, 847
Recherche Scientifique en Afrique Centrale, Institut pour la : Cinquième Rapport Annuel, 387
Recherches Scientifiques, Centre National de : Conference on the Applications of Ultrasonics, 387
Reciprocal Exchange of Characters : Apparent, between the *Mel* and *NWS* Strains of Influenza A Virus in the Brain of One-day Old Mice (Dr. K. B. Fraser), 212
Reconciling Spirit and the Economic Order (Prof. C. F. Carter), 239
Reconciliation, Fellowship of : Alex Wood Memorial Lecture (Prof. C. F. Carter), 239
Record : An Uncollected, of the Great Sea-serpent (Denys W. Tucker), 705
Recorded Sound, British Institute of, in conjunction with the Department of Extra-Mural Studies of the University of London : Lectures by Eric Simms on the Language of Birds and other Animals, 677
Recording (Visual), of Radiation Patterns (Prof. W. V. Mayneord), 14
Records (New), in Human Power (Dr. P.-O. Åstrand), 922
Recovery (Total), of the Component Proteins of a Deoxyribonucleoprotein : Characterization and (Dr G. Toennies and B. Bakay), 696
Rectal and Deep Body Temperature in the Calf : Comparison of (Dr. John Bligh), 402
Red Blood Cells of Sheep : Genetic Control of Sodium and Potassium Concentrations in the (J. V. Evans and J. W. B. King), 171
Red Cells (Human) : Transformation of the *Lewis* Groups of (Mrs. Joan S. Sneath and P. H. A. Sneath), 172
Redbrick's Destiny, *review* by J. F. Wolfenden, 411
Rédei, Academician László : Awarded a first-class Kossuth Prize for Research, 14
Redman, Prof. R. O. : International Astronomical Union—General Assembly in Dublin, 626
    International Co-ordination of Galactic Research, *review*, 847
Reduction of Cytotoxic Azo Compounds by Hydrazine and by the Xanthine Oxidase-Xanthine System (Dr. W. C. J. Ross and G. P. Warwick), 298
Reduction of Nitrate by Green Algae : Role of Photochemical Processes in the (Dr. Erich Kessler), 1069
Reduction of Riboflavin to a Stable Free Radical using X-Rays (Dr. A. J. Swallow), 793
Reduction of Tetrazolium Salts : Mechanism of the (B. Jambor), 603

Reduction of Vitamin $B_{12}$ (G. H. Beaven and E. A. Johnson), 1264
Reduction in X-Ray Sensitivity of Seeds by Hydration (Richard S. Caldecott), 306
Reduction (Double), at the Rosy, or Pink, Locus in *Lythrum salicaria* (Sir Ronald Fisher and V. C. Fyfe), 1176
Reduction Processes Illustrated on a Coenzyme I Model Substance: Mechanism of some (Dr. Gabriel Stein and Gad Stiassny), 734
Reductions (Organic): Preparation of Aluminium Borohydride and its Applications in (J. Kollonitsch and O. Fuchs), 1081
Redvanly, Carol S., and others: Benzene-$^{14}C_1$ from the Neutron Irradiation of the Clathrate with Ammoniacal Nickel Cyanide, 831
Rée, H. A.: Man and his Machines, 633
Reed, Dr. George W., and Turkevich, Dr. Anthony: Uranium Content of Two Iron Meteorites, 794
Reed, Dr. R., and others: Apparent Transformation of Collagen Fibrils into 'Elastin', 966
Reed, Dr. R. I. (Gelles, Dr. E., and): Carbon-13 Isotope Effects in the Decarboxylation of some Oxaloacetates, 1262
Rees, Dr. E. Douglas, and Singer, Dr. S. J.: Molecular Weight of Insulin in N,N-Dimethylformamide, 1072

Rensch, Dr. B.: Problems of International Concern in the Biological Sciences, 243
Reporting Back (Management Publications, Ltd.), 775
Reproducibility of Paper Protein Electrophoresis: Accuracy and (R. A. Neely and D. W. Neill), 33
Reproduction: Resistance to Lymphomatosis in the Fowl in relation to (Prof. F. B. Hutt and R. K. Cole), 1178
Reproduction in the Cat-fish, *Clarias mossambicus* Peters. (P. H. Greenwood), 516
Reproduction of Mumps Virus in the Chorio-allantoic Membrane (Dr. H. L. Wolff), 604
Reproduction in the Rat (Film by Prof. Richard J. Blandau), 341
Reproductive Cycle of Ovaries in Fish: Role of Pantothenic Acid in the (Olaf R. Braekkan), 598
Reproductive Organs of Foetal and Juvenile Elephant Seals (W. Nigel Bonner), 982
Research in the Belgian Congo, 630
Research at Harwell, *review* by Dr. P. J. Grant, 370
Research in Hungary: Kossuth Prizes for, 14
Research: Applied Solar Energy (edited by E. J. Burda), *review* by Dr. H. Heywood, 804
  Atomic Energy, at Harwell (K. E. B. Jay), *review* by Dr. P. J. Grant, 370
  Biochemical and Microbiological, in Hungary—Some Impressions (Dr. M. R. Pollock), 1156
  Genetic (Meeting at the Atomic Energy Research Establishment to consider programmes of), 448
  Geophysical, in North America, *review* by B. C. Browne, 943
  High Altitude (National Institute of Sciences of India Symposium, at the Gulmarg Research Observatory), 448
  Jute Production and, 344
  Locust—Discussions in London (P. T. Haskell), 590
  Marine Biological (Dr. N. B. Eales), 108
  Organization and Application of (Symposium at the Twelfth International Congress of Applied Psychology), 449
  Personnel, in the Royal Navy (Surgeon-Comdr. Crosfill), 192
  Recent Lunar (Dr. H. Percy Wilkins), 239
  Scientific, in India (Sir Alfred Egerton), 492
  Scientific, in Russia (translation issued by the Department of Scientific and Industrial Research of a survey in *Priroda* of recent work), 14
  Scientific, and Man-power in the United States, 543
  Water Pollution, in Britain, 106
Research (*Sunday Times* and): Science in Industry Essay Competition for 1955, 862
Research on Ageing (Ciba Foundation Awards), 539
Research on Ageing, British Society for: Discussion on Endocrinology and Ageing, 291
Research on the Biology of Tropical Swamps (Grant of £21,900 from the Nuffield Foundation to Makerere College, Uganda, for), 536
Research in Chemistry: Grants for (Chemical Society), 381
Research in Dairying, National Institute for: Annual Report, 962
Research on Forest Products (Prof. E. P. Stebbing), 248
Research in Genetics (Grant of 30,000 dollars from the Rockefeller Foundation to the Galton Laboratory of University College, London, for), 379
Research into Human Problems (National Coal Board Committee for), 490
Research in Man-power, 43
Research in Nutrition: Drummond Fellowships for (University College, London), 1249
Research in Radio Astronomy: International (Dr. R. L. Smith-Rose), 1110
Research (Aeronautical), in Canada during the Post-War Decade: The Growth of (Dr. J. J. Green), 493
Research (Basic): The Role of Government in (P. E. Klopsteg), 295
  The Role of Industry in (M. E. Speight), 295
  The Role of the University in (Prof. K. S. Pitzer), 295
  In the United States, 295
Research (Brain): The Venezuelan Institute for Neurology and (Dr. Geoffrey H. Bourne), 1049
Research (Cancer): Progress of, 578
Research (Cytochemical), on Coelenterate Nematocysts (M. Hamon), 357
Research (Defence), in the United States: Organization of, 1012
Research (Ecological), Indian Council of: Foundation of the, 1152
Research (Galactic): Co-ordination of (edited by A. Blaauw), *review* by Prof. R. O. Redman, 847
Research (Hormone): Recent Progress in—The Proceedings of the Laurentian Hormone Conference (edited by Gregory Pincus), Vol. 10, *review* by Prof. S. Zuckerman, 138
Research (Industrial): The Education and Training of Graduate Staff for (Fourth Conference of Industrial Research Directors and Managers), 141
Research (Metallurgical), in the United States: Trends in (Dr. E. C. Bain), 725
Research (Nuclear), European Organization for (at Geneva): Foundation-Stone Ceremony, 93
Research (Nuclear), and Development, 334
Research (Nuclear Energy), Joint Establishment for: Third Annual Report (1953–54), 498
Research (Road), for the benefit of the Colonies (Appointment of a Committee by the Secretary of State for the Colonies to advise on matters of), 56
Research (Scientific): Cinematography in (Scientific and Technical Group of the Royal Photographic Society Discussion on), 726
  The Wenner-Gren International Centre for, 1196
  at South African Universities: Register of Current, Vol. 3 (Council for Scientific and Industrial Research, Pretoria), 492
Research (Seaweed), Institute of (Dr. Kathleen M. Drew), 155
Research (Technological Training and): A Hundred Years of, in Switzerland (Prof. Max Wildi), 758
Research Associations, Committee of Directors of: Re-election of Dr. S. Whitehead as chairman, 16
Research Council of Alberta: Thirty-fifth Annual Report (1954), 495
Research Fellowships: Medical (National Research Council of Canada Awards), 102
Research Institute of African Geology: Gift of £100,000 from the Anglo-American Corporation of South Africa, Ltd., to the University of Leeds, for the foundation of a, 1152
Research Laboratories (Agricultural): Laboratory Design—Survey of Space and Services Requirements in Two (R. Llewelyn Davies and J. W. Nightingale, and Norman T. J. Bailey), 999, 1249
Research Scholarships: Postgraduate (Courtaulds' Scientific and Educational Trust Fund Awards for 1955), 770
Researches of I. W. Bailey: Plant Anatomy, *review* by L. I. Scott, 709
Reserpine and related Compounds: Paper Chromatographic and Biological Properties of (Dr. R. J. Boscott and Dr. Amiya B. Kar), 1077
Residential Course of Rural Studies (Institute of Rural Life at Home and Overseas), 149
Residues containing Carbonyl: Contribution of, to the Ultra-Violet Absorption of Lignins (Dr. D. C. C. Smith), 927
Resins (Phenolic): Acid Character of some, in relation to their Structure (Prof. R. P. Mitra and S. S. Dube), 79
Resistance to Lymphomatosis in the Fowl in relation to Reproduction (Prof. F. B. Hutt and R. K. Cole), 1178
Resistance of Metals: Strength and (Prof. John M. Lessells), *review* by Dr. K. M. Entwistle, 571
Resistance (Apparent), of a Snail to Infection in the Gold Coast (Fergus S. McCullough), 981
Resonance (Paramagnetic): Detection of Labile Photochemical Free Radicals by (Dr. D. J. E. Ingram, W. G. Hodgson, C. A. Parker and W. T. Rees), 1227
Resonance Absorption (Paramagnetic), of Ferrihaemoglobin and Ferrimyoglobin Derivatives (J. E. Bennett, Dr. D. J. E. Ingram, Dr. P. George and J. Stanley Griffith), 394
Resonator: An Atomic Standard of Frequency and Time Interval—A Caesium (Dr. L. Essen and J. V. L. Parry), 280
Resources of the Sea, *review* by Norman Holme, 478
Resources (Natural): The Engineer and the Conservation of (E. J. Holmgren), 150
Respiration: Barley Roots—Nitrogen Assimilation and (A. J. Willis and E. W. Yemm), 297
Respiration and Ageing in *Lemna* Fronds: Nitrogen Nutrition, (E. Wangermann and H. J. Lacey), 500

Respiratory Chain Phosphorylation in Extracts of *Azotobacter vinelandii* (Dr. A. Tissières and Prof. E. C. Slater), 736
Respiratory Enzymes in Yeast: Yeast Mitochondria—Subcellular Units involved in the Synthesis of (Prof. Boris Ephrussi and Dr. Piotr P. Slonimski), 1207
Respiratory Function: Pulmonary Circulation and (Symposium at Queen's College, Dundee), 960
Respiratory Increase and Phosphorus and Nitrogen Metabolism in Sweet Potato Infected with Black Rot (Takashi Akazawa and Dr. Ikuzo Uritani), 1071
Response to Adrenocorticotrophic Hormone: Modification of, by the Simultaneous Administration of Gonadotrophic Hormones (Barbara E. Clayton and Joyce E. Hammant), 401
Responsibilities (Social), of Scientists (Prof. J. H. Hildebrand), 430
Responsibility. Problem of Rewarding (G. R. Moxon and H. J. Perkin), 545
Restoration and Enhancement of Proteolytic Action by Polylysine and Polyglutamic Acid: Inhibition, (Eva E. Dellert and Dr. Mark A. Stahmann), 1028
Results of Filter-Paper Electrophoresis An Electronic Computer for the Evaluation of (M. D. Paulik and L. Pinteric), 1226
Retarding Potential: Measurements of, on the Hollow Cathode (Dr. A. W. Bright and J. S. Thorp), 1079
Retief, Dr. Frank: Choice of Drugs in the Treatment of Tuberculosis, 245
Reuter, S., and others: A New Group of DDT Synergists, 266
Reverse-Shearing Interferometry (J. W. Gates), 359
Reversion to the Original Bacillary Forms: Plasma Globules of *Salmonella enteritidis* arising under the Influence of Penicillin and their (J. Vádász and L. Juhász), 168
Rewarding Responsibility: Problem of (G. R. Moxon and H. J. Perkin), 545
Reynolds, G. F.. Polarographic Instrumentation, 198
*Rh* Gene Frequencies in Pacific Populations: Maximum Likelihood Calculation of (Prof. William C. Boyd), 648
Rheology: Surface (British Society of Rheology Conference on), 493
  Surface—Annual Conference of the British Society of Rheology (Dr. E. W. J. Mardles), 819
Rheology, British Society of: Annual Conference, 493, 819
  Discussion on Visco-elastic Behaviour, 61
Rhesus Monkeys: Social Behaviour in (Film by M. R. A. Chance), 341
*Rhizobium* and *Azotobacter*: Filterability of the Swarmers of (J. C. Lawrence), 1033
*Rhizoctonia solani*: Influence of the Origin of the Isolate of, on its Pathogenicity (M. K. Tolba and A. H. Moubasher), 211
Rhizomorphs present in Soil: Isolation of Ectotrophic Mycorrhizal Mycelia from (Dr. Ida Levisohn), 519
Rhodes, D. N.: Micro-determination of Phosphorus, 215
Rhodopsin: Lumi- and Meta- (G. A. J. Pitt and M Tinkham), 220
Rhythm: Biological (Societas pro Studio Rhythmi Biologici fifth Congress on), 149
Riboflavin: Reduction of, to a Stable Free Radical using X-Rays (Dr. A. J. Swallow), 793
Ribonuclease Action of, on Living Cells *in vitro* and Synthesis of Deoxyribonucleic Acid (H. Firket, S. Chèvremont-Comhaire and Prof. M. Chèvremont), 1075
  Action of, on Two Solid Tumours *in vivo* (L. Ledoux), 36
Ribonucleic Acid Content of Dividing *E. coli* Cells: Basophilia and High (H. E. Wade), 310
Rice, Dr. H. M: Sensitivity of the Haemolytic System in Complement Fixation Tests, 730
Rice: Effect of Auxins on the Flowering Behaviour of (Dr. S. M. Sircar and Maya Kundu), 840
Rich, Dr. Alexander, and Crick, Dr. F. H. C.: The Structure of Collagen, 915
Rich, Dr. Alexander (Crick, Dr. F. H. C., and): Structure of Polyglycine II, 780
Richards, D. H. (James, J. A., and). Radioactivation Analysis of Phosphorus in Silicon, 1026
Richards, Merfyn: A Water-soluble Filter for Trapping Airborne Micro-organisms, 559
Richards, M. J.. Factors in the Fluctuations of Populations of Locusts, 590
Richards, Prof. O. W.: Estimations of Numbers of Locusts, 590
Richards, Prof. P. W.: University College of North Wales, Bangor—New Science Buildings, 527
Richardson, Dr. E. G.: Applications of Ultrasonics, 387
Richardson, Dr. E. G. (Pryor, Dr. A. W., and): Visco elastic Behaviour, 62
Richardson, Dr. J. E.: Man and his Machines, 633
Richardson, W. D., and Walker, F. T.: Botany of Seaweed, 1107
Richmond, Anthony H.: The Colour Problem, a Study of Racial Relations, *review* by Prof. T. S. Simey, 416
Richmond, Prof. I. A.: Disposal of the Dead, and Beliefs in an After-Life, 811
Richter, Prof. C. F. (Gutenberg, Prof. B., and): Seismicity of the Earth and Associated Phenomena, second edition, *review* by Ernest Tillotson, 617
  Magnitude and Energy of Earthquakes, 795
Richtmyer Memorial Lecture of the American Physical Society (Prof. E. P. Wigner), 638
Rickayzen, Dr. G.: Intermetallic Semiconductors, 342
Riddiford, L.: High-Energy Nuclear Physics, 371
Rideal, E. K., and others (edited by): Advances in Catalysis and related Subjects, Vol. 6, *review* by Dr. E. B. Maxted, 417
Ridgway, General Matthew B.: Appointed chairman of the Board of Trustees of the Mellon Institute of Industrial Research, Pittsburgh, 16
Ridley's (H. N.) Hundredth Birthday (J. W. Purseglove), 1092
Riehl, Herbert: Tropical Meteorology, *review* by Prof. P. A. Sheppard, 989
Riet Lowe, Prof. C. van: Retirement from the directorship of the Archaeological Survey of the Union of South Africa, 149
Rift Valley Fever (Neurotropic): A Brain Factor Influencing the Viability of (Dr. A. Polson and T. I. Madsen), 645
Riley, J. F., and others: Function of Heparin, 1123
Rimmer, S. M.: Appointed veterinary officer, Tanganyika, 1249
Ripley, G. W., and others: Electron Microscopic Observations on the Structure of the Sieve Plates in *Cucurbita*, 868
Rishbeth, J.. Banana Wilt Disease, 1198
Risks to Wild Life: Toxic Chemicals in Agriculture—, 380
Ritchie, Prof. James: Elected president for 1955–56 of the Royal Society of Edinburgh, 907
Rittenberg, D. (Krasna, A. I., and). Physical Chemistry of Enzymes, 959
River (Colorado): Paleomagnetic Study of Rocks from the Grand Canyon of the (Richard E. Doell), 1167
Road Research for the benefit of the Colonies (Appointment of a Committee by the Secretary of State for the Colonies to advise of matters of), 56
Road Research Laboratory: Establishment of a Colonial Road Research Section, 56
  Technical Paper No. 34, Testing Concrete by an Ultrasonic Pulse Technique (Dr. R. Jones and E. N. Gatfield), 538
  Appointment of Dr. R. S. Millard as head of the Colonial Section, 1101; work of, 1101
Roads (Roman), in Britain (Ivan D. Margary), Vol. 1, South of the Foss Way–Bristol Channel, *review* by Sir Mortimer Wheeler, 3
Roads (Roman), in Southern England, *review* by Sir Mortimer Wheeler, 3
Robert, L., and Polonovski, J.: Physical Chemistry of Enzymes, 958
Roberts, A.. High-Energy Nuclear Physics, 371
Roberts, Sir Harold Use and Abuse of Protective Equipment, 1252
Roberts, Dr. J. A. Fraser: Genetics and Medicine, 532
Roberts, V., and Quarrington, J. E.: Intermetallic Semiconductors, 342
Robertson, Prof H. P.: At the Conference in celebration of the Jubilee of the Relativity Theory, 331
Robertson, Dr. J. H.: Appointed lecturer in the Department of Inorganic and Structural Chemistry in the University of Leeds, 194
Robertson, Dr. John H., and others: Structure of Vitamin $B_1$—The Crystal Structure of the Hexacarboxylic Acid derived from $B_{11}$ and the Molecular Structure of the Vitamin, 325
Robertson, Prof. J. Monteath (Porte, A. L., and) Configurations of Tiglic and Angelic Acids—an X-Ray Determination, 1116
Robertson, Dr. W. G. P., and others. Steric Effects in the Formation of Copper and Cobalt Complexes with the Epimeric Salicylidene-menthylamines, 832
Robinson, Dr. D. H.: Appointed provincial director of the West Midland Province, National Agricultural Advisory Service, 539
Robinson, F. A.: Biological and Microbiological Methods of Estimating Vitamin $B_{12}$, 384
Robinson, F. N. H.: Awarded the Clerk Maxwell Premium for 1954 of the British Institution of Radio Engineers, 536
Robinson, Dr. G. D.. Radiative Balance in the Atmosphere, 635
Robinson, M. (Kanagy, Dr. J. R., and). Studies of Leather by means of a Sonic Technique, 587
Robinson, Sir Robert: Organo-Metallic Compounds, 59
  Science and the Scientist (Presidential Address to the British Association for the Advancement of Science), 433
  Advances in Organic Chemistry, 760
  New Laboratories at the Fulham works of the North Thames Gas Board opened by, 1154
  The Structural Relations of Natural Products, *review* by Prof. D. H. R. Barton, 1236
Robinson, Roy: Two New Mutations in the Syrian Hamster, 353
Robson, Dr. A., and Corfield, M. C.. Chemistry of Wool, 713
Rochester, Dr. G D. Awarded a Charles Vernon Boys Prize for 1956 of the Physical Society, 251
Rochon-Duvigneaud, R., et autres: Vertébrés—Embryologie, grands problèmes d'anatomie comparée, caractéristiques biochimiques (Traité de Zoologie, publié sous la direction de Pierre-P. Grassé, Tome 12), *review* by Prof. C. H. O'Donoghue, 756
Rock at Grates Cove: The Last Voyage of John Cabot and the (Prof. Arthur Davies), 996
Rock Rabbits: Microfilaraemia in (Dr. A. Smith), 38
Rockall: Geology of, 909
Rockefeller Foundation, New York Grant of 21,000 dollars for the purchase of research equipment in the Department of Microbiology, Queen's University, Belfast, 57
  Grant of 30,000 dollars to the Galton Laboratory of University College, London, for research in genetics, 379
  Gift of £100,000 to the University of Oxford, towards the cost of providing research laboratory facilities and equipment at the Radcliffe Infirmary, 769
  Award of 30,300 dollars to the Davy Faraday Laboratory of the Royal Institution, to aid researches on proteins, 1112
  Award of 40,000 dollars to the University of Cambridge, for the Medical Research Council's Unit in the Cavendish Laboratory, to aid researches on proteins, 1112
  Award of £3,000 to the Chemical Crystallography Laboratory, Oxford, 1112
  Award of £4,000 to the Department of Chemical Pathology, St. Mary's Hospital Medical School, London, for the purchase of a 'Spinco' preparative ultracentrifuge and an electrophoresis apparatus, 1112
  Award of £2,700 to the Department of Zoology, University College, London, for the purchase of a 'Spinco' preparative vacuum ultracentrifuge, 1113
Rocket: A 'Tropical Storm' Photographed from a (L. F. Hebert and O. Berg), 1198
Rockets (High-Altitude): Exploration of the Earth's Upper Atmosphere, using—British Research Programme (Sir David Brunt), 282
Rocks from the Grand Canyon of the Colorado River: Paleomagnetic Study of (Richard R. Doell), 1167
Rodén, Lennart, and others: Glutamine as an Accelerator of Chondroitin Sulphate Synthesis, 601
Rodents: Demonstration *in vivo* and *in vitro* of Peristaltic Contractions in the Portal Vein of Adult Mammals (Prof. G Attardi), 76
  Metabolism of Triaryl Phosphates in (Dr. D K. Myers, J. B. J. Rebel, C. Veeger, A. Kemp and E. G. L. Simons), 259
Rodger, Alec: The Effective Use of Manpower (Presidential Address to Section J (Psychology) of the British Association for the Advancement of Science), 444
  Twelfth International Congress of Applied Psychology, 449
Roesler, Dr. F. C (Kolsky, Dr. H., and). Visco-elastic Behaviour, 61
Roffey, J. Factors in the Fluctuations of Populations of Locusts, 590
Rogers, Dr. J. S.: Physics for Medical Students, third edition, *review* by G R. Noakes, 185
Role of Glutamine in Urea Synthesis (Dr. S. J. Bach and Margaret Smith), 1126

Rollin, Dr. B. V., and Petford, A. D.: Intermetallic Semiconductors, 342
Rolling Action: Formation of Tubes by a Simple—A New Normal-Pressure Effect (M. J. Egan and A. Jobling), 689
Rollinson, D. H. L.: Œstrus in Zebu Cattle in Uganda, 352
Rolls-Royce, Ltd., and others: Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
Roman Roads in Britain (Ivan D. Margary), Vol. 1, South of the Foss Way–Bristol Channel, *review* by Sir Mortimer Wheeler, 3
Roman Roads in Southern England, *review* by Sir Mortimer Wheeler, 3
Romance of the Great Barrier Reef (Frank Reid), *review* by Prof. J. A. Steers, 571
Romer, Prof. Alfred Sherwood: Herpetichthyes, Amphibioidei, Choanichthyes or Sarcopterygii?, 126
Romijn, Prof. C.: Use of Seaweed Meals in Human and Animal Nutrition, 1107
Rook, J. A. F. (Head, M. J., and): Hypomagnesaemia in Dairy Cattle and its Possible Relationship to Ruminal Ammonia Production, 262
Rooksby, Dr. H. P.: Theory and Practice of Neutron Diffraction, *review*, 895
Rooksby, Dr. H. P., and others (edited by): X-Ray Diffraction by Polycrystalline Materials, *review* by Dr. A. Guinier, 710
Room Temperature: Photochemical Processes in Solids at (Roger A. Ford), 1023
Root (Tree) Development, on Upland Heaths (C. W. Yeatman), 675
Root Nodules: Nitrogen Fixation in Detached Non-legume (Dr. G. Bond and J. T. MacConnell), 606
Roots: Barley—Nitrogen Assimilation and Respiration (A. J. Willis and E. W. Yemm), 297
Roots (Bean): Modification of X-Ray Sensitivity of, by Hydrogen Gas (Dr. Michael Ebert and Dr. Alma Howard), 828
Roper, Lanning (edited by Synge, P. M., and): The Fruit Year Book, 1955, *review* by Dr. John Grainger, 322
Rosbaud, P.: Problems of International Concern in the Biological Sciences, 242
Roscoe, Dr. R.: Visco-elastic Behaviour, 61
Rose, Dr. P. H.: Appointed lecturer in physics at the University of Birmingham, 1055
Rosen, Milton W.: Influence of Space Flight on Engineering and Science, 1190
Rosenau, Werner, and others: Changes in Animal Tissue after Hydrocortisone Administration—Production of Dystrophic Calcification of Cardiac Muscle in Mice by Hydrocortisone, 503
Rosenfeld, L., and Weisskopf, V. (edited by Pauli, W., with the assistance of): Niels Bohr and the Development of Physics, Essays dedicated to Niels Bohr on the occasion of his Seventieth Birthday, *review* by Prof. W. E. Burcham, 1186
Rosette Nebula: Radio-Frequency Radiation from the (H. C. Ko and Prof. J. D. Kraus), 221
Ross, Prof. A. S. C., and Bell, Dr. D. A.: Information Theory, 774
Ross, I. M.: Chemical Aspects of Semiconductors, 153
  Intermetallic Semiconductors, 341
  Design of Electronic Devices for Production, 1060

Ross, Dr. N. S.: A Policy for Wages, *review*, 183
Ross, Dr. W. C. J., and Warwick, G. P.: Reduction of Cytotoxic Azo Compounds by Hydrazine and by the Xanthine Oxidase-Xanthine System, 298
Rostand, Jean: Life, the Great Adventure (translated by Alan Houghton Brodrick), *review* by T. H. Hawkins, 323
Rosy, or Pink, Locus in *Lythrum salicaria*: Double Reduction at the (Sir Ronald Fisher and V. C. Fyfe), 1176
Rotational Slip (Flexural), as the Main Deformation Process in the Torsion of Zinc Crystals (A. D. Whapham and Dr. H. Wilman), 460
Rothamsted Experimental Station: Appointment of F. G. W. Jones as head of the Nematology Department, 1002
  Report for 1954, 1253
Rothlin, Prof. E. (Cerletti, A., and): Role of 5-Hydroxytryptamine in Mental Diseases and its Antagonism to Lysergic Acid Derivatives, 785
Rothschild, Hon. Miriam (Mrs. G. Lane): Myxomatosis, 1155
Roudsea Wood Nature Reserve, 684
Roughton, F. J. W.: Physical Chemistry of Enzymes, 959
Roughton, F. J. W. (Gibson, Q. H., and): Physical Chemistry of Enzymes, 960
Rous Fowl Sarcoma Cells: Site of Virus-like Particles in (M. A. Epstein), 784, erratum, 862
Roux, Marie, and others: Influence of Cortisone on Connective Tissue—Epithelial Relations in Wound Healing, Hair Regeneration and the Pathogenesis of Experimental Skin Graft, 932
Row, Dr. L. Ramachandra (Pavanaram, S. K., and): New Flavones from *Pongamia pinnata* (L.) Merr.—Identification of Compound D, 1177
Rowan, L. C., and others: Relationships between the Flying Fox (Genus *Pteropus*) and Arthropod-borne Fevers of North Queensland, 472
Rowe, D. S.: Appointed to a research fellowship in experimental pathology at the University of Birmingham, 862
Rowe, E. G.: Design of Electronic Devices for Production, 1060
Rowe-Leete, H. W.: Polarographic Instrumentation, 198
Rowett Research Institute: Collected Papers, Summary and Subject Reviews, Vol. II (1954), 57
Rowlands, Dr. I. W.: Breeding of Laboratory Animals, 244
Rowntree, J. B.: Introduction to the Vegetation of the Assam Valley, 200
Rowson, L. E. A., and others: Transfer of Mammalian Ova between Species, 167
Royal Aeronautical Society: British Commonwealth and Empire Lecture (Dr. J. J. Green), 493
  Election of E. T. Jones as president for 1956–57, 723
Royal Aircraft Establishment, Farnborough: Retirement of Sir Arnold Hall from the directorship, 241
  Appointment of G. W. H. Gardner as director, 241
Royal Astronomical Society: Presentation to Prof. F. J. M. Stratton, 378
  Eddington Medal for 1955 presented to Prof. H. C. van de Hulst, 378
Royal Botanic Gardens, Kew: Work during 1954, 1009
Royal College of Surgeons: Wellcome Museums opened by Sir Henry Dale, 1201
Royal Commission on the Civil Service: Report for 1953–55, 1234
Royal Commission for the Exhibition of 1851: Awards for 1955, 58
Royal Entomological Society: Presentation of a Jubilee Volume to Dr. Karl Jordan in honour of his ninety-fourth birthday, 1247
Royal Free Hospital School of Medicine: Appointment of Dr. E. O'F. Walsh to the University of London readership in biochemistry, 1005
Royal Geographical Society and the Alpine Club: Mount Everest Foundation, 239
Royal Greenwich Observatory: Appointment of Dr. R. van der Riet Woolley as Astronomer Royal, 16, 55
  Retirement of Sir Harold Spencer Jones as Astronomer Royal, 55
  Annual Report for 1954–55, 641
Royal Holloway College, London: Appointment of Dr. P. M. Butler to the University of London readership in zoology, 957
  Appointment of Dr. E. J. Bourne to the University of London chair of chemistry, 1104, 1197
Royal Institute of Chemistry: Symposium on Chemical Aspects of Semiconductors, 153
Royal Institute of Chemistry (Manchester and District Section): Exhibition of Laboratory Apparatus and Techniques with particular reference to Instrumentation, 1104
Royal Institute of Chemistry, and others: Symposium on Organo-Metallic Compounds, 59
  Symposium on the Use of Radioactive Materials in Biological Assay, 427
Royal Institution: Lectures, 724
  Woodhull Lecture (Prof. J. B. S. Haldane), 769
  Christmas Lectures for a Juvenile Auditory (Prof. H. W. Melville), 725, 1056
  Award of 30,300 dollars by the Rockefeller Foundation of New York to the Davy Faraday Laboratory, to aid the researches on proteins, 1112
Royal Medals for 1955 of the Royal Society awarded to Sir Alexander Todd and Prof. V. B. Wigglesworth, 953, 1093
Royal Meteorological Society: Election of Officers, 16
Royal Meteorological Society and the Council for the Promotion of Field Studies: Vacation Courses in Synoptic Meteorology, 1248
Royal Meteorological Society (Physical Society and the): Conference on Cloud Physics, 770, 1104
Royal Microscopical Society (Industrial Section): Symposium and Exhibition on Fibre Microscopy, 493, 910
Royal Navy: Personnel Research in the (Surgeon-Comdr. Crosfill), 192
  Sea-going Facilities for Naval Scientific Workers, 1247
Royal Observatory, Hong Kong: Appointment of P. Peterson as scientific officer, 195
Royal Photographic Society (Scientific and Technical Group): Discussion on Cinematography in Scientific Research, 726
  Conference on Photographic Science and Technique, 957
Royal Sanitary Institute: To be known in future as the Royal Society for the Promotion of Health, 241
Royal Society of Arts: Thomas Holland Memorial Lecture (Sir Alfred Egerton), 492
Royal Society of Edinburgh: Election of Honorary Fellows, 56
  Retirement of G. A. Stewart as assistant secretary and librarian, 675
  Appointment of W. H. Rutherford as assistant secretary, 725
  Election of Officers for 1955–56, 907
  To award a David Anderson-Berry Silver-Gilt Medal in 1956, 1249
Royal Society of London: Grant of £580 to Queen's University, Belfast, to support research in mathematics, 57
  Gift of £940 to the University of Leeds for the Department of Physics, 194
  Discussion on Magneto-Hydrodynamics, 234
  Discussion on Radiative Balance in the Atmosphere, 635
  Medal Awards for 1955, 907, 953, 1093
  Award of Royal Medals for 1955 to Sir Alexander Todd and Prof. V. B. Wigglesworth, 953, 1093
  Functions of the Royal Society (Anniversary Address by Lord Adrian), 1095
  Election of Officers, 1100
Royal Society Antarctic Expedition, 815
Royal Society and the Soviet Relations Committee of the British Council: Visit of Russian Scientists to Britain arranged by, 954
Royal Society for the Promotion of Health: New name of the former Royal Sanitary Institute, 241
Royal Society of New Zealand: Report of the Eighth Science Congress, 1200
Royal Swedish Academy of Technical Sciences: IVA Grand Gold Medal conferred on Dr. K. H. Gustavson, 910
Royal Technical College, Glasgow: Report on Research, Session 1953–54, 21
Royal Technical College, Salford: Advanced Course on Polarography, 725
Rubber Development Board, British: Annual Report for 1954, 632
Rubber Research Institute of Malaya: Annual Report for 1952, 380
Rubber Technical Developments, Ltd.: Annual Report for 1954, 632
Rubber-Stichting: Work of the, 536
Rubbo, Prof. S. D., and Cymerman-Craig, Dr. J.: Anti-Tuberculous Activity of Verazide (1-isoNicotinoyl-2-veratrylidene Hydrazine), 887
Rubbo, Prof. S. D., and others: Mode of Action of isoNicotinic Hydrazide, 34
Rugby School Natural History Society: Report for 1954, 147
Ruck, H. C.: Appointed horticulturist, Cyprus, 16
Ruiter, Dr. L. H.: Awarded a renewal of a Ramsay Memorial Fellowship, 336
Ruiz, J. Cano, and MacEwan, Dr. Douglas M. C.: Nature of Calcium Sulphate Gels in Ethylene Glycol, 1169
  Interlamellar Sorption Complexes of Graphitic Acid with Organic Substances, 1222
Rumen: Xylanase in the Soil and the (H. Sørensen), 74
Ruminal Ammonia Production: Hypomagnesaemia in Dairy Cattle and its Possible Relationship to (M. J. Head and J. A. F. Rook), 262
Ruminants: Identification of Pseudocholinesterase in the Tissues of (Prof. B. Mendel and Dr. D. K. Myers), 783
Runcorn, Dr. S. K.: Palaeomagnetism of Sediments from the Colorado Plateau, 505

Runcorn, Dr. S. K. (Day, A. A., and): Polar Wandering—some Geological, Dynamical and Palaeomagnetic Aspects, 422
Runnalls, O. J. C., and Boucher, R. R.: Neutron Yields from Americium–Beryllium Alloys, 1019
Runnström, J.: Problems of International Concern in the Biological Sciences, 243
Rural England, Council for the Preservation of: Twenty-ninth Annual Report (1954–55), 816
Rural Life at Home and Overseas, Institute of: Residential Course of Rural Studies, 149
Rural Studies: Residential Course of (Institute of Rural Life at Home and Overseas), 149
Rushton, Dr. W. A. H.: Recent Physiological Work on Visual Pigments, 769
Rusinko, jun., Frank, and others: Anisotropy of Effective Gas Diffusion Coefficients in Extruded Carbon Rods, 1167
Russell, Earl: The Effects of Nuclear Weapons, 289
Russell, Bertrand, and others: The Bomb—Challenge and Answer (edited by Gilbert McAllister), 522; *review* by R. Brightman, 894
Russell, C. (Dale, W. M., and): Chemical Effects of Ionizing Radiation, 197
Russell, D. W.: Advances in Molecular Spectroscopy, 681
Russell, Dr. E. W.: Appointed director, East African Agriculture and Forestry Research Organization, East Africa High Commission, 1249
Russell, F. S.: Series of Hydroid Medusae presented to the British Museum (Natural History), 816
Russell, Sir John: Food Production in South Africa, *review*, 90
  *Obituary* of Dr. C. S. Orwin, 237
  The United Nations Food and Agriculture Organization, *review*, 941
Russell, L. B., and Russell, W. L.: Progress in Radiobiology, 683
Russell, Prof. P.: Psychology and the Film, 1110
Russell, P.: Inactivation of Phenyl Mercuric Acetate in Groundwood Pulp by a Mercury-resistant Strain of *Penicillium roqueforti* Thom, 1123
Russell, Dr. Paul F.: Man's Mastery of Malaria, *review* by Dr. E. Ashworth Underwood, 1040
Russell, Prof. R. W., and others: Effects of Hypothermia on Behaviour, 1015
Russell, W. L. (Russell, L. B., and): Progress in Radiobiology, 683
Russia: Scientific Research in (translation issued by the Department of Scientific and Industrial Research of a survey in *Priroda* of recent work), 14
Russian Scientists: Visit of, to Britain (Arranged by the Royal Society and the Soviet Relations Committee of the British Council), 954
Rust Resistance in Sunflowers (*Helianthus annuus* L.), (Eric D. Putt and Dr. W. E. Sackston), 77
Rust Uredospores (Germinating): Self-Inhibition in (F. R. Forsyth), 1103
Rutherford, W. H.: Appointed assistant secretary of the Royal Society of Edinburgh, 725
Rutherford Lecture for 1956 of the Physical Society (Prof. P. I. Dee), 241
Rutishauser, Dr. A.: Genetics of Endosperm, 210
Ryder, C. (Macrae, J. C., and): Thermal Expansion of Coal, 265
Rylance, H. J., and others: Antitubercular Effect of an Extract of *Adhatoda vasica*, 119
Ryland, A. K., and Storey, Dr. H. H.: Physiological Races of *Puccinia polysora* Underw., 655
Ryle, M.: Solar Eclipses and the Ionosphere, 948

SABINE, Dr. P. A.: Exhibition of rock specimens collected on Rockall by James Fisher, 909
*Saccharomyces*: Gene Control of Copper-Sensitivity in (Arturo Brenes-Pomales, Gertrude Lindegren and Prof. Carl C. Lindegren), 841
Sachar, R. C. (Maheshwari, Prof. P., and): So-called Endosperm Embryos in *Isomeris arborea* Nutt., 470
Sackston, Dr. W. E. (Putt, Eric D., and): Rust Resistance in Sunflowers (*Helianthus annuus* L.), 77
Sahasrabudhe, M. B. (Narurkar, M. V., and): A New Method for 'Hydrolysis' of Nucleic Acids with Phosphorus Pentoxide, 883
Sainsbury, Dr. P.: Psychology and the Film, 1110
Saker, Dr. E. W.: Intermetallic Semiconductors, 343
Salaman, Dr. R. N.: *Obituary* by Dr. P. S. Hudson, 97
Salicylidenementhylamines (Epimeric): Steric Effects in the Formation of Copper and Cobalt Complexes with the (C. S. Hocking, Dr. W. G. P. Robertson and Dr. B. O. West), 832
Salisbury, Lord: Applied Psychology, 449
Salisbury, Sir Edward: Fruit and Seed Production, 724
Salivary Glands of the Hamster: Autoradiographic Localization of Iodine-131 in the (B. Cohen, J. H. Logothetopoulos and N. B. Myant), 1268
*Salmonella enteritidis*: Regeneration of the Filtrable Forms of, in Media containing Blood Plasma (Fibrin Structure), (I. Juhász and J. Vadász), 208
  Plasma Globules of, arising under the Influence of Penicillin and their Reversion to the Original Bacillary Form (J. Vadász and I. Juhász), 168
*Salmonella typhimurium* Cultures: Turbidimetric Measurement on Synchronized (Dr. V. G. Bruce, K. G. Lark and O. Maaløe), 563
Salt, Dr. George: *Obituary* of Prof. C. T. Brues, 628
Salt Solution at Neutral pH: Isolation and Properties of a Collagen soluble in (D. S. Jackson and J. H. Fessler), 69
Salters' Institute of Industrial Chemistry: Awards, 194
Salts (Powdered): Charge acquired by, on moving over Metal Surfaces (Dr. B. A. Cooke), 264
Salts (Tetrazolium): Mechanism of the Reduction of (B. Jambor), 603
Salts (Tetrazolium), as Viability Indicators—Radiation-catalysed Reactions (Johnson Parker), 647
Salvo Kill Probabilities for Square Targets: Table of (United States National Bureau of Standards, Applied Mathematics Series, No. 44), *review* by J. H. Pearce, 848
Salzen, E. A.: Appointed scientific officer, marine biologist, West African Fisheries Research Institute, Sierra Leone, 1249
Salzman, Norman P., and others: Identification and Pharmacological Properties of a Major Metabolite of Chlorpromazine, 1122
Sampling Arthropods and Mollusca from Herbage by Suction: A Method for (Dr. C. G. Johnson, Dr. T. R. E. Southwood and Mrs. H. Entwistle), 559
Samsonowicz, Prof. J.: Awarded a Polish Medal for research into depth structures of the Polish Plain, 336
Samuelsson, Prof. Gunnar: Distribution Maps of Scandinavian Species of *Hieracium*, 240
San Diego Zoological Society: Ellen Browning Scripps Fellowship for 1955–56 awarded to Dr. Gordon W. Ballmer, 957
Sands (High-Silica): Adsorption of Methylene Blue by (G. Mitchell, P. Poole and H. D. Segrove), 1025
Sandys, J. A.: Appointed chief agricultural officer, Nyasaland, 16
Sanger, Dr. F.: The Chemistry of Insulin (Bedson Club Lecture), 586
  Lecture at the International Wool Textile Research Conference, Australia, 712
Sanger, Dr. Ruth: An Association between the *P* and *Jay* Systems of Blood Groups, 1163
Sanitary Institute, Royal: To be known in future as the Royal Society for the Promotion of Health, 241
Santanam, M. S., and others; Occurrence of Chitin in the Epicuticle of an Arachnid *Palamneus swammerdami*, 557
Santos, R. F., and others: Insulin Activity of Cord Plasma, 115
Sap (Plant): Evidence of Translocated Antibiotics in Expressed (S. H. Crowdy and D. Pramer), 335
Sarcoma Cells (Rous Fowl): Site of Virus-like Particles in (M. A. Epstein), 784, *erratum*, 862
Sarcoma 37 Mouse Ascites Tumour in Peritoneal Fat: Growth of (Dr. Peter Warner), 1030
Sarcopterygii?: Herpetichthyes, Amphibioidei, Choanichthyes or (Prof. Alfred Sherwood Romer), 126; (Dr. Ethelwynn Trewavas, Dr. E. I. White, N. B. Marshall and Denys W. Tucker), 126
Sargeaunt, H. A.: Appointed assistant to Dr. H. P. Robertson, of the United States, scientific adviser to General Gruenther, the Supreme Allied Commander, Europe, 539
Sarjant, Prof. R. J.: Smoke Abatement in Britain—Conference in Bournemouth, 863
Sarkar, S. K. (Sharma, A. K., and): A New Technique for the Study of Chromosomes of Palms, 261
Satchell, D. P. N. (Gold, Dr. V., and): Hydrogen Isotope Exchange between Aromatic Molecules and Aqueous Acids, 602
Saunders, P. R., and Ward, A. G.: Mechanical Properties of Degraded Gelatins, 26
Savile, A. H.: Appointed chief agriculturist, Kenya, 16
Savory, Dr. H. N.: Disposal of the Dead, and Beliefs in an After-Life, 811
Saxl, Miss H., and others: Apparent Transformation of Collagen Fibrils into 'Elastin', 966
Sayer, H. J.: Aggregation and Gregarious Behaviour of Locusts, 590
Sayer, H. J., and others: Migration, 772
Sayers, B. McA., and others: Experiments on the Complete Suppression of Stammering, 874
Sayers, Dorothy L.: Œdipus Simplex—Freedom and Fate in Folklore and Fiction, 724
Sayers, Prof. J.: Solar Eclipses and the Ionosphere, 948
Scale between the Atomic and Microscopic Dimensions: Structure on a (International Union of Crystallography Symposium on), 1153
Scandinavian Species of *Hieracium*: Distribution Maps of (Prof. Gunnar Samuelsson), 240
Scattering (Low-angle), of X-Rays: Structure in Vitreous Silicates as shown by (L. C. Hoffman and W. O. Statton), 561
Schechtman, A. M., and Knight, Patricia F.: Transfer of Proteins from the Yolk to the Chick Embryo, 786
Schenck, J. R., and others: Identity of Cephalosporin *N* and Synnematin *B*, 551
Schieldrop, Prof. E. B.: Dissemination of Science, 1008
Schild, Dr. H. O. (Mongar, Dr. J. L., and): Inhibition of Histamine Release in Anaphylaxis, 163
Schilling, Dr. R. S. F.: Dust and Health in Industry, 763
  Appointed to the University of London readership in occupational health at the London School of Hygiene and Tropical Medicine, 862
Schmid, Prof. H.: Chemistry of Naturally Occurring Pyrones, 638
Schmidt Telescope of the Hamburg Observatory: The New (Dr. O. Heckmann), 805
Schmidt Telescopes: Problems, Methods and Astronomical Programmes relating to (Symposium at the Hamburger Sternwarte), 149
Schmitt, Prof. Francis O.: To take up the special appointment of Institute professor at the Massachusetts Institute of Technology, 814; work of, 814
Schneider, Dr. John J. (Lewbart, Marvin L., and): Paper Chromatography of Steroid Glucuronosides and Sulphates, 1175
Schneider, J. W., and others: Terminal Groups of Tobacco Mosaic Virus, 456
Schöberl, Prof. A., and Wagner, Annemarie: Chemistry of Wool, 713
Schofield, Dr. R. K.: Appointed reader in soil science in the Department of Agriculture, University of Oxford, 910
Scholarship for Research at the Zoological Station, Naples: Offer of a Gabriella Zuccari (University of Padua), 149
Scholarships: Overseas (Royal Commission for the Exhibition of 1851 Awards), 58
  Postgraduate Research (Courtaulds' Scientific and Educational Trust Fund Awards for 1955), 770
Scholarships to British graduates in Science and Technology (Massachusetts Institute of Technology), 381
Scholarships in Glass Technology tenable at the University of Sheffield (Worshipful Company of Glass-Sellers of London), 770
Scholarships in Husbandry: Postgraduate (Department of Agriculture for Scotland Awards), 677
Scholefield, Fred: Honorary life membership of the Textile Institute conferred on, 908
Scholes, G.: Chemical Effects of Ionizing Radiation, 197
Schonfellinger, H., and others: Distribution of Radiocarbon in Tobacco Mosaic Virus, 306
Schonland, Dr. B. F. J.: Lightning and the Long Electric Spark, 724
School Children: Christmas Lectures for, 1056
School Natural History Societies, Association of: *The Starfish*, No. 8, 586
  Annual Exhibition, 1955 (O. N. Bishop), 1007
School Nature Study Union: Biennial Exhibition, 58
Schools: Biology in, *review* by Dr. W. L. Sumner, 570
  Industrial Fund for the Advancement of Scientific Education in, 860
  Support for Science Teaching in, 1037

Schools (Grammar): The Teaching and Learning of Biology in Secondary Schools, with Special Reference to (Prof. L. T. Green), second edition, *review* by Dr. W. L. Sumner, 570
Schools (Secondary), with Special Reference to Grammar Schools: The Teaching and Learning of Biology in (Prof. L. T. Green), second edition, *review* by Dr. W. L. Sumner, 570
Schramm, Prof. G., and others. Terminal Groups of Tobacco Mosaic Virus, 456
Schroeder, Wolfgang (Voigt, Klaus D., and): Nitrogen-containing Steroids in Aqueous Adrenal Cortical Extracts, 599
Schroeder, William C. (Bigelow, Henry B., and): Fishes of the Western North Atlantic, Part 2, Sawfishes, Guitarfishes, Skates and Rays; Chimaeroids, *review* by Dr. G. A. Steven, 139
Schubert, G., and others · Progress in Radiobiology, 684
Schuhmacher, J. P.: Coal Science, 104
Schuler, H.: Advances in Molecular Spectroscopy, 682
Schuler, R. H., and Allen, A. O.: Chemical Effects of Ionizing Radiation, 197
Schulman, Dr. J. H., and others: Physical Chemistry of Enzymes, 958
Schulman, T., and others: Enzymatic Coagulation of Semen, 1209
Schultz, Dr. John R., and Cleaves, Dr. Arthur B.. Geology in Engineering, *review* by Dr. F. J. North, 1091
Schuurmans, D. M., and others: Identity of Cephalosporin *N* and Synnematin *B*, 551
Schuyer, J.: Coal Science, 104
Science: Appointment of Prof. G. DuShane as editor of, 722
Science · Christian Faith in the World of, *review* by Dr. Charles E. Raven, 410
  The Dissemination of (Unesco Conference on), 1008
  The Fragmentation of (Ritchie Calder), 447
  The Impact of, on Management in the Future (British Institute of Management Conference on), 677, 1108
  Influence of Space Flight on Engineering and (Milton W. Rosen), 1190
  Interpretation of, 753
  The Intrinsic Value of, 409
  The Threat to, 1134
  The Tower of Babel—the Language Barrier in (B. C. Vickery), 939
  Use and Abuse of English in, 845
Science of the Past. Literature of the, *review* by Prof. E. N. da C. Andrade, 663
Science in Industry Essay Competition for 1955 (*Sunday Times* and *Research*), 862
Science of Petroleum (edited by Dr. B. T. Brooks and Dr. A. E. Dunstan), Vol. 5, Part 3, Refinery Products, *review* by Lieut.-Colonel S. J. M. Auld, 522
Science and British Railways (T. M. Herbert), 20
Science and Christian Belief (Prof. C. A. Coulson), *review* by Dr. Charles E. Raven, 410
Science and Engineering: The Partnership of (Sir Edward Appleton), 821
Science and Freedom—The Proceedings of a Conference convened by the Congress for Cultural Freedom, Hamburg, 1953, *review* by R. B., 139
Science and the Human Imagination (Dr. Mary B. Hesse), *review* by Prof. C. A. Coulson, 846
Science and the Humanities, *review* by Prof. C. A. Coulson, 846
Science and Petroleum, *review* by Lieut.-Colonel S. J. M. Auld, 522
Science and the Scientist (Sir Robert Robinson), 433

Scientific Instrument Manufacturers' Association: Permanent Exhibition of instruments made by member firms, 1249
Scientific Instrument Manufacturers Association and the United Kingdom Atomic Energy Authority. Radio Isotope Instrumentation and Accessories (Dr. D. Taylor and A. G. Peacock), 1102
Scientific Instrument Research Association, British: Bibliographical Survey of Pressure Devices (P. J. Geary), 676
Scientific Library Centre in London, 955
Scientific Man-power in Britain and its Utilization, 365, *erratum*, 539
Scientific Management, 1108
Scientific Material (Foreign): Index of Translations of (Leslie Wilson), 1276
*Scientific Monthly*: Appointment of Prof. G. DuShane as editor of, 722
Scientific Papers: English Style in (Dr. John R. Baker), 851; (Prof. E. G. Cox), 1250; (D. M. Desoutter), 1250; (P. J. Edmonds), 1250; (Denys W. Tucker), 1251; (David Want), 1251
Scientific Papers (Egyptian): Classified List of, Vol. 3 (1953), (National Research Council of Egypt), 676
Scientific Papers (New Zealand): Abstracts of, 336
Scientific Periodicals. World List of (Periodical lists of Amendments to the third edition published in *Chemistry and Industry* by the Society of Chemical Industry), 102
Scientific Policy, Advisory Council on: Eighth Annual Report (1954–55), 365, *erratum*, 539
Scientific Problems in the Development of Electronic Devices · Summer School for University and Technical College Teachers on (Admiralty), 102
Scientific Radio Union, International: Proceedings of the Eleventh General Assembly (Dr. R. L. Smith-Rose), 451
  Special Report No. 3, Discrete Sources of Extra-Terrestrial Radio Noise; Special Report No 4, The Distribution of Radio Brightness on the Solar Disk; Special Report No. 5, Interstellar Hydrogen, 1110
Scientific Research: Cinematography in (Scientific and Technical Group of the Royal Photographic Society Discussion on), 726
  The WennerGren International Centre for, 1196
Scientific Research in Central Africa, Institute for. Report for 1952, 387
  *Folia Scientifica Africae Centralis*, Vol. 1, No. 1, 630
Scientific Research in India (Sir Alfred Egerton), 492
Scientific Research in Russia (translation issued by the Department of Scientific and Industrial Research of a survey in *Priroda* of recent work), 14
Scientific Research at South African Universities: Register of Current, Vol. 3 (Council for Scientific and Industrial Research, Pretoria), 492
Scientific Research and Man-power in the United States, 543
Scientific Study of Plants (Prof H. E. Street), 1240
Scientific Unions, International Council of (Mixed Commission on the Ionosphere). Symposium on Solar Eclipses and the Ionosphere, 947
Scientific Workers (Naval): Sea-going Facilities for, 1247
Scientific Workers and Teachers in Great Britain: Shortage of, 192
Scientific and Industrial Research, Advisory Council for: Appointment of Prof. P. M. S. Blackett and H. Douglass as members, 677
Scientific and Industrial Research, Council of (India). Appointment of Prof. M. S. Thacker as director, 535
Scientific and Industrial Research, Council for (Pretoria). Register of Current Scientific Research at South African Universities, Vol. 3, 492
Scientific and Industrial Research, Department of: Translation of a survey in *Priroda* of recent Scientific Research in Russia, 14
  Establishment of a Colonial Road Research Section at the Road Research Laboratory, 56
  Report of the Water Pollution Research Board, with the Report of the Director of Water Pollution Research, for the Year 1954, 106
  Report of the Hydraulics Research Station, Wallingford, for 1954, 193
  National Physical Laboratory, Notes on Applied Science No. 9, Measurement of Pressure with the Mercury Barometer, 193
  Symposium on Cavitation in Hydrodynamics, at the National Physical Laboratory, 195, 381, 808
  Names of the Committee investigating the work of the, 239
  Chemical Research Laboratory, Teddington—Open Days, 241, 857
  Forest Products Research Laboratory, Bulletin No. 32, Field Tests on Wood Preservatives used for Pressure Treatment (D. N. Smith), 248, Bulletin No. 33, The Strength Properties of Plywood, Part 2, Effect of the Geometry of Construction (W. T. Curry), 248
  Building Research Station, Garston, Watford—Open Days for Engineers, 337
  Report of the Chemistry Research Board, with the Report of the Director of the Chemical Research Laboratory, for the Year 1954, 382
  Retirement of E. Barnard as deputy secretary, 490
  National Physical Laboratory, Notes on Applied Science No. 8, Audio-Frequency Power Measurements, 492
  Road Research Laboratory, Technical Paper No. 34, Testing Concrete by an Ultrasonic Pulse Technique (Dr. R. Jones and E. N. Gatfield), 538
  Food Investigation Special Report No. 61, Scientific and Technological Problems involved in using Ionizing Radiations for the Preservation of Food (Dr. R. S. Hannan), 731
  National Physical Laboratory, Notes on Applied Science No. 10, Noise Measurement Techniques; No. 11, Wind Effects on Bridges and other Flexible Structures; No. 12, Calibration of Temperature-measuring Instruments, 822
  Report for the Year 1954 of the National Physical Laboratory, 866
  Appointment of Sir Walter Drummond and Prof N. F. Mott as visitors to the Electrical Research Association, 1056
  Appointment of Dr. R. S. Millard as head of the Colonial Section of the Road Research Laboratory, 1101
  Appointment of Dr. R. L. Smith-Rose as acting director of the National Physical Laboratory, 1200
Scientific and Industrial Research, Department of (New Zealand) · Bulletin 113, The Academic Record of Science Students in the University of New Zealand (I. D. Dick, R. M. Williams and Dermot Straker), 448
Scientific and Technical Books: Recent, Supp. vi, July 30; Supp. viii, August 27; Supp. viii, September 24; Supp. viii, October 29, Supp. viii, November 26; Supp. vi, December 31
Scientific and Technological Problems involved in using Ionizing Radiations for the Preservation of Food (Dr. R. S. Hannan), 731
Scientist: Science and the (Sir Robert Robinson), 433
Scientists: Social Responsibilities of (Prof. J. H. Hildebrand), 430
Scientists (British Atomic). Visit of, to the U.S.S.R., 954
Scientists (Russian): Visit of, to Britain (Arranged by the Royal Society and the Soviet Relations Committee of the British Council), 954
Scientists (Visiting), Society for: Annual Report for 1954–55, 908

Scorpion : Physiology of the Heart of a (M. S. Kanungo), 980
Scotland : Fresh-water Biology in (Scottish Branch of the Institute of Biology Conference on), 677
Scott, J. D. : Appointed conservator of forests, Sierra Leone, 910
Scott, Miss L. I. : Plant Anatomy Researches of I. W. Bailey, review, 709
Scott, Peter : Migration, 772
Scott, P. P., and Lloyd-Jacob, M. A. : Fertility, 340
Scott, R. P. W. : A New Detector for Vapour-Phase Partition Chromatography, 793
Scott, Dr. T. R. (McAndrew, Dr. J., and) : Stillwellite, a New Rare-Earth Mineral from Queensland, 509
Scottish Field Studies Association, 1102
Scrase, Dr. F. J. : Awarded by the Air Ministry with the L. G. Groves Memorial Prize for Meteorology, 768
Screw Thread (Unified) : Adoption of the, by British Industry (Conference at the British Standards Institution), 62
Scripps (Ellen Browning) Fellowship for 1955–56 awarded by the San Diego Zoological Society to Dr. Gordon W. Bellmer, 957
Sea : The Inexhaustible (Hawthorne Daniel and Francis Minot), *review* by Norman Holme, 478
  Radar and Phosphorescence at (Capt. Brett Hilder), 174
  Resources of the, *review* by Norman Holme, 478
Sea-serpent : An Uncollected Record of the Great (Denys W. Tucker), 705
Sea Transport and Trade : The Influence of the Engineer on (Dr. S. F. Dorey), 442
Sea Trout : 'Homing Instinct' in (W. M. Shearer), 171
Sea-going Facilities for Naval Scientific Workers, 1247
Seakins, J. W. T. (Hathway, Dr. D. E., and) : Autoxidation of Catechin, 218
Seals (Elephant) : Reproductive Organs of Foetal and Juvenile (W. Nigel Bonner), 982
Seamer, near Scarborough, Yorkshire : Excavations at Star Carr, an Early Mesolithic Site at (Prof. J. G. D. Clark), *review* by G. F. Mitchell, 91
Searle, Sidney A. (edited by) : Plant Climate and Irrigation, *review* by Prof. R. H. Stoughton, 992
Sears, W. R. (edited by) : General Theory of High Speed Aerodynamics, *review* by Prof. G. Temple, 479
Sears Foundation for Marine Research : Memoir No. 1, Fishes of the Western North Atlantic, Part 2, Sawfishes, Guitarfishes, Skates and Rays, Chimaeroids (Henry B. Bigelow and William C. Schroeder), *review* by Dr. G. A. Steven, 139
Seasonal Changes in Three Common Constituents of the Air Spora of Southern Nigeria (R. H. Cammack), 1270
Seaweed Research, Institute of (Dr. Kathleen M. Drew), 155
Seaweed Symposium : Second International (Dr. E. T. Dewar), 1106
Seaweeds : Chemical Composition of the Larger (D. J. Wort), 1198
Second Excited Singlet State of Benzene : Symmetry of the (T. M. Dunn and Prof. C. K. Ingold), 65
Second Pigment in Strawberries : Characterization of a (Dr. A. Lukton, Dr. C. O. Chichester and Prof. G. Mackinney), 790
Second of Time : An Atomic Standard of Frequency and Time Interval—Definition of the (Sir Edward Bullard), 282, erratum, 381
  Definition of the (Sir H. Spencer Jones), 669 ; (Dr. G. M. Clemence), 1230
Secondary Expansion of Perlite Concrete and Plaster (R. D. Hill), 29
Secondary Schools, with Special Reference to Grammar Schools : The Teaching and Learning of Biology in (Prof. L. T. Green), second edition, *review* by Dr. W. L. Sumner, 570
Secretary of State for the Colonies : Appointment of a Committee to advise on matters of Road Research for the benefit of the Colonies, 56
Secretion of a Highly Sulphated Acid Mucopolysaccharide by the Brittle-star, *Ophiocomina nigra* (A. R. Fontaine), 606
Secretion of the Pitcher Plant : Chloride Ions in the (Shelagh Morrissey), 1220
Security Regulations and the Civil Service, 1233
Seddon, H. J. : Appointed a member of the Medical Research Council, 725
Sediments from the Colorado Plateau : Palaeomagnetism of (Dr. S. K. Runcorn), 505
Seedlings (Oat) : Liberation of Amino-Acids by (Dennis Parkinson), 35
Seeds : Reduction in X-Ray Sensitivity of, by Hydration (Richard S. Caldecott), 306
Seekles, Dr. L. : Animal Production from Grass, 729
Seel, Prof. F. : Grundlagen der analytischen Chemie und der Chemie in wässerigen Systemen, *review* by Dr. Albert Wassermann, 1137
Seeley, R. C. : Plant Growth Substances, 530
Seeley, R. C., and others : Alpha-Oxidation of Omega-(2 : 4-Dichlorophenoxy)alkanenitriles and 3-Indolylacetonitrile within Plant Tissues, 1026
Segnit, Prof. E. R. (Cassidy, W. A., and) : Liquid Immiscibility in a Silicate Melt, 305
Segrove, H. D., and others : Adsorption of Methylene Blue by High-Silica Sands, 1025
Seifert, G. L. (Wood, Dr. H. C., and) : Use of Seaweed Meals in Human and Animal Nutrition, 1107
Seismic Energy : A Coal Seam as a Guide for (Dr. F. F. Evison), 1224
Seismicity of the Earth and Associated Phenomena (B. Gutenberg and C. F. Richter), second edition, *review* by Ernest Tillotson, 617
Seismological Investigations, Committee for : Sixtieth Annual Report (1954–55), 679
Seismology : An Introduction to the Theory of (Prof. K. E. Bullen), second edition, *review* by Dr. R. Stoneley, 992
Seismology (British), during 1954–55 (Ernest Tillotson), 679
Selective Adaptation : Colour Anomaly, the Rayleigh Equation and (R. L. Gregory), 172
Selective Digestion of the Neurosecretory Material of the Hypothalamus and of the Neurohypophysis by Tissue Homogenates (A. Bereson, W. A. Hadler and J. H. Tramezzani), 600
Selenium : Fixation of Iodine in (R. A. Hyman and Dr. D. H. Tomlin), 977
*Selenomonas* (von Prowazek) : Taxonomic Position of the Genus (M. H. Jeynes), 1077
Selensky, W. D. : Zoological Publications of, 15
Selényi, P. (herausgegeben von) : Roland Eötvös, Gesammelte Arbeiten, *review* by Sir Edward Bullard, 228
'Self-Cure' in Nematode Infestations of Sheep (Dr. D. F. Stewart), 1273
Self-Inhibition in Germinating Rust Uredospores (F. R. Forsyth), 1103
Seligman, Dr. Henry : Peaceful Uses of Atomic Energy—Radioisotopes in Chemistry, Technology and Industry, 854
Sellers, Dr. K. C. : Appointed director of the Animal Health Trust new Farm Livestock Research Station at Stock, Essex, 583 ; work of, 583
Sellers, R. F. : Growth and Titration of the Viruses of Foot-and-Mouth Disease and Vesicular Stomatitis in Kidney Monolayer Tissue Cultures, 547
Selwood, A. : Awarded a postgraduate research scholarship (second-year renewal) by Courtaulds' Scientific and Educational Trust Fund, 770
Selwyn, E. W. H. : Theory of Lenses, *review* by G. R. Noakes, 1137
Semantics (British Association for the Advancement of Science, Section J (Psychology), Symposium on), 673
Semen : Enzymatic Coagulation of (G. Gotterer, D. Ginsberg, T. Schulman, Julia Banks and Dr. H. G. Williams-Ashman), 1209
Semiconductors : Chemical Aspects of (Royal Institute of Chemistry Symposium on), 153
  Intermetallic (Symposium at the Services Electronics Research Laboratory, Baldock), 341
Semiconductors and Transistors—some Current Problems (Dr. J. R. Tillman), 9
Sen, J. : A *Glossopteris* bearing Sori-like Structures, 742
Senescent Leaves : Acceleration of Abscission by a Factor produced in (Daphne J. Osborne), 1161, erratum, 1200
Sensitivity of Alpha- and Beta-Lead Azide (Peter Gray and T. C. Waddington), 653
Sensory Pathway (Dr. R. S. Creed), 443
Sensory Perception : Receptors and (Dr. Ragnar Granit), *review* by the Rt. Hon. Lord Adrian, 847
Separation of Ehrlich Ascites Tumour Cells from other Cellular Elements (Prof. Per Eric Lindahl and George Klein), 401
Separation within the Homologous Series of *n*-Alkyl Sulphates, *n*-Alkyl Pyridium and *n*-Alkyl Trimethyl Ammonium Halides by Paper Chromatography (H. Holness and W. R. Stone), 604
Separation of Ions at Crystallization of Water (R. Brill and H. Ender), 925
Separation of Rare-Earth Elements (Dr. M. Lederer), 462
Separation (Quantitative), of B Vitamins by Electrophoresis on Agar Plates (Dr. G. Marten), 1064
Separation and Identification of Phenols by Paper Chromatography (J. Green and S. Marcinkiewicz), 1172
Septate Wood Fibres in *Pithecolobium dulce* Benth. : Size Variations of (E. Govindarajalu and Prof. B. G. L. Swamy), 315
Sequences : Serially Balanced (Dr. D. J. Finney and Anne D. Outhwaite), 748
Serial Reaction Time in Man : Effect of Heat Stress on (D. C. Fraser and K. F. Jackson), 976
Serially Balanced Sequences (Dr. D. J. Finney and Anne D. Outhwaite), 748
Sermonti, Dr. G., and Spada-Sermonti, I. : Genetic Recombination in *Streptomyces*, 121
Serum : A Technique for Studying the *in vitro* Effect of, on Activated Taenioid Hexacanth Embryos (Paul H. Silverman), 598
Serum (Human) : Inhibition of Acyl Trypsins by (Dr. M. Bier, J. Sri Ram and Prof. F. F. Nord), 789
Serum Albumin (Bovine), in Urea Solution : Molecular Weight of Ovalbumin and of (H. A. McKenzie, M. B. Smith and R. G. Wake), 738
Serum Proteins in Normal Humans : Genetic Control of some (Dr. O. Smithies and Dr. Norma Ford Walker), 1265
Service : The Spirit of, and the Welfare State, 987
Service of Geology : Isotopes in the, *review* by Prof. Arthur Holmes, 1038
Services Electronics Research Laboratory, Baldock : Symposium on Intermetallic Semiconductors, 341
  Summer School on the Role of the Trained Scientist in the Design of Electronic Devices for Production, 1059
Seshachar, B. R., and Nambiar, Miss Parvathi K. : Effects of Carbon Tetrachloride on Mitosis, 796
Seshadri, Prof. T. R. : Chemistry of Naturally Occurring Pyrones, 637
Sewell, P. R. : Awarded a postgraduate research scholarship (renewal) by Courtaulds' Scientific and Educational Trust Fund, 770
Shah, Dr. Riaz Ali : Tuberculosis as a Problem of Different Races, 245
Shain, C. A. : Location on Jupiter of a Source of Radio Noise, 836
Shantz, E. M., and others : Growth Factors and Tumorous Growth in Coconut Milk, 537
Shape of the Earth (G. Tiercy), 1004
Sharland, T. R., and others : Production of Diphtheria Toxin in Submerged Culture, 1128
Sharma, A. K., and Sarkar, S. K. : A New Technique for the Study of Chromosomes of Palms, 261
Sharmer, Surendra, and Tiku, P. N. : Venous System of *Rana tigrina* Daud., 335
Sharp, Dr. L. W. : The Function of Libraries, 1253
Shaw, Prof. F. H., and Simon, Shirley E. : Sodium Extrusion in Muscle, 1031
Shaw, L. G. (Hancock, Dr. J. L., and) : A New Difference between Live and Dead Spermatozoa, 260
Shearer, W. M. : 'Homing Instinct' in Sea Trout, 171
Shedding in Cotton : Correlation between Cloud Shade and (Alan Goodman), 39
Sheep : Genetic Control of Sodium and Potassium Concentrations in the Red Blood Cells of (J. V. Evans and J. W. B. King), 171
  'Self-Cure' in Nematode Infestations of (Dr. D. F. Stewart), 1273
  Site of Phosphorus Absorption in the (Evan Wright), 351
Sheep and Goat : Variations in the Direction of Venous Blood-flow in the Mammary Region of the (J. L. Linzell and L. E. Mount), 37
Sheffield Interchange Organization : Work during 1954–55, 816
Shelbourne, J. E. : Significance of the Subdermal Space in Pelagic Fish Embryos and Larvae, 743
Sheld-Duck in Germany : Preservation of the, 769
Sheldon, R. R. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 770
Shell Petroleum Co., Ltd., and others : Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
Shepherd, Dr. D. M., and others : Function of Heparin, 1123
Sheppard, N. : Advances in Molecular Spectroscopy, 681
Sheppard, Prof. P. A. : Weather of the Tropics, *review*, 989
Shercliff, Dr. J. A. : Magneto-Hydrodynamics, 236

Sherris, Dr. J. C. (Preston, Dr. N. W., and): Factors Influencing the Motility of a Strain of *Pseudomonas viscosa*, 1220
Shetelig, Prof. Haakon: Obituary by Prof. Grahame Clark, 582
Shewan, J. M., and Liston, J.: Food Microbiology and Public Health, 374
Shillibeer, Dr. H. A., and others: Potassium—Argon Ages of some Lewisian and Fennoscandian Pegmatites, 390
Shilling, Dr. W. G.: *Obituary* by H. J. Curnow, 1196
Shimizu, I. (Oku, Prof. M., and): Chemistry of Wool, 713
Shipbuilding: The Use and Welding of Aluminium in (Institute of Welding, the British Welding Research Association, the Institution of Naval Architects, the British Shipbuilding Research Association and the Aluminium Development Association Symposium on), 957
Shipbuilding Research Association (British), and others: Symposium on the Use and Welding of Aluminium in Shipbuilding, 957
Shirras, Prof. G. F.: *Obituary* by Dr. John Murray, 376
Shock (Anaphylactic, Peptone and Tryptic): Release of Histamine in Hepatectomized Dogs during (H. Moussatché) 648
Shoenberg, Dr. D.: Low-Temperature Physics, *review*, 322
Shore-lines: Glacial (Dr. P. B. McFarlane), 213
Shorland, Dr. F. B., and Jessop, A. S.: Isolation of $\Delta^9$ Heptadecenoic Acid from Lamb Caul Fat, 737
Shorland, Dr. F. B., and others: Occurrence of *n*-Nonadecanoic Acid in Ox Perinephric Fat, 882
Shorrock, R. W.: Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Short-day Treatment: Ear Formation in Timothy Grass (*Phleum pratense*) following Vernalization and (Dr. R. H. M. Langer), 263
Shortage of Scientific Workers and Teachers in Great Britain, 192
Shower Curves (Cosmic-Ray), for Lead: Anomalies in the (Prof. Rafi Mohammed Chaudhri, Abdul Qayyum and Afzal Farooqi), 876
Shrimpton, Dr. D. H.: Biological and Microbiological Methods of Estimating Vitamin $B_{12}$, 384
Shumilovskii, N. N.: Automation in the Soviet Union, 294
Shute, P. G.: Myxomatosis, 1155
Sialic Acid, Neuraminic Acid and 2-Carboxy-Pyrrole: Structural Relationship between (Dr. A. Gottschalk), 881
Siberia and North America: Hair Embroidery in (Geoffrey Turner), 724
Sickle Cell Gene Distribution (Prof. S. C. Harland), 963
Side-Chain Orientation in Fibrous Proteins (Dr. R. D. B. Fraser), 358
Sidrak, G. H. (Rees, Dr. W. J., and): Plant Growth on 'Fly Ash', 352
Sieff (Daniel) Research Institute: Retirement of Dr. Esther Hellinger as chief mycologist and bacteriologist, 1003
Siegbahn, Prof. Kai (edited by): Beta- and Gamma-Ray Spectroscopy, *review* by Prof. M. H. L. Pryce, 414
Sieve Plates in *Cucurbita*: Electron Microscopic Observations on the Structure of the (C. E. L. Hepton, Prof. R. D. Preston and G. W. Ripley), 868
Siforov, Prof. V.: Information Theory, 774
Significance of Glutamic Acid in Metabolic Processes in the Rat Brain during Physical Exercise (Dr. R. Vrba), 1258
Significance of the Subdermal Space in Pelagic Fish Embryos and Larvae (J. E. Shelbourne), 743
Sijpesteijn, Dr. A. Kaars, and others: A New Type of Plant Growth-regulating Substances, 308
Silberberg, A., and others: Negative Thixotropy of Aqueous Solutions of Polymethacrylic Acid, 1119
Silica (High-) Sands: Adsorption of Methylene Blue by (G. Mitchell, P. Poole and H. D. Segrove), 1025
Silicate Melt: Liquid Immiscibility in a (W. A. Cassidy and Prof. E. R. Segnit), 305
Silicate Thesaurus, *review* by Dr. R. C. Mackenzie, 47
Silicate: The Physical Chemistry of the (Wilhelm Eitel), *review* by Dr. R. C. Mackenzie, 47
Silicates (Vitreous): Structure in, as shown by Low-angle Scattering of X-Rays (L. C. Hoffman and W. O. Statton), 561
Silicon: Radioactivation Analysis of Phosphorus in (J. A. James and D. H. Richards), 1026
Siliprandi, N., and others: Action of Insulin on Thiamine Phosphorylation *in vitro*, 219
Silkworm, *Bombyx mori* L.: Studies on Transaminase and Decarboxylase Catalysed by Extracts of the (B. Bheemeswar), 555
Silliman (Mrs. Hepsa Ely) Memorial Lectures, *review* by the Rt. Hon. Lord Adrian, 847
Silva, V. M., and others: Anti-tumorigenic Action of Iodinated Compounds, 466
Silver, $^{111}_{47}$Ag (Radioactive): Nuclear Spin and Hyperfine Structure of (G. K. Woodgate and R. W. Hellwarth), 395
Silver Chromate: Crystallization of (Miss J. R. Howard and Dr. G. H. Nancollas), 833
Silver Jubilee Commemoration Award of the Illuminating Engineering Society awarded to K. R. Ackerman, 724
Silver Technique (Glees): Use of the, in the Hypothalamus (W. M. Cowan and T. P. S. Powell), 1124
Silverleaf, A.: Cavitation in Hydrodynamics, 808
Silverman, Paul H.: A Technique for Studying the *in vitro* Effect of Serum on Activated Taeniid Hexacanth Embryos, 598
Silverman, S.: Advances in Molecular Spectroscopy, 681
Simey, Prof. T. S.: The Problem of Race, *review*, 416
Simmonds, Dr. D. H.: Chemistry of Wool, 713
Simms, Eric: The Language of Birds and other Animals, 677
Simon, Sir Francis: Guthrie Lecture for 1956 of the Physical Society, 241
Simon, Shirley E. (Shaw, Prof. F. H., and): Sodium Extrusion in Muscle, 1031
Simons, E. G. L., and others: Metabolism of Triaryl Phosphates in Rodents, 259
Simplified Method of preparing Pure Mono-, Di- and Tri-glycerides (L. Hartman), 1024
Simpson, George Gaylord: Phenacolemuridae, 501
Simpson, J. R.: Appointed chemist, Agricultural Department, Uganda, 539
Simpson, J. S.: Microbiological Assay of Antibiotics, 730
Simpson, Mrs. S. A., and others: Use of Radioactive Materials in Biological Assay, 428
Simpson, Dr. T. H.: Chemistry of Naturally Occurring Pyrones, 637
*Simulium ornatum* Mg.: Behaviour of Young and Old Females of the Black-fly (L. Davies), 979
Simultaneous Administration of Gonadotrophic Hormones: Modification of Response to Adrenocorticotrophic Hormone by the (Barbara E. Clayton and Joyce E. Hammant), 401
Singer, Charles, and others (edited by): A History of Technology, Vol. 1, From Early Times to Fall of Ancient Empires, *review* by Dr. Friedrich Klemm, 182
Singer, Dr. S. J. (Rees, Dr. E. Douglas, and): Molecular Weight of Insulin in N,N-Dimethylformamide, 1072
Singh, Dalbir: Cytoplasmic Nodules in the Endosperm of some Cucurbitaceae, 607
Singh, Rama Shankar (Asundi, Prof. R. K., and): Absorption Spectrum of Benzoquinone, 1223
Single Crystals of Alkali Halides: Electrical Effects associated with the Mechanical Deformation of (J. E. Caffyn and T. L. Goodfellow), 878
Single-Breath Continuous Carbon Dioxide Analysis (L. Feinmann, G. L. Leathart and G. B. Pendlenton), 739
Singlet State of Benzene (Second Excited): Symmetry of the (T. M. Dunn and Prof. C. K. Ingold), 65
Siniscalco, Dr. M.: Fitness of Microcythaemics—a Correction, 84
Sinus Venosus of the Frog's Heart: Effect of Vagal Stimulation on the (Dr. O. F. Hutter and Dr. W. Trautwein), 512
Sircar, Dr. S. M., and Kundu, Maya: Effect of Auxins on the Flowering Behaviour of Rice, 840
Sirks, M. J.: Problems of International Concern in the Biological Sciences, 242
Sistrom, Dr. W. R., and others: Function of Carotenoids in Photosynthesis, 1211
*Sisymbrium irio* Complex: Biosystematics of the (T. N. Khoshoo), 608
Site of Inhibition of Trypsin by Diethyl *p*-Nitrophenylphosphonate (T. Viswanatha and I. E. Liener), 1120
Site of Phosphorus Absorption in the Sheep (Evan Wright), 351
Sites for Oxidative Phosphorylation: A Method for the Localization of (Dr. Britton Chance and Dr. G. R. Williams), 250
Six: One in—an Outline of the Cancer Problem (Dr. I. Hieger), *review* by Prof. H. N. Green, 941
Size of Deoxypentose Nucleic Acids: Macromolecular Weight and (Geoffrey L. Brown, Dr. Marjorie B. M'Ewen and Margaret I. Pratt), 161
Size Variations of Septate Wood Fibres in *Pithecolobium dulce* Benth. (E. Govindarajalu and Prof. B. G. L. Swamy), 315
Sizer, I. W., and Gierer, A.: Physical Chemistry of Enzymes, 959
Sizing of Particles with the Flying-Spot Microscope: Counting and (D. Causley and Prof. J. Z. Young), 453
Sizoo, G. J., and others (edited by Kronig, R., in collaboration with): Textbook of Physics (translated from the third Dutch edition), *review* by Prof. G. O. Jones, 184
Skaf, R.: The Desert Locust Problem, 591
Skellam, J. G.: Estimation of Numbers of Locusts, 590
Skene, Prof. M.: Metabolism of Nitrogen in Plants, 904
Skew-ray Tracing: Ultra High-speed (Dr. Gordon Black), 27
Skilled Manpower: A Policy for (National Manpower Council), 43
Skin Graft (Experimental): Influence of Cortisone on Connective Tissue—Epithelial Relations in Wound Healing, Hair Regeneration and the Pathogenesis of (Prof. Theodore Gillman, Jack Penn, Doris Brooks and Marie Roux), 932
Skinner, Prof. H. W. B.: The Teaching of Modern Physics, *review*, 942
Skis (Fast-Running): Some Recent Experiments in Friction—Friction on Snow and Ice and the Development of some (Dr. F. P. Bowden), 946
Skott, P. A.: Appointed assistant conservator of forests, Tanganyika, 910
Skull (Swanscombe): A Further Fragment of the (J. Wymer), 426
Skull Bone (Human): Portion of a, discovered at Swanscombe by Mr. and Mrs. B. O. Wymer, J. Wymer and Adrian Gibson, 287
Skull Development in Chick Embryos after Ablation of One Eye (A. d'A. Bellairs), 658
Sky: The Night, in August, 195; in September, 381; in October, 632; in November, 817; in December, 1005; in January, 1249
Sky Atlas: The National Geographic Society—Palomar Observatory (Sir Harold Spencer Jones), 1148
Slater, D. J.: Appointed geologist, Federation of Malaya, 539
Slater, Prof. E. C.: Physical Chemistry of Enzymes, 959
Slater, Prof. E. C. (Tissières, Dr. A., and): Respiratory Chain Phosphorylation in Extracts of *Azotobacter vinelandii*, 736
Slater, Dr. E. T. O.: Genetics and Medicine, 532
Slater, Sir William: Address to the Fellows of the National Institute of Agricultural Botany, 287
Sledge, W. A. (Manton, Prof. I., and): Cytology and Taxonomy of Ceylon Pteridophyta, 631
Sleep, Major I. E.: Accuracy of a 1:25,000 Map made by Multiplex Equipment, 1057
Sleep, K. C.: Appointed scientific officer (chemist), Tanganyika, 910
Sleigh, M. A.: Animal Movement, 1060
Slifer, Dr. Eleanor H.: Appointed to a fellowship in zoology in the University of Birmingham, 1055
Slip (Flexural Rotational), as the Main Deformation Process in the Torsion of Zinc Crystals (A. D. Whapham and Dr. H. Wilman), 460
Sloley, R. W.: Babylonian Astronomy, *review*, 569
Slonimski, Dr. Piotr P. (Ephrussi, Prof. Boris, and): Yeast Mitochondria—Subcellular Units involved in the Synthesis of Respiratory Enzymes in Yeast, 1207
Slow Coagulation: Electrophoretic Measurement of the True Zeta-Potential of Arsenious Sulphide Sol in the Region of (Prof. B. N. Ghosh and K. C. Ray), 1080
Slow Disappearance of Fluorescence in Thionine on addition of Abietic Acid (Prof. Santi R. Palit and Byomkesh Biswas), 214
Smailes, Prof. A. E.: Title of professor of geography in the University of London conferred on, 957
Smales, A. A.: Chemical Aspects of Semiconductors, 154
Smart, F. J.: Appointed agricultural officer, Northern Rhodesia, 16
Smart, Dr. John: Black Flies of Guatemala, *review*, 1238
Smeathers, R.: Appointed conservator of forests, British Guiana, 539
Smeaton, W. A.: Further Studies of Lavoisier's Chemical Discoveries, *review*, 896
Smith, Dr. A.: Microfilaraemia in Rock Rabbits, 38

Smith, Audrey U., and others : Effects of Hypothermia on Behaviour, 1015
Smith, Charles : Awarded a postgraduate scholarship in husbandry by the Department of Agriculture for Scotland, 677
Smith, Dr. Cedric A. B. : Biomathematics, *review* by Prof. K. Mather, 1136
Smith, D. B., and Church, G. R. : A Method of Locating Interfaces in Oil Pipelines, 223
Smith, D. B., and others : Algal Chemistry, 1106
Smith, Dr. D. C. C. : Ester Groups in Lignin, 267
  Contribution of Residues containing Carbonyl to the Ultra-Violet Absorption of Lignins, 927
Smith, D. N. : Field Tests on Wood Preservatives used for Pressure Treatment (Forest Products Research, Bulletin No. 32), 248
Smith, Dr. E. Lester : Use of Radioactive Materials in Biological Assay, 428
Smith, Dr. E. Lester, and others : Structure of Vitamin $B_{12}$—The Structure of Vitamin $B_{12}$ and its Hexacarboxylic Acid Degradation Product, 328
  Physical Chemistry of Enzymes, 959
Smith, Prof. Emil L. : Lecture at the International Wool Textile Research Conference, Australia, 712
Smith, Prof. Emil L., and others : Principles of Biochemistry, *review* by Prof. D. C. Harrison, 276
Smith, F. R., and others : Antitubercular Effect of an Extract of *Adhatoda vasica*, 119
Smith, H. A. Stamers : Present State of Geodetic Triangulation in Nigeria, 1058
Smith, Dr. J. A. B. : Energy Value of Food, 152
Smith, Dr. J. C., and Tomlinson, Dr. M. L. *Obituary* of Dr. S. G. P. Plant, 628
Smith, Prof. J. L. B. : Live Coelacanths, 473
Smith, J. S. : Appointed conservator of forests, grade A, Federation of Malaya, 1248
Smith, Dr. Kenneth M. : Intranuclear Changes in the Polyhedrosis of *Tipula paludosa* (Diptera), 255
Smith, Dr. L. F. (Alexander, Dr. P., and) : Chemistry of Wool, 713
Smith, Margaret (Bach, Dr. S. J., and) : Role of Glutamine in Urea Synthesis, 1126
Smith, Muriel : Food Microbiology and Public Health, 373
Smith, M. B., and others . Molecular Weight of Ovalbumin and of Bovine Serum Albumin in Urea Solution, 738
Smith, Sir Rowland : Appointed a part-time member of the United Kingdom Atomic Energy Authority, 770
Smith, Dr. Ralph I. : Marine Biological Research, 109
Smith, S. : Dust and Health in Industry, 762
Smith, Dr. Stanley : *Obituary* by Dr. H. Dighton Thomas, 377
Smith, W. : Appointed senior agricultural officer, Gold Coast, 195
Smith, Prof. Wilfred : *Obituary* by Prof. E. G. Bowen, 767
Smith, Dr. W. Campbell : *Obituary* of Prof. Albert Michel-Lévy, 11
Smith-Rose, Dr. R. L. International Scientific Radio Union—Proceedings of the Eleventh General Assembly, 451
  *Obituary* of H. L. Kirke, 813
  International Research in Radio Astronomy, 1110
  Appointed acting director of the National Physical Laboratory, 1200
Smithies, Dr. O., and Walker, Dr. Norma Ford : Genetic Control of some Serum Proteins in Normal Humans, 1265
Smithsonian Institution, Washington · Miscellaneous Collections, Vol. 125, No. 1, The Black Flies (Diptera, Simuliidae) of Guatemala and their Role as Vectors of Onchocerciasis (Herbert T. Dalmat), *review* by Dr. John Smart, 1238
Smoke Abatement in Britain—Conference in Bournemouth (Prof. R. J. Sargant), 863
Smoke Abatement Society, National : *Smokeless Air*, Vol. 25, No. 94, 491
  Annual Conference, 863
Smoke Belt over London : Abnormal (N. G. Helliwell and M. J. Blackwell), 1248
*Smokeless Air*, Vol. 25, No. 94, 491
Snail : Apparent Resistance of a, to Infection in the Gold Coast (Fergus S. McCullough), 981
Sneath, Mrs. Joan S., and Sneath, P. H. A. : Transformation of the *Lewis* Groups of Human Red Cells, 172
Sneath, P. H. A. (Sneath, Mrs. Joan S., and): Transformation of the *Lewis* Groups of Human Red Cells, 172
Sneed, Prof. M. Cannon, and others (edited by) : Comprehensive Inorganic Chemistry, Vol. 2, Copper, Silver, Gold (J. W. Laist) ; Vol. 3, The Halogens (Prof. Robert C. Brasted), *review* by H. A. C. McKay, 229
Snell, R. S., and McIntyre, N. : Effect of Denervation on the Histochemical Appearance of Cholinesterase at the Myoneural Junction, 884
Snow and Ice : Some Recent Experiments in Friction—Friction on, and the Development of some Fast-Running Skis (Dr. F. P. Bowden), 946
Snowdonia : Ecology of—Ecology of Livestock Productivity (R. Elfyn Hughes), 595 ; Wild White Clover in Natural Mountain Grassland (A. D. Bradshaw and Tom Pritchard), 596
So-called Endosperm Embryos in *Ipomoea arborea* Nutt (Prof. P. Maheshwari and R. C. Sachar), 470
Social Behaviour in Rhesus Monkeys (Film by M. R. A. Chance), 341
Social Change in Tropical Areas : Education and (Prof. Margaret Read), *review* by R. Brightman, 757
Social Development in the Colonies : Education and, *review* by R. Brightman, 757
Social Foundations of Wage Policy (Barbara Wootton), *review* by Dr. N. S. Ross, 183
Social Implications of Automatic Control in Industry, 133
Social Medicine at Oxford (Dr. Roy M. Acheson), 57
Social Pressure : Opinions and (Dr. Solomon E. Asch), 1009
Social Progress : Voluntary Organizations and (Lady Morris), 987
Social Responsibilities of Scientists (Prof. J. H. Hildebrand), 430
Sociedade Brasileira para o Progresso da Ciência : Seventh Annual Meeting, 544
Società Lombarda di Scienze Mediche e Biologiche : Symposium on Heparin, 1005
Société de Chimie Physique : Fifth Annual Meeting (Chemical Effects of Ionizing Radiation), 197
Société Française de Métallurgie : Annual 'Journées Métallurgiques d'Automne', 288
Societies : Cells and (Prof. John Tyler Bonner), *review* by C. W. W., 992
Society : The Temple of Nature, or the Origin of (Erasmus Darwin), (in Russian), *review* by Dr. S. I. Tomkeieff, 711
Soding, Prof. Hans : Plant Growth Substances, 530
Sodium in Empty Ether Bottles (D. Rainy Brown), 448
Sodium Deoxyribonucleate : Effects of Gamma-Rays on Solutions of—Possible Chemical Mechanism for their Biological Effects (R. A. Cox, Dr. W. G. Overend, Dr. A. R. Peacocke and S. Wilson), 919
Sodium Excretion : Effect of Isolated Cerebral Hypoxia and Hypercapnia on (M. Foldi, A. G. B. Kovách and L. Takács), 120
Sodium Extrusion in Muscle (Prof. F. H. Shaw and Shirley E. Simon), 1031
Sodium and Potassium Concentrations in the Red Blood Cells of Sheep : Genetic Control of (J. V. Evans and J. W. B. King), 171
Sohonie, Prof. Kamala, and Ambe, K. S. . Crystalline Inhibitors of Trypsin from Potato, 972
Soil : Isolation of Ectotrophic Mycorrhizal Mycelia from Rhizomorphs present in (Dr. Ida Levisohn), 519
Soil under Field Conditions : Evaporation of Water from (G. Stanhill), 62
Soil (Australian) . Isolation of *Microsporum gypseum* and of *Keratinomyces ajelloi* from (E. B. Durie and Dr. D. Frey), 936
Soil and the Rumen : Xylanase in the (H. Sorensen), 74
Soil Mechanics, Geology and Civil Engineering (British Association for the Advancement of Science, Sections C (Geology) and G (Engineering), Symposium on), 715
Soil-Moisture Deficit : An Instrument for Measuring (G. Stanhill and R. J. Winter), 1276
Soil Survey of Great Britain · Memoir on Soils of the Glastonbury District of Somerset (B. W. Avery), 147
Soils of the Glastonbury District of Somerset (B. W. Avery), 147
*Solanum* : Overcoming Cross-incompatibility among some Mexican Diploid Species of (Dr. M. S. Swaminathan), 887
Solar Disk : The Distribution of Radio Brightness on the (International Scientific Radio Union, Special Report No. 4), 1110
Solar Eclipses : Variation of *f*Es during (W. Stoffregen), 610
Solar Eclipses and the Ionosphere (Mixed Commission on the Ionosphere of the International Council of Scientific Unions Symposium on), 947
Solar Energy Research : Applied (edited by E. J. Burda), *review* by Dr. H. Heywood, 804
Solar Limb : Brightening of the, in the Far Ultra-Violet (C. M. Minnis), 652
Solar Physics, *review* by Dr. A. Hunter, 5
Solar Radiation during the Eclipse of the Sun on June 30, 1954 : Observations of the (R. Dogniaux), 1103
Solar System : On the Origin of the (Prof. H. Alfvén), *review* by Thomas Gold, 274
Solid State : Theory of the, *review* by Prof. H. Fröhlich, 479
Solid-Liquid Equilibrium Diagram of Argon and Krypton (R. Heastie), 747
Solids : Determination of Elastic Constants of, by Ultrasonic Diffraction Methods (Dr. G. S. Verma), 27
  Quantum Theory of (Prof. R. E. Peierls), *review* by Prof. H. Frohlich, 479
  Some Recent Experiments in Friction—Friction of, at High Speeds (Dr. F. P. Bowden and E. H. Freitag), 944
Solids at Room Temperature . Photochemical Processes in (Roger A. Ford), 1023
Solids (Crystalline) : Vacant Lattice Sites in (Prof. N. F. Mott), 439
Soluble Feather Keratin : The Free Amino-Groups of (A. M. Woodin), 1117
Solution · A Correlation between the Rates of Unimolecular Pyrolysis of Alkyl Halides in the Gaseous Phase and $S_N1$ Rates in (Dr. Allan Maccoll and Dr. P. J. Thomas), 392
Solutions : Radiation Chemistry of (M. Ebert and P. Howard-Flanders), 197
Solutions of Anthracene in *n*-Hexane : Radiolysis of Liquid *n*-Hexane and (Dr. F. H. Krenz), 1113
Solutions of Sodium Deoxyribonucleate: Effects of Gamma-Rays on—Possible Chemical Mechanism for their Biological Effects (R. A. Cox, Dr. W. G. Overend, Dr. A. R. Peacocke and S. Wilson), 919
Solutions (Aqueous), of Polymethacrylic Acid : Negative Thixotropy of (J. Eliassaf, A. Silberberg and Prof. A. Katchalsky), 1119
Solvents for Spectroscopic Purposes (Photoelectric Spectrometry Group survey of the demand for), 381
Somerset : Soils of the Glastonbury District of (B. W. Avery), 147
Sommerfeld, Arnold · Optics (translated by Otto Laporte and Peter A. Moldauer), *review* by Prof. R. E. Peierls, 850
Sorensen, H. : Xylanase in the Soil and the Rumen, 74
Sorensen, Prof. N. A. (Lunsen, S., and) : Algal Chemistry, 1106

Structure of a Scale between the Atomic and Microscopic Dimensions (International Union of Crystallography Symposium on), 1153
Structure of the Sieve Plates in *Cucurbita* . Electron Microscopic Observations on the (C. E. L. Hepton, Prof. R. D. Preston and G. W. Ripley), 868
Structure of Sterculic Acid (J. P. Verma, Bhola Nath and Dr. J. S. Aggarwal), 1082
Structure of Sterculic Acid and other Analogous Fatty Acids (G. Dijkstra and H. J. Duin), 71
Structure of Vitamin $B_{12}$—The Crystal Structure of the Hexacarboxylic Acid derived from $B_{12}$ and the Molecular Structure of the Vitamin (Dr. Dorothy Crowfoot Hodgkin, Jenny Pickworth, John H. Robertson, Prof. Kenneth N. Trueblood, Richard J. Prosen and John G. White), 325 ; The Structure of Vitamin $B_{12}$ and its Hexacarboxylic Acid Degradation Product (R. Bonnett, Dr. J. R. Cannon, Dr. A. W. Johnson, I. Sutherland, Sir Alexander Todd and Dr. E. Lester Smith), 328
Structure of Vitamin $B_{12}$ and its Hexacarboxylic Acid Degradation Product : Structure of Vitamin $B_{12}$—The (R. Bonnett, Dr. J. R. Cannon, Dr. A. W. Johnson, I. Sutherland, Sir Alexander Todd and Dr. E. Lester Smith), 328
Structure in Vitreous Silicates as shown by Low-angle Scattering of X-Rays (L. C. Hoffman and W. O. Statton), 561
Structure (Fine), of Cellulose and other Microfibrillar Substances (V. Balashov and Prof. R. D. Preston), 64
Structure (Hyperfine), of Radioactive Silver, $^{111}_{47}$Ag. : Nuclear Spin and (G. K. Woodgate and R. W. Hellwarth), 395
Structure (Stereochemical), of Cytochrome *c* (Anders Ehrenberg and Prof. Hugo Theorell), 158
Structure and Swelling Properties of the Chloroplasts of *Nitella cristata* (F. V. Mercer, A. J. Hodge, A. B. Hope and J. D. McLean), 389
Structures : Correlation between Calculated and Observed Stresses and Displacements in (Institution of Civil Engineers Conference on), 149
Struve, Prof. Otto : Presidential Address to the International Astronomical Union, 626
Stuart, T. A. . Migration, 772
Students (Colonial), in Britain (Report by Political and Economic Planning), 320, 591
Students (Medical) : Physics for (Dr. J. S. Rogers), third edition, review by G. R. Noakes, 185
Students (Science) : The Academic Record of, in the University of New Zealand (L. D. Dick, R. M. Williams and Dermot Straker), 448
Students (Science), in New Zealand, 448
Students (Training College) · Report of the Working Party on Grants to (Ministry of Education), 295

Students' Premium for 1954 of the British Institution of Radio Engineers awarded to R. W. Walker, 536
Studentships: Senior (Royal Commission for the Exhibition of 1851 Awards), 58
Studio-Rhytmi Biologici, Societas pro: Fifth Congress on Biological Rhythm, 149
Study of Chromosomes of Palms: A New Technique for the (A. K. Sharma and S. K. Sarkar), 261
Study of Development and Growth, Society for · Symposium on the Dynamics of Growth Processes (edited by Edgar J. Boell), *review*, 46
Study of Fertility, Society for the: Annual Conference, 340
Study of Plants. The Scientific (Prof. H. E. Street), 1240
Study and Travel in the United States · Fellowships for (Commonwealth Fund), 725
Studying the *in vitro* Effect of Serum on Activated Taeniid Hexacanth Embryos · A Technique for (Paul H. Silverman), 598
Subcellular Units involved in the Synthesis of Respiratory Enzymes in Yeast: Yeast Mitochondria—(Prof. Boris Ephrussi and Dr. Piotr P. Slonimski), 1207
Subdermal Space in Pelagic Fish Embryos and Larvae: Significance of the (J. E. Shelbourne), 743
Subject Specialization and Co-operative Book Purchase in British Libraries (K. G. Hunt), 62
Submerged Culture Production of Diphtheria Toxin in (F. V. Linggood, A. C. Matthews, S. Pinfield, Dr. C. G. Pope and T. R. Sharland), 1128
Subramanian, D. (Lakshminarayanan, K., and). Is Fusaric Acid a Vivotoxin?, 697
Substituted Aromatic Molecules: Molecular Orbital Theory of the Relative Reactivities of, towards Radical Addition (H. H. Greenwood), 1024
Suction. A Method for Sampling Arthropods and Mollusca from Herbage by (Dr. C. G. Johnson, Dr. T. R. E. Southwood and Mrs. H. Entwistle), 559
Sudanese Forestry Division: Memoir No. 5, Forests of the Upper Nile Province, 1862–1950 (G. A. Booth), 15
Sugar-Beet: Interactions of Nitrogen, Phosphorus and Potassium on (G. N. Thorne), 344
Sugars · Use of Acid-Base Indicator for Quantitative Paper Chromatography of (K. J. Gardner), 929
Sugars (Radioactive) · Metabolism of (H. K. Porter and L. H. May), 107
Sulphate Synthesis (Chondroitin): Glutamine as an Accelerator of (Harry Bostrom, Lennart Rodén and Anders Vestermark), 601
Sulphated Acid Mucopolysaccharide · Secretion of a Highly, by the Brittle-star, *Ophiocomina nigra* (A. R. Fontaine), 606
Sulphates (Steroid Glucuronosides and): Paper Chromatography of (Marvin L. Lewbart and Dr. John J. Schneider), 1175
Sulphates (*n*-Alkyl), *n*-Alkyl Pyridium and *n*-Alkyl Trimethyl Ammonium Halides: Separation within the Homologous Series of, by Paper Chromatography (H. Holness and W. R. Stone), 604
Sulphonamide Bacteriostasis: Inhibition Steps in (H. R. Alimchandani and Dr. A. Sreenivasan), 702
Summer Courses (Council for the Promotion of Field Studies), 15
Summer School (Universities Federation for Animal Welfare), 195
Summer School on the Applications of Spectroscopy to Chemical Problems and on Intermolecular Forces and the Properties of Fluids (University of Cambridge), 1104
Summer School for University and Technical College Teachers on Scientific Problems in the Development of Electronic Devices (Admiralty), 102
Summerson, John · Museum Buildings as Architecture, 246
Sumner, Prof. James B. · *Death of*, 336; obituary by Dr. Alexander L. Dounce, 859
Sumner, Dr. W. L. · Biology in Schools, *review*, 570
Sun: The (edited by Prof. Gerard P. Kuiper), *review* by Dr. A. Hunter, 5
  Energy from the, *review* by Dr. H. Heywood, 804
Sun on June 30, 1954 Observations of the Solar Radiation during the Eclipse of the (R. Dogniaux), 1103
Sundaresan, P. R., and others: High-potency Vitamin $A_2$ Oils from Indian Freshwater Fish, 554
*Sunday Times* and *Research*: Science in Industry Essay Competition for 1955, 862
Sunde, L.: Use of Seaweed Meals in Human and Animal Nutrition, 1107
Sunde, I. (Jensen, A., and): Algal Chemistry, 1107
Sunflowers (*Helianthus annuus* L.): Rust Resistance in (Eric D. Putt and Dr. W. E. Sackston), 77
Sunlight: Effect of, on Mixtures of Vegetable Oils and Pigments (Prof. Frank A. Lee), 463
Sunner, Dr. S.: Strain in 6,8-Thioctic Acid, 217
Supervoltage Machines for X-Ray Therapy (Exhibition at the Science Museum, London), 379, *erratum*, 586
Supply, Ministry of: Promotion of Dr. W. B. Littler to chief scientific officer and appointment as principal director of scientific research (defence), 632
  Appointment of Dr. W. Cawood as principal director of scientific research (air), 632
  Gift of £935 to the Department of Chemical Engineering, University of Birmingham, for research on the low-temperature properties of esters; and £775 for research on the design of distillation towers, 1055
Supply, Ministry of (Armament Research and Development Establishment): Symposium on Plasticity of Materials, 544
Suppression of Stammering · Experiments on the Complete (Dr. E. Colin Cherry, B. McA. Sayers and Pauline M. Marland), 874
Supra-Sternal Ossicles in Primates other than Man (Prof. D. V. Davies), 1130
Supra-sternal Ossicles in Primates other than Man—some Isolated Cases in Gorilla and Chimpanzee (Dr. G. T. Ashley), 608
Surface Pigmentation in Animals Measurement of (A. J. Lee), 558
Surface Rheology (British Society of Rheology Conference on), 493
Surface Rheology—Annual Conference of the British Society of Rheology (Dr. E. W. J. Mardles), 819
Surfaces: Erosion of, by Liquid Drops (D. C. Jenkins), 303
Surgeons, Royal College of · Wellcome Museums opened by Sir Henry Dale, 1201
Surgery (Orthopaedic): Metallic Transfer in Drilling and its Significance in (Dr. F. P. Bowden, J. B. P. Williamson and P. G. Laing), 826
Surtees, G.: Appointed research entomologist, West African Council for Medical Research, Nigeria, 910
Survey of Cancer, *review* by Prof. H. N. Green, 941
Survey Officers (Commonwealth): Conference of (Brigadier G. Bomford), 1057
Survival in the Modern World: Reason and, 521
Surviving Uterine Segments: *In vitro* Stimulation of Incorporation of Formate-$^{14}$C in, by Hydroxylated Œstradiols (Dr. Gerald C. Mueller), 127
Sutcliffe, Dr. R. C.: Elected president of the Royal Meteorological Society, 16
  Large-scale Weather Processes, 724
Sutherland, Dr. C. L.: Dust and Health in Industry, 763
Sutherland, Prof. G. B. B. M.: Advances in Molecular Spectroscopy, 682
Sutherland, I., and others: Structure of Vitamin $B_{12}$—The Structure of Vitamin $B_{12}$ and its Hexacarboxylic Acid Degradation Product, 328
Sutton, Sir Graham: Weather Forecasting—the Future Outlook, 724, 993
Sutton, H. C.: Chemical Effects of Ionizing Radiation, 197
Svedelius, Prof. N. E.: Elected an Honorary Fellow of the Royal Society of Edinburgh, 56
Swain, Dr. T., and others: Chemistry and Inheritance of Flower Colour in the Dahlia, 1016
Swallow, Dr. A. J.: Chemical Effects of Ionizing Radiation, 197
  Progress in Radiobiology, 683
  Reduction of Riboflavin to a Stable Free Radical using X-Rays, 793
Swaminathan, Dr. M. S.: Overcoming Cross-Incompatibility among some Mexican Diploid Species of *Solanum*, 887
Swamy, Prof. B. G. L. (Govindarajalu, E., and): Size Variations of Septate Wood Fibres in *Pithecolobium dulce* Benth., 315
Swan, Dr. J. M.: Chemistry of Wool, 713
Swanscombe, Kent · New Discovery at, 287
Swanscombe Skull: A Further Fragment of the (J. Wymer), 426
Swamps (Tropical): Research on the Biology of (Grant of £21,900 from the Nuffield Foundation to Makerere College, Uganda, for), 536
Swarmers of *Rhizobium* and *Azotobacter*: Filterability of the (J. C. Lawrence), 1033
Swaziland · Economic Development of Basutoland, Bechuanaland and, 1158
Swedish Academy of Technical Sciences, Royal: IVA Grand Gold Medal conferred on Dr. K. H. Gustavson, 910
Sweet Potato infected with Black Rot: Respiratory Increase and Phosphorus and Nitrogen Metabolism in (Takashi Akazawa and Dr. Ikuzo Uritani), 1071
Swelling Properties of the Chloroplasts of *Nitella cristata*: Structure and (F. V. Mercer, A. J. Hodge, A. B. Hope and J. D. McLean), 389
Swift, Prof. H. W.: Title of emeritus professor of engineering in the University of Sheffield conferred on, 1056
Swine and Cattle in Denmark: Congenital Porphyria in (S. K. Jorgensen and Dr. Torben K. With), 156
Swiss Federal Institute of Technology, Zurich: Centenary celebrations, 539
Swiss Society for Natural Sciences: 135th Annual Meeting, 539
Switzerland: A Hundred Years of Technological Training and Research in (Prof. Max Wildi), 758
Swyer, G. I. M.: Human Fertility, 341
Sykes, Prof. J.: Land Use in Britain, 339
Sykes, J. H. M.: A Guide to Electricity, *review* by G. R. Noakes, 1089
Sykes, J. T.: Plant Growth Substances, 530
Sykes, Dr. K. W.: Appointed to the University of London chair of physical chemistry at Queen Mary College, 1248
Sykes, Dr. R. L. (French, Dr. M. H., and): The Effect of certain Drying Conditions on the Putrefaction of Cattle Hides and Goatskins, 297, 725
Sylvester Medal for 1955 of the Royal Society awarded to Prof. E. C. Titchmarsh, 907, 1094
Symmetry of the Second Excited Singlet State of Benzene (T. M. Dunn and Prof. C. K. Ingold), 65
Symmetry (Bilateral): Plane of, in Plant Cilia (Prof. I. Manton), 123
Symmetry (Pentagonal), in Nature (C. M. Breeder, jun.), 1159
Symonds, J. L. (Burcham, Prof. W. E., and): High-Energy Nuclear Physics, 373
Sympathomimetic Amines · Some Differences in the Effects of Different, on the Isolated Innervated Rat Diaphragm Preparation (Dr. Katharine A. Montagu), 738
Synchronized *Salmonella typhimurium* Cultures: Turbidimetric Measurement on (Dr. V. G. Bruce, K. G. Lark and O. Maaløe), 563
Synchrotron: The Glasgow 340-MeV. (Dr. W. McFarlane, S. E. Barden and Dr. D. L. Oldroyd), 666
Synergism in the Chemotherapy of *Eimeria tenella* (L. P. Joyner and S. Brian Kendall), 975
Synergists (DDT): A New Group of (Dr. Ernst D. Bergmann, A. S. Tahori, A. Kaluszyner and S. Reuter), 266
Synge, P. M., and Roper, Lanning (edited by): The Fruit Year Book, 1955, *review* by Dr. John Grainger, 322
Synge, Dr. R. L. M. · Chemistry of Wool, 713
Synnematin *B* Identity of Cephalosporin *N* and (Dr. E. P. Abraham, G. G. F. Newton, B. H. Olson, D. M. Schuurmans, J. R. Schenck, M. P. Hargie, M. W. Fisher and S. A. Fusari), 551
Synoptic Meteorology: Vacation Courses in (Royal Meteorological Society and the Council for the Promotion of Field Studies), 1248
Syntheses: Organic—Collective Vol. 3 (edited by E. C. Horning), revised edition of Annual Vols. 20–29, *review* by Prof. John Read, 573
Synthesis of Deoxyribonucleic Acid: Action of Ribonuclease on Living Cells *in vitro* and (H. Firket, S. Chèvremont-Comhaire and Prof. M. Chèvremont), 1075
Synthesis of (L) α-2,4-Dinitrophenylhistidine (L. K. Ramachandran and W. B. McConnell), 931
Synthesis of Respiratory Enzymes in Yeast: Yeast Mitochondria—Subcellular Units involved in the (Prof. Boris Ephrussi and Dr. Piotr P. Slonimski), 1207
Synthesis (Biochemical), and Isotopic Tracer Technique, 193
Synthesis (Chondroitin Sulphate). Glutamine as an Accelerator of (Harry Bostrom, Lennart Rodén and Anders Vestermark), 601
Synthesis (Enzymic), of a 'Branched' Trisaccharide (Dr. R. W. Bailey, Dr. S. A. Barker, Dr. E. J. Bourne and Prof. M. Stacey), 1164

Synthesis (Indole) : Effect of Antibiotics on, by *Escherichia coli* 7–4 (Dr. F. Gibson, Marjorie J. Jones and H. Teitscher), 164
Synthesis (Peptide Chain) : Role of Nucleic Acid and Enzymes in (Dr. Alexander L. Dounce, Martin Morrison and Kenneth J. Monty), 597
Synthesis (Protein), in Isolated Cell Nuclei (Dr. V. G. Allfrey, Dr. A. E. Mirsky and Syozo Osawa), 1042
Synthesis (Urea) : Role of Glutamine in (Dr. S. J. Bach and Margaret Smith), 1126
Synthesis and Properties of S-Alanyl Coenzyme A (Charles J. Stewart and Prof. Theodor Wieland), 316
Synthetic Detergents : Partition Chromatography of (F. Franks), 693
Synthetic Linear Polymers : Electron Microscopic Observation of Monolayers of (Taro Tachibana, Kiyoshi Inokuchi and Teiko Inokuchi), 1117
Syrian Hamster : Two New Mutations in the (Roy Robinson), 353
Systematic Position of the Euphausiacea (Dr. Isabella Gordon), 934
Systematic Position of *Lanthanotus* and the Affinities of the Anguinomorph Lizards (S. B. McDowell, Jun., and C. M. Bogert), 432
Systematic Zoology : Methods and Principles of (Ernst Mayr, Prof. E. Gorton Linsley and Prof. Robert L. Usinger), *review* by Dr. H. W. Parker, 711
Systematics Association : Meeting in Edinburgh, 676
Szollósy, Ervin, and others : Interference between Variants of Pseudorabies Virus demonstrable in Tissue Culture, 972

TABOR, Dr. D. : Non-Destructive Testing, 386
Tachibana, Taro, and others : Electron Microscopic Observation of Monolayers of Synthetic Linear Polymers, 1117
Tachistoscope : New High-speed Electronic (Prof. George Humphrey, P. G. M. Dawe and Bernard Mandell), 231
Täckholm, Vivi, and Drar, Mohammed : Flora of Egypt, Vol. 3, Angiospermae, part Monocotyledones, Liliaceae—Musaceae, 101
Tadpoles (*Rana pipiens*) : Deoxyribonucleic Acid Content of Nuclei in Tail Mesenchyme of (Jerome J. Freed and Elizabeth Ufford Green), 116
*Taenia saginata* : 'Kernechtrot' or Nuclear Fast Red in the Histochemical Detection of Calcareous Corpuscles in (A. B. Chowdhury, B. Dasgupta and H. N. Ray), 701
Taeniid Hexacanth Embryos : A Technique for Studying the *in vitro* Effect of Serum on Activated (Paul H. Silverman), 598
Tahori, A. S., and others : A New Group of DDT Synergists, 266
Tail Mesenchyme of *Rana pipiens* Tadpoles : Deoxyribonucleic Acid Content of Nuclei in (Jerome J. Freed and Elizabeth Ufford Green), 116
Tail Protein of Bacteriophage $T_4r+$ : Action of Complexes of the Zinc Group Metals on the (L. M. Kozloff and K. Henderson), 1169
Tait, Dr. J. F., and others : Use of Radioactive Materials in Biological Assay, 428
Takács, L., and others : Effect of Isolated Cerebral Hypoxia and Hypercapnia on Sodium Excretion, 120
Takeda, F., and others : Essential Relaxing Factor in Muscle other than Myokinase and Creatine Phosphokinase, 166
Tallantire, J. D. : Appointed principal agricultural officer, Federation of Nigeria, 910
Talley, Dr. R. M., and Stern, Dr. F. : Intermetallic Semiconductors, 342
Tannahill, T. R. : Star-Streaming from Stars of Spectral Types A and B, 155
Tanner, J. M., and Whitehouse, R. H. : A Caliper for Measuring Photographs, X-Rays and Drawings, 1180
Tanning Processes : The Fundamentals of the Chemistry of (Symposium at the Fourth Conference of the International Union of Leather Chemists' Societies), 587
Tansley, Sir Arthur : *Obituary* by Dr. H. Hamshaw Thomas, 1245
Tardigrades : Rate of Metabolism in, during Active Life and Anabiosis (A. Pigon and B. Weglarska), 121
Taste for Phenylthiocarbamide : Some Notably High Acuities of (Prof. J. W. H. Lugg), 313
Tata Memorial Trust : Resignation of Dr. F. H. K. Green from the secretaryship of the (European) Scientific Advisory Committee, 725
  Appointment of Dr. David Galton as secretary of the (European) Scientific Advisory Committee, 725
Taxonomic Position of the Genus *Selenomonas* (von Prowazek), (M. H. Jeynes), 1077
Taxonomy of Ceylon Pteridophyta : Cytology and (I. Manton and W. A. Sledge), 631
Taylor, Claude : Human Fertility, 341
Taylor, Dr. D., and Peacock, A. G. : Radio Isotope Instrumentation and Accessories, 1102
Taylor, D. P. : Appointed agricultural officer, Kenya, 910
Taylor, Dr. E : Practical Aspects of the Use of Insecticides and Fungicides in Agriculture and Horticulture, 1204
Taylor, E. W. : New Small Tavistock Theodolite, 1057
Taylor, F., and others : Alpha-Oxidation of Omega-(2 : 4-Dichlorophenoxy) alkanenitriles and 3-Indolylacetonitrile within Plant Tissues, 1026
Taylor, Dr. F. Sherwood : Functions of Museums in relation to Children and Science, 246
Taylor, Dr. George : Appointed a deputy chief scientific officer in the British Museum (Natural History), 908
Taylor, Prof. Howard F. : Appointed to the American Brake Shoe Company chair of foundry metallurgy at the Massachusetts Institute of Technology, 907 ; work of, 907
Taylor, H. S., and others (edited by) : Physical Measurements in Gas Dynamics and Combustion, *review* by Dr. A. G. Gaydon, 1043
Taylor, Joan : Food Microbiology and Public Health, 374
Taylor, John G. V., and others : Reliability of Atomic Masses in the Chromium–Germanium Region, 458
Taylor, J. H., and Gordon, W. S. : Growth-promoting Activity for Pigs of Inactivated Penicillin, 312
Taylor, Langley : Land Use in Britain, 339
Taylor, Dr. R. E. (Huxley, A. F., and) : Function of Krause's Membrane, 1068
Taylor, Dr. S. J. : Appointed lecturer in mathematics at the University of Birmingham, 862
Taylor, T. H. C. : Trends and Needs in Locust Research, 591
Taylor, W. K. : Information Theory, 774
Teachers (Scientific Workers and) : Shortage of, in Great Britain, 192
Teaching of Electricity, with special reference to the Use of M.K.S. Units (Science Masters' Association), *review* by Prof. L. F. Bates, 617
Teaching of M.K.S. Units, *review* by Prof. L. F. Bates, 617
Teaching of Modern Physics, *review* by Prof. H. W. B. Skinner, 942
Teaching and Learning of Biology in Secondary Schools, with Special Reference to Grammar Schools (Prof. L. T. Green), second edition, *review* by Dr. W. L. Sumner, 570
Tearing : Method of (Dr. Gabriel Kron), 632
Technical Age : Liberal Education in a (National Institute of Adult Education Report), 343
Technical Books : Recent Scientific and, Supp. vi, July 30 ; Supp. viii, August 27 ; Supp. viii, September 24 ; Supp. viii, October 29 ; Supp. viii, November 26 ; Supp. vi, December 31
Technical Education : Industry and (Report of the Conference organized by the Regional Advisory Council for the Organization of Further Education in the East Midlands and the North Midland Regional Council of the Federation of British Industries), 821
Technical Education in Great Britain, 1247
Technical Hardness Measurement : International Conference in Bremen, 194
Technical Libraries : Commercial and (J. P. Lamb), *review* by R. Brightman, 1090
Technical Library Services in Great Britain : Problems of, *review* by R. Brightman, 1090
Technetium-98 in Nature : Occurrence of (Edward A. Alperovitch and J. M. Miller), 299
Technique : Photographic Science and (Scientific and Technical Group of the Royal Photographic Society Conference on), 957
Technique for the Operation of Epididymo-Vasostomy (Film by H. G. Hanley), 341
Technique for the Study of Chromosomes of Palms : A New (A. K. Sharma and S. K. Sarkar), 261
Technique for Studying the *in vitro* Effect of Serum on Activated Taeniid Hexacanth Embryos (Paul H. Silverman), 598
Techniques : Laboratory Apparatus and, with particular reference to Instrumentation (Manchester and District Section of the Royal Institute of Chemistry Exhibition of), 1104
Technological Education (Higher), in Britain, 1085
Technological Education (Higher), in South-East England, 146
Technological Problems involved in using Ionizing Radiations for the Preservation of Food : Scientific and (Dr. R. S. Hannan), 731
Technological Sessions at Geneva : Peaceful Uses of Atomic Energy—Chemical, Metallurgical and General (Dr. R. Spence), 574
Technological Training and Research in Switzerland : A Hundred Years of (Prof. Max Wildi), 758
Technology : A History of (edited by Charles Singer, E. J. Holmyard and A. R. Hall), Vol. 1, From Early Times to Fall of Ancient Empires, *review* by Dr. Friedrich Klemm, 182
  Scholarships to British graduates in Science and (Massachusetts Institute of Technology), 381
Technology of Titanium, *review* by P. L. Teed, 804
Technology in Technical Colleges, National Council of Diplomas in : Establishment of a, 146
  Appointment of Lord Hives as chairman, 146
Technology (Chemical), at the University of Edinburgh, 433
Technology and Industry : Peaceful Uses of Atomic Energy—Radioisotopes in Chemistry, (Dr. Henry Seligman), 854
Teed, P. L. : Technology of Titanium, *review*, 804
Telecommunication Engineers, Institution of (New Delhi) : First Annual General Meeting, 100
  *Journal* of the, No. 1, 432
Television Authority, Independent : Croydon Transmitting Station, 584
Television Transmitter at Meldrum, Aberdeenshire, 723
Television and Electronics : Radio, (Radio Industry Council premiums for articles on), 1153
Television and Film Unit at the London Zoo, 863
Tellurite Glasses : Colour of (Dr. P. L. Baynton), 691
Teitscher, H., and others : Effect of Antibiotics on Indole Synthesis by *Escherichia coli* 7–4, 164
Tempany, Sir Harold : *Obituary* by Sir Frank Engledow, 283
Temperature in the Calf : Comparison of Rectal and Deep Body (Dr. John Bligh), 402
Temperature (Room) : Photochemical Processes in Solids at (Roger A. Ford), 1023
Temperature Measurement and Control (J. A. Chaldecott), 538
Temperature-measuring Instruments : Calibration of (National Physical Laboratory, Notes on Applied Science No. 12), 822
Temperature-Ranges and Distributions of some Vascular Plants (E. P. Jeffree), 703
Temperature and Initial Moisture Content : Effect of, on the Heat of Wetting of Wood (Kathleen E. Kelsey and L. N. Clarke), 83
Temperatures (Mesomorphic and Polymorphic Transition) : A Projection Instrument to aid in the Determination of (Dr. G. W. Gray and A. Ibbotson), 1160
Temple, Prof. G. : Linearized Aerodynamics, *review*, 369
  High-Speed Aerodynamics, *review*, 479
Temple of Nature, or the Origin of Society (Erasmus Darwin), (In Russian), *review* by Dr. S. I. Tomkeieff, 711
Temporary Destocking of Pastures to aid Control of the Cattle Tick (Dr. P. R. Wilkinson), 515
Tennent, Dr. R. M. : Appointed lecturer in physics at the University of Leeds, 862
Tensor Club of Great Britain, 1198
*Terapeutica, Progresso*, a New Italian Medical Review, 148
Terminal Groups of Tobacco Mosaic Virus (Prof. G. Schramm, G. Braunitzer and J. W. Schneider), 456
Termination Reaction in Vinyl Polymerization—Preparation of Block Copolymers (Dr. C. H. Bamford and A. D. Jenkins), 78
Terre : L'Origine de la, systèmes stellaires et planétaires (Alexandre Dauvillier), 1199
Tertiary Age in West Spitsbergen : Pollen-grains and Spores in Coal Deposits of (Svein Manum), 248

Tertiary Alkyl Phosphates, Thiolophosphates and Thionophosphates : A *General Method for Locating the Spots on a Paper Chromatogram* of (Dr. Irmgard K. H. Otter), 1078
Testing Concrete by an Ultrasonic Pulse Technique (Dr. R. Jones and E. N. Gatfield), 538
Testing of Insects as Vectors of Plant Viruses : A Combined Aspirator and Feeding Cage for the Collection and (J. T. Legg), 609
Tetrachloride (Carbon) : Effects of, on Mitosis (B. R. Seshachar and Miss Parvathi K. Nambiar), 796
2,4,5,4′-Tetrachlorodiphenylsulphone : A New Acaricide (Dr. H. O. Huisman, Dr. R. van der Veen and J. Meltzer), 515
Tetrazolium Salts : Mechanism of the Reduction of (B. Jambor), 603
Tetrazolium Salts as Viability Indicators—Radiation-catalysed Reactions (Johnson Parker), 647
Textile Chemistry at Manchester, 430
Textile Institute : *Conference on Raw Cotton, its Properties and Distribution*, 677
  Honorary life membership conferred on Fred Scholefield, 908
  Emsley Lecture (J. R. Whinfield), 908
  Granted a Supplemental Royal Charter, 1101
Textile Progress : Review of, Vol. 4 (1952), Vol. 5 (1953), *review*, 524
Textile and other Industrial Fibres : The Electron Microscopy of (Electron Microscopy Group of the Institute of Physics Conference on), 632
Textile and the Inventive Spirit (J. R. Whinfield), 908
Thacker, Prof. M. S. : Appointed director of the Council of Scientific and Industrial Research, India, 535 ; work of, 535
Thackeray, D. P. C. : Cinematography in Scientific Research, 726
Thames (North) Gas Board : New Laboratories at the Fulham Works opened by Sir Robert Robinson, 1154
Theorell, Prof. Hugo : *Physical Chemistry of Enzymes*, 959
  Awarded the Nobel Prize for 1955 for Physiology and Medicine, 1053
Theorell, Prof. Hugo (Ehrenberg, Anders, and) : Stereochemical Structure of Cytochrome *c*, 158
Theoretical Organic Chemistry, *review* by Dr. P. B. D. de la Mare, 991
Theoretical Physics (Division of Pure Physics of the National Research Council of Canada Colloquium on), 588
Theoretical Principles of Organic Chemistry (Prof. Walter Hückel), Vol. 1 (translated from the corrected seventh German edition by Prof. F. H. Rathmann), *review* by Dr. P. B. D. de la Mare, 991
Theoretical Structural Metallurgy (Prof. A. H. Cottrell), second edition, *review* by Dr. J. A. Catterall, 229
Theories of Colour Vision : Colorimetry and (Dr. D. B. Judd), 100
Theory : Electromagnetic (Prof. V. C. A. Ferraro), *review* by E. Wild, 1237
  Lens, *review* by G. R. Noakes, 1137
Theory of Adhesion (W. G. Cass), 495
Theory of Antibiotic Inhibition Zones in Agar Media (Prof. K. E. Cooper), 510
Theory of Jet Flow, *review by Prof. A. D. Young*, 803
Theory of Lenses (E. W. H. Selwyn), *review* by G. R. Noakes, 1137
Theory of Molecular Vibrational Spectra, *review* by Dr. J. W. Linnett, 1185
Theory of Seismology : An Introduction to the (Prof. K. E. Bullen), second edition, *review* by Dr. R. Stoneley, 992
Theory of the Solid State, *review* by Prof. H. Fröhlich, 479
Theory (General), of High Speed Aerodynamics (edited by W. R. Sears), *review* by Prof. G. Temple, 479
Theory (Quantum), of Solids (Prof. R. E. Peierls), *review* by Prof. H. Frohlich, 479
Theory (Relativity) : Jubilee of the—Conference at Berne (Prof. W. H. McCrea), 330
Theory (Statistical Information), of Visual Thresholds (R. L. Gregory and Violet Cane), 1272
*Theory and Experiment in Physical Chemistry : The Relation between* (Prof. E. A. Guggenheim), 586
Theory and Practice : Combustion in (T. F. Hurley), 1239
Theory and Practice of Neutron Diffraction, *review* by Dr. H. P. Rooksby, 895
Therapy (X-Ray) : Supervoltage Machines for (Exhibition at the Science Museum, London), 379 ; *erratum*, 586
Therien, Dr. B. : Awarded a Graduate Medical Research Fellowship by the National Research Council of Canada, 102
Thermal Expansion of Coal (J. C. Macrae and C. Ryder), 265 ; (A. S. Joy), 924
Thermal Instruments : Heat and (Catalogues of the Exhibits at the Science Museum, London), 538
Thermal Method (A New), for Sound Absorption in Liquids (Dr. S. Parthasarathy, M. Pancholy and C. B. Tipnis), 611
*Thermal Reaction between Hydrogen and Nitrogen Dioxide* (Dr. P. G. Ashmore and B. P. Levitt), 1013
Thermal Stimuli in Lower Vertebrates : Nerve Endings as Transducers of (Dr. R. W. Murray), 698
Thermonuclear Explosions, 1151
Thesaurus : Silicate, *review* by Dr. R. C. Mackenzie, 47
Thewlis, Dr. J. : Non-Destructive Testing, 386
Thewlis, Dr. J. (Berman, Dr. R., and) : The Graphite–Diamond Equilibrium, 834
Thiamin (Vitamin $B_1$) : A New Method for the Microbiological Assay of (J. R. Villanueva), 465
Thiamine Phosphorylation *in vitro* : Action of Insulin on (N. Siliprandi, V. Boffi and A. Locarelli), 219
Thick Oxide Layers on Aluminium : Electron Micrographs from (C. J. L. Booker, J. L. Wood and A. Walsh), 222
Thiobacilli : Anaerobic Metabolism of Thiocyanate by (J. P. van der Walt and C. D. de Kruyff), 310
*Thioctic Acid : Effect of, on Glucose Oxidation by Liver Slices* (J. Bornstein and Beryl D. Hartman), 788
6,8-Thioctic Acid : Strain in (Dr. S. Sunner), 217
Thiocyanate : Anaerobic Metabolism of, by Thiobacilli (J. P. van der Walt and C. D. de Kruyff), 310
Thiolophosphates and Thionophosphates : A General Method for Locating the Spots on a Paper Chromatogram of Tertiary Alkyl Phosphates, (Dr. Irmgard K. H. Otter), 1078
Thionine : Slow Disappearance of Fluorescence in, on addition of Abietic Acid (Prof. Santi R. Palit and Byomkesh Biswas), 214
Thionophosphates : A General Method for Locating the Spots on a Paper Chromatogram of Tertiary Alkyl Phosphates, Thiolophosphates and (Dr. Irmgard K. H. Otter), 1078
Thirumalachar, Dr. M. J. : *Chainia, a New Genus of the Actinomycetales*, 934
Thixotropy (Negative), of Aqueous Solutions of Polymethacrylic Acid (J. Eliassaf, A. Silberberg and Prof. A. Katchalsky), 1119
Thom, G. V. : Use and Abuse of Protective Equipment, 1252
Thomas, Dr. A. S. : Myxomatosis, 1156
Thomas, Dr. H. Dighton : *Obituary* of Dr. Stanley Smith, 377
Thomas, H. E. : Use and Abuse of Protective Equipment, 1252
Thomas, Dr. H. Hamshaw : *Instability of the Earth's Axis*, 349
  Obituary of Sir Arthur Tansley, 1245
Thomas, Dr. O. F. : Choice of Drugs in the Treatment of Tuberculosis, 245
Thomas, Dr. Owen Lewis : Canals within *Pancreas Cells*, 978
Thomas, Dr. P. J. (Maccoll, Dr. Allan, and) : A Correlation between the Rates of Unimolecular Pyrolysis of Alkyl Halides in the Gaseous Phase and $S_N1$ Rates in Solution, 392
Thomas, S. B. : Elected president of the Society for Applied Bacteriology, 149
Thomas, W. R., and Leak, Dr. G. M. : Condition of Boron in Alpha Iron, 29
Thompson, A. B., and Woods, D. W. : Density of Amorphous Polyethylene Terephthalate, 78
Thompson, Dr. Alberto F. : Appointed head of the Office of Scientific Information of the National Science Foundation, 1054 ; work of, 1054
Thompson, Prof. E. H. : New Air-Photo Automatic Plotting Machine, 1057
Thompson, Dr. E. O. P. : Chemistry of Wool, 713
Thompson, H. : The Function of Libraries, 1253
Thompson, Harry V. (Backhouse, Dr. Kenneth M., and) : Myxomatosis, 1155
Thompson, Harry V., and others : Myxoma Virus in Britain, 783
Thompson, Dr. H. W. : Advances in Molecular Spectroscopy—Meeting in Oxford, 680
Thompson, J. L. : Awarded a Premium by the British Institution of Radio Engineers, 536
Thompson, Dr. S. Y., and others : Marine Biological Research, 108
Thompson, Dr. W. B. : Magneto-Hydrodynamics, 236
Thomson, A. F. H. : Design of Electronic Devices for Production, 1060
Thomson, B. : *Embrittlement of Tungsten Wire*, 360
Thomson, J. : Design of Electronic Devices for Production, 1059
Thomson, Dr. L. C. : *Obituary* by Dr. H. J. A. Dartnall, 906
Thomson, Dr. Muirhead : Myxomatosis, 1155
Thoresby Society : Fifth Report, 240
Thorne, G. N. : Interactions of Nitrogen, Phosphorus and Potassium on Sugar-Beet, 344
Thorne, R. P. (Gillieson, A. H., and) : Discrepancy between the Spectroisotopic and the Mass-Spectrometric Results for the Natural Abundance Ratio of the Lithium Isotopes, 1228
Thornton, B. S. (Harle, G. A., and) : An Interference Optical Alinement Method, 651
Thornton, D. D. : Appointed pasture agronomist, Uganda, 910
Thornton, John L., and Tully, R. I. J. : Scientific Books, Libraries and Collectors, *review by Prof. E. N. da C. Andrade*, 663
Thorp, J. S. (Bright, Dr. A. W., and) : Measurements of Retarding Potential on the Hollow Cathode, 1079
Thorsen, J. : Appointed veterinary officer, Northern *Region*, Nigeria, 539
Threat to Science, 1134
Thresh, Miss R. : Plant Growth Substances, 531
Thring, Prof. M. W., and Hulse, Dr. C. : Flames and Combustion, 771
Thromboplastin Generation Test : Sources of Platelet Factor for the (M. J. Newlands and Dr. F. Wild), 885
Thunderstorm Electricity (edited by Horace R. Byers), *review* by Dr. J. Alan Chalmers, 573
Thung, Dr. P. J. : Endocrinology and Ageing, 292
Thyroxine : Probable Nature of an Artefact in the Paper Chromatography of, caused by Trichloracetic Acid (J. D. Acland), 694
Tick (*Cattle*) : *Temporary Destocking of Pastures* to aid Control of the (Dr. P. R. Wilkinson), 515
Tiercy, G. : The Shape of the Earth, 1004
Tiglic and Angelic Acids : Configurations of—an *X-Ray Determination* (A. L. Porte and Prof. J. Monteath Robertson), 1116
Tiku, P. N. (Sharma, Surendra, and) : Venous System of *Rana tigrina* Daud., 335
Till, M., and others : Progress in Radiobiology, 683
Tillering in Young Grass Plants : Cessation of (Arthur Troughton), 514
Tillman, Dr. J. R. : Semiconductors and Transistors—some Current Problems, 9
Tillotson, Ernest : Earthquake Geography, *review*, 617
  British Seismology during 1954–55, 679
Time : An Atomic Standard of Frequency and Time Interval—Definition *of the Second of* (Sir Edward Bullard), 282, *erratum*, 381
  Definition of the Second of (Sir H. Spencer Jones), 669 ; (Dr. G. M. Clemence), 1230
*Time Interval : An Atomic Standard of Frequency and*—A Caesium Resonator (Dr. L. Essen and J. V. L. Parry), 280 ; Definition of the Second of Time (Sir Edward Bullard), 282, *erratum*, 381
Time Interval between Nucleogenesis and the Formation of *Meteorites* (G. J. Wasserburg and R. J. Hayden), 130
Timing (Sir Frederic Bartlett), 449
Timmons, C. J. : Advances in Molecular Spectroscopy, 683
Timothy Grass (*Phleum pratense*) : Ear Formation in, following Vernalization and Short-day Treatments (Dr. R. H. M. Langer), 263
Tinkham, M. (Pitt, G. A. J., and) : Lumi- and Meta-Rhodopsin, 220
Tipnis, C. B., and others : A New Thermal Method for Sound Absorption in Liquids, 611
*Tipula paludosa* (Diptera) : Intranuclear Changes in the Polyhedrosis of (Dr. Kenneth M. Smith), 255
*Tissières, Dr. A., and Slater, Prof. E. C.* : Respiratory Chain Phosphorylation in Extracts of *Azotobacter vinelandii*, 736
Tissue (Connective) : Influence of Cortisone on—Epithelial Relations in Wound Healing, Hair *Regeneration and the Pathogenesis of Experimental* Skin Graft (Prof. Theodore Gillman, Jack Penn, Doris Bronks and Marie Roux), 932
Tissue (Homologous Normal) : Combined Amino-Acid Content of Tumour and (Dr. G. C. Easty and Dr. E. J. Ambrose), 1256
Tissue (Ovarian) : Radiation Sensitivity of, at −79° C. (Dr. A. S. Parkes), 1216

Tissue Culture : Interference between Variants of Pseudorabies Virus demonstrable in (Dr. George Ivanóvics, Helena Béládi and Ervin Szollósy), 972
Tissue Cultures (Kidney Monolayer) Growth and Titration of the Viruses of Foot-and-Mouth Disease and Vesicular Stomatitis in (R. F. Sellers), 547
Tissue Homogenates : Selective Digestion of the Neurosecretory Material of the Hypothalamus and of the Neurohypophysis by (A. Bereson, W. A. Hadler and J. H. Tramezzani), 600
Tissue Sections · Blocking of Lead Tetraacetate—Schiff Reactions in, by Boric Acid (Dr. P. H. Staple), 1125
Tissues : Extraction of Collagen from (Shirley M. Fitch, Mrs. Margaret L. R. Harkness and Dr. R. D. Harkness), 163
Tissues of Normal, Insulin-treated and Adrenalectomized Rats : Adrenaline and Noradrenaline in (Dr. Katharine Montagu), 555
Tissues of Ruminants · Identification of Pseudocholinesterase in the (Prof. B. Mendel and Dr. D. K. Myers), 783
Tissues (Animal) : Metabolism of Propionic Acid in (Dr. Martin Flavin, Priscilla J. Ortiz and Prof. Severo Ochoa), 823
Titanium : Technology of, *review* by P. L. Teed, 804
Titanium in Industry (Stanley Abkowitz, John J. Burke and Ralph H. Hiltz, Jr.), *review* by P. L. Teed, 804
Titchmarsh, Prof. E. C. : Awarded the Sylvester Medal for 1955 of the Royal Society, 907, 1094 ; work of, 1094
Titration : Growth and, of the Viruses of Foot-and-Mouth Disease and Vesicular Stomatitis in Kidney Monolayer Tissue Cultures (R. F. Sellers), 547
Tobacco Mosaic Virus : Distribution of Radiocarbon in (Miss G. Wostlinger, H. Schonfellinger and Prof. E. Broda), 306
  Terminal Groups of (Prof. G. Schramm, G. Braunitzer and J. W. Schneider), 456
Todd, Sir Alexander · Nucleic Acid Structure and Function (Presidential Address to Section B (Chemistry) of the British Association for the Advancement of Science), 440
  Awarded a Royal Medal for 1955 of the Royal Society, 953, 1093 ; work of, 1093
Todd, Sir Alexander, and Hodgkin, Dr. Dorothy Crowfoot, and co-workers : Advances in Organic Chemistry, 761
Todd, Sir Alexander, and others Structure of Vitamin $B_{12}$—The Structure of Vitamin $B_{12}$, and its Hexacarboxylic Acid Degradation Product, 328
Todd, Audrey Appointed to a fellowship in chemistry in the University of Birmingham, 1055
Todd, L. S. : Appointed agricultural officer, Uganda, 16
Toennies, Dr. G., and Bakay, B. : Characterization and Total Recovery of the Component Proteins of a Deoxyribonucleoprotein, 696
Tolba, Dr. M. K., and Moubasher, A. H. : Influence of the Origin of the Isolate of *Rhizoctonia solani* on its Pathogenicity, 211
Tomaschek, Prof. R. : Earth Tilts in the British Isles connected with Far Distant Earthquakes, 24
Tombs, D. M. : Corona Wind Loud-Speaker, 923
Tomkeieff, Dr. S. I. : Coals and Bitumens and related Fossil Carbonaceous Substances, *review* by Dr. J. Bronowski, 184
  Erasmus Darwin, *review*, 711
  D. I. Mendeleeff and the Periodic System, 965
Tomlin, Dr. D. H. (Hyman, R. A., and) : Fixation of Iodine in Selenium, 977
Tomlinson, Dr. M. L. (Smith, Dr. J. C., and) : Obituary of Dr. S. G. P. Plant, 628
Tomlinson, Dr. T. B. : Awarded the Heinrich Hertz Premium for 1954 of the British Institution of Radio Engineers, 536
Toms, A. H. Soil Mechanics, Geology and Civil Engineering, 716
Tonolo, Dr. A., and others Ferroverdin, a Green Pigment containing Iron produced by a Streptomycete, 645
Topchiev, A. V. (edited by) · D. I. Mendeleeff—Scientific Archives, Vol. I, Periodic Law, The Natural System of Elements, Manuscripts and Tables, 1869–1871 (Russian text), 965
Topography (Lunar) : Changes in (Dr. H. P. Wilkins), 447
Torsion of Zinc Crystals : Flexural Rotational Slip as the Main Deformation Process in the (A. D. Whapham and Dr. H. Wilman), 460
Torsion Balance : The Origins of the, *review* by Sir Edward Bullard, 228
Total Recovery of the Component Proteins of a Deoxyribonucleoprotein · Characterization and (Dr. G. Toennies and B. Bakay), 696
Tower of Babel—the Language Barrier in Science (B. C. Vickery), 939
Towns and their Hinterlands (Prof. L. Dudley Stamp), 150
Townsend, W. N., and others · Plant Growth on 'Fly Ash', 983
Toxic Chemicals in Agriculture—Risks to Wild Life, 380
Toxin (Diphtheria) · Production of, in Submerged Culture (F. V. Linggood, A. C. Matthews, S. Pinfield, Dr. C. G. Pope and T. R. Sharland), 1128
Toy, Dr. F. C. : Resignation as director of research to the British Cotton Industry Research Association, 1150 ; work of, 1150
Trace Elements and Plant Growth (British Association for the Advancement of Science, Sections K (Botany) and M (Agriculture), Discussion on), 621
Tracer Technique (Isotopic) : Chemistry, Biochemistry and (Dr. G. Popják), 193
Trade (Sea Transport and) : The Influence of the Engineer on (Dr. S. F. Dorey), 442
Training · Liberal Values in Further Education and, 343
Training of Graduate Staff for Industrial Research : The Education and (Fourth Conference of Industrial Research Directors and Managers), 141
Training and Research (Technological) : A Hundred Years of, in Switzerland (Prof. Max Wildi), 758
Training College Students : Report of the Working Party on Grants to (Ministry of Education), 295
Tramezzani, J. H., and others · Selective Digestion of the Neurosecretory Material of the Hypothalamus and of the Neurohypophysis by Tissue Homogenates, 600
Transaminase and Decarboxylase Catalysed by Extracts of the Silkworm, *Bombyx mori* L. : Studies on (B. Bheemeswar), 555
Transcendental Functions : Higher (based, in part, on Notes left by the late Prof. Harry Bateman, and compiled by the staff of the Bateman Manuscript Project), Vol. 3 (edited by A. Erdélyi), *review* by Prof. T. M. MacRobert, 1138
Transducers of Thermal Stimuli in Lower Vertebrates Nerve Endings as (Dr. R. W. Murray), 698
Transfer of Mammalian Ova between Species (R. L. W. Averill, C. E. Adams and L. E. A. Rowson), 167
Transfer of Proteins from the Yolk to the Chick Embryo (A. M. Schechtman and Patricia F. Knight), 786
Transformation of the *Lewis* Groups of Human Red Cells (Mrs. Joan S. Sneath and P. H. A. Sneath), 172
Transformation of Pentose Phosphates by Enzymes of Animal Origin (Prof. Frank Dickens and D. H. Williamson), 400
Transformation (Apparent), of Collagen Fibrils into 'Elastin' (Prof. D. Burton, Dr. D. A. Hall, Dr. M. K. Keech, Dr. R. Reed, Miss H. Saxl, Prof. R. E. Tunbridge and Miss M. J. Wood), 966
Transistors : Semiconductors and—some Current Problems (Dr. J. R. Tillman), 9
Transition Temperatures (Mesomorphic and Polymorphic) : A Projection Instrument to aid in the Determination of (Dr. G. W. Gray and A. Ibbotson), 1160
Translations of Foreign Scientific Material · Index of (Leslie Wilson), 1276
Translocated Antibiotics in Expressed Plant Sap : Evidence of (S. H. Crowdy and D. Pramer), 335
Transmission of Disease : Biological Aspects of the (Institute of Biology Symposium on), 493
Transplants (Long-term), of Infantile Rat Pituitaries cultivated *in vitro* and Grafted into the Anterior Eye Chamber of Young Cats (Dr. P. M. Martinovitch and D. V. Radivojevitch), 699
Transport (Marine) The Engineer and (Dr. S. F. Dorey), 442
Transport Policy in Great Britain, 179
Transport and Trade (Sea) : The Influence of the Engineer on (Dr. S. F. Dorey), 442
Transvaal Museum, Pretoria : *Bulletin*, No. 1, 148
Trapeznikov, V. A. Automation in the Soviet Union, 294
Trapping Airborne Micro-organisms : A Water-soluble Filter for (Merfyn Richards), 559
Trautwein, Dr. W. (Hutter, Dr. O. F., and) : Effect of Vagal Stimulation on the Sinus Venosus of the Frog's Heart, 512
Travel in the United States : Fellowships for Study and (Commonwealth Fund), 725
Treacy, Dr. P. B. · Magnetic Moment of an Excited State of the Fluorine-19 Nucleus, 923
Treanor, Dr. P. J. : Interference Photography of the Chromospheric Spectrum, 1166
Treasury, H.M. : Grants to the Department of Applied Mathematics, Queen's University of Belfast, of £2,250 for a rocket research project, and £1,200 in connexion with the International Geophysical Year, 1104
Treated Bronzes : Washing of (R. M. Organ), 817
Tree Crowns . Removal of Mineral Nutrients from, by Rain (G. M. Will), 1180
Tree Root Development on Upland Heaths (C. W. Yeatman), 675
Treloar, Dr. L. R. G. Visco-elastic Behaviour, 61
Trewavas, Dr. Ethelwynn, and others : Herpetichthyes, Amphibioidei, Choanichthyes or Sarcopterygii ?, 126
Triaryl Phosphates in Rodents : Metabolism of (Dr. D. K. Myers, J. B. J. Rebel, C. Veeger, A. Kemp and E. G. L. Simons), 259
Triassic of Israel Occurrence of Vertebrates in the (Dr. F. Brotzen), 404
1 : 2 · 4-Triazoles : Inhibition of Cholinesterases by (Dr. J. B. Polya), 1175
Tribe, Dr. D. E. : Appointed reader in the physiology of domestic animals at the University of Melbourne, 910
Trichloracetic Acid Probable Nature of an Artefact in the Paper Chromatography of Thyroxine caused by (J. D. Acland), 694
*Trichomonas hominis* cultured without Bacteria (Dr. I. de Carneri), 605
Tri-glycerides (Mono-, Di and) : A Simplified Method of preparing Pure (L. Hartman), 1024
Trier, P. E. : Design of Electronic Devices for Production, 1060
Trimethyl Ammonium Halides (*n*-Alkyl) : Separation within the Homologous Series of *n*-Alkyl Sulphates, *n*-Alkyl Pyridium and, by Paper Chromatography (H. Holness and W. R. Stone), 604
Tring Reservoirs Nature Reserve, 239
Triplet States of Organic Molecules : Photomagnetism of (Dr. D. F. Evans), 777
Triplex Safety Glass Co., Ltd. : Appointment of K. J. B. Wolfe as head of fundamental research, 1200
Trisaccharide ('Branched') : Enzymic Synthesis of a (Dr. R. W. Bailey, Dr. S. A. Barker, Dr. E. J. Bourne and Prof. M. Stacey), 1164
Tritiated Water at High Humidities in the Geiger Region : Counting (Edward B. Butler), 1262
Tritium in Water Samples : Measurement of (J. F. Cameron), 1264
Tropical Areas : Education and Social Change in (Prof. Margaret Read), *review* by R. Brightman, 757
Tropical Meteorology (Herbert Riehl), *review* by Prof. P. A. Sheppard, 989
'Tropical Storm' Photographed from a Rocket (L. F. Hubert and O. Berg), 1198
Tropical Swamps . Research on the Biology of (Grant of £21,900 from the Nuffield Foundation to Makerere College, Uganda, for), 536
Tropics : Weather of the, *review* by Prof. P. A. Sheppard, 989
Troughton, Arthur Cessation of Tillering in Young Grass Plants, 514
Trout (Sea) : 'Homing Instinct' in (W. M. Shearer), 171
True Zeta-Potential of Arsenious Sulphide Sol in the Region of Slow Coagulation · Electrophoretic Measurement of the (Prof. B. N. Ghosh and K. C. Ray), 1080
Trueblood, Prof. Kenneth N., and others · Structure of Vitamin $B_{12}$—The Crystal Structure of the Hexacarboxylic Acid derived from $B_{12}$ and the Molecular Structure of the Vitamin, 325
Trumpler, Dr. R. J. : At the Conference in celebration of the Jubilee of the Relativity Theory, 330
Trumpy, Dr. Georg Circular Polarization of Gamma-Rays following Polarized Neutron Capture, 507
Trypsin : Crystalline Inhibitors of, from Potato (Prof. Kamala Sohonie and K. S. Ambe), 972
  Site of Inhibition of, by Diethyl *p*-Nitrophenylphosphonate (T. Viswanatha and I. E. Liener), 1120
Trypsin (Acyl) : Inhibition of, by Human Serum (Dr. M. Bier, J. Sri Ram and Prof. F. F. Nord), 789

Tryptic Shock : Release of Histamine in Hepatectomized Dogs during Anaphylactic, Peptone and (H. Moussatché), 648

Tsao, Meak-Seng : Appointed assistant professor of chemistry in the University of Pittsburgh, 862

Tsetse Flies : Biology of, *review* by Dr. T. A. M. Nash, 755
    The Natural History of (Prof. Patrick A. Buxton), *review* by Dr. T. A. M. Nash, 755
    West African, 537

Tsuchida, Ryutaro, and Yamada, Shoichiro . Direct Interaction between Copper Ions in the Molecules of Copper Acetate and Propionate, 1171

Tswett, Michael : First Paper on Chromatography (Gerhard Hesse and Herbert Weil), *review* by Dr. R. Consden, 526, 632

Tube Investments Ltd., and others : Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860

Tuberculosis, National Association for the Prevention of : Fourth Commonwealth Health and Tuberculosis Conference, 245

Tuberculosis Conference : Fourth Commonwealth Health and (National Association for the Prevention of Tuberculosis), 245

Tubes : Formation of, by a Simple Rolling Action—A New Normal-Pressure Effect (M. J. Egan and A. Jobling), 689

Tucker, Dr. D. G. : Appointed professor of electrical engineering at the University of Birmingham, 862, 907 ; work of, 907

Tucker, Denys W. : An Uncollected Record of the Great Sea-serpent, 705
    English Style in Scientific Papers, 1251

Tucker, Denys W., and others : Herpetichthyes, Amphibioidei, Choanichthyes or Sarcopterygii ?', 126

Tukey, H. B. (edited by) : Plant Regulators in Agriculture, *review* by Prof. L. J. Audus, 137

Tulecke, Dr. Walter R. : *Appointed research associate at the Brooklyn* Botanic Garden, 862

Tully, R. I. J. (Thornton, John L., and) : Scientific Books, Libraries and Collectors, *review* by Prof. E. N. da C. Andrade, 663

Tumorous Growth in Coconut Milk : Growth Factors and (Prof. F. C. Steward, S. M. Caplin and E. M. Shantz), 537

Tumour (Sarcoma 37 Mouse-Ascites) . Growth of, in Peritoneal Fat (Dr. Peter Warner), 1030

Tumour Cells (Ehrlich Ascites) : Separation of, from other Cellular Elements (Prof. Per Eric Lindahl and George Klein), 401

Tumour and Homologous Normal Tissue : Combined Amino-Acid Content of (Dr. G. C. Easty and Dr. E. J. Ambrose), 1256

Tumour-bearing Rats : Immunological Discrimination between the Blood of Normal and of (Dr. D. A. Darcy), 643

Tumours *in vivo* : Action of Ribonuclease on Two Solid (L. Ledoux), 36

Tun Yin, U. : Wild Life Preservation in Burma, 585

Tunbridge, Prof. R. E., and others : Apparent Transformation of Collagen Fibrils into 'Elastin', 966

Tung (*Aleurites montana*) : Rainfall and Biennial Bearing in (D. H. Laycock and L. J. Foster), 654

Tungsten and Copper Cathodes . High-Pressure Glow-to-Arc Transitions with (W. L. Price, W. A. Gambling and Dr. H. Edels), 28

Tungsten Wire : Embrittlement of (B. Thomson), 360

Tuomikoski, P. : Advances in Molecular Spectroscopy, 682

Turbidimetric Measurement on Synchronized *Salmonella typhimurium* Cultures (Dr. V. G. Bruce, K. G. Lark and O. Maaloe), 563

Turbine (Gas) . The Development of the (Sir Harold Roxbee Cox), 1104

Turkevich, Dr. Anthony (Reed, Dr. George W., and) : Uranium Content of Two Iron Meteorites, 794

Turkish National Institute of Bibliography : Bibliography of Articles appearing in Turkish Periodicals, 195

Turkish Periodicals : Bibliography of Articles appearing in (Turkish National Institute of Bibliography), 195

Turner, E. R. : Nodulation of Clover Plants, 193

Turner, Geoffrey : Hair Embroidery in Siberia and North America, 724

Turner, Sir James : Land Use in Britain, 339

Turner, J. S. (Kelso, J. M., and) : Auxin and Streaming, 732

Turner, P. D. : Appointed mycologist, West African Cocoa Research Institute, Gold Coast, 1249

'Turnover' in Biochemistry : Meaning of (Dr. C. A. Mawson), 317

Tutin, Prof. T. G. : Criteria of Genera, 676

*Twentieth Century*, September issue, 753

Twinning in Plants : Experimentally Induced (Dr. Barbara Haccius), 355

Twiss, Dr. R. Q. : Design of Electronic Devices for Production, 1060

Twyford, I. T. . Appointed chemist, Department of Agriculture, Fiji, 910

Type (A New), of Plant Growth-regulating Substances (Dr. G. J. M. van der Kerk, Dr. M. H. van Raalte, Dr. A. Kaars Sijpesteijn and Dr. R. van der Veen), 308

Typhoid Vi and *O* Antigens . Production of '*O* Inagglutinability' in Erythrocytes coated with (Dr. Maurice Landy and Ruggero Ceppellini), 1266

UGANDA : Œstrus in Zebu Cattle in (D. H. L. Rollinson), 352

Uhlmann, G., and others : Progress in Radiobiology, 684

Ullmann, Prof. Stephen . Semantics, 673

Ultra-High Vacua : Production and Measurement of (Dr. J. A. Becker), 452

Ultra High-speed Skew-ray Tracing (Dr. Gordon Black), 27

Ultrasonic Diffraction Methods : Determination of Elastic Constants of Solids by (Dr. G. S. Verma), 27

Ultrasonic Pulse Technique . Testing Concrete by an (Dr. R. Jones and E. N. Gatfield), 538

Ultrasonics : Applications of (Centre National de Recherches Scientifiques Conference on), 387

Ultra-Violet : Brightening of the Solar Limb in the Far (C. M. Minnis), 652

Ultra-Violet Absorption of Lignins : Contribution of Residues containing Carbonyl to the (Dr. D. C. C. Smith), 927

Ultra-Violet Spectrophotometry of Barbiturates : Interference to the (Dr. A. S. Curry), 877

Unclassified Reports on Atomic Energy (United Kingdom Atomic Energy Authority), 1003

Uncollected Record of the Great Sea-serpent (Denys W. Tucker), 705

Underwood, Dr. E. Ashworth : Guy's Hospital, *review*, 893
    Victory over the Plague, *review*, 615, 957
    Malaria in Retrospect, *review*, 1040

Underwood, J. : Cinematography in Scientific Research, 726

Unesco : Plant Ecology—Review of Research (Arid Zone Research, Vol. 6), 776
    Proceedings of the Conference on the Conservation of Nature in the Near and Middle East, 58
    Conference on the Dissemination of Science, 1008

Unified Screw Thread : Adoption of the, by British Industry (Conference at the British Standards Institution), 62

Uniform Field Breakdown in Hydrogen : Mechanism of (A. Wilkes, W. Hopwood and N. J. Peacock), 837

*Unilateral Hybridization* (B. J. Harrison and L. A. Darby), 982

Unimolecular Pyrolysis of Alkyl Halides in the Gaseous Phase : A Correlation between the Rates of, and $S_N1$ Rates in Solution (Dr. Allan Maccoll and Dr. P. J. Thomas), 392

Uninitiated : Electricity for the, *review* by G. R. Noakes, 1089

Union of South Africa : A Survey of the Food and Feed Resources of the (G. Van de Wall and E. D. Alvord, Jnr.), *review* by Sir John Russell, 90

Unit-Cell Dimensions of γ-Lauric and γ-Myristic Acids (T. R. Lomer), 653

Unit Cells : Age of Uraninites from Dimensions of their (S. A. Hiemstra), 405 ; (Dr. B. Wasserstein), 405

United Kingdom, 1900–1919 : Consumers' Expenditure in the (A. R. Prest, assisted by A. A. Adams), *review*, 4

United Kingdom, 1920–1938 : The Measurement of Consumers' Expenditure and Behaviour in the (Richard Stone), Vol. 1, *review*, 4

United Kingdom Agricultural and Food Representatives in Canada, 378

United Kingdom Assistant Agricultural and Food Attaché in Washington, D.C. . Appointment of O. G. Williams as, 722

United Kingdom Atomic Energy Authority : Reductions in the prices of Iodine-131 and Colloidal Gold-198, 334
    Use of Radioactive Caesium for Cancer Treatment, 379
    Appointment of W. Strath as a full-time member, 770
    Appointment of Sir Rowland Smith and C. F. Kearton as part-time members, 770
    Unclassified Reports on Atomic Energy, 1003
    Gift of £3,675 to the Department of Chemical Engineering, University of Birmingham, for research on the characteristics of 'Spraypak', 1055
    Gift of £3,225 to the Department of Physical Metallurgy, University of Birmingham, for research on the properties of ionic crystals, 1055
    First Annual Report for 1954–1955, 1193

United Kingdom Atomic Energy Authority and the Indian Department of Atomic Energy : Agreement on the promotion and development of the Peaceful Uses of Atomic Energy, 1247

United Kingdom Atomic Energy Authority (Scientific Instrument Manufacturers Association and the) : Radio Isotope Instrumentation and Accessories (Dr. D. Taylor and A. G. Peacock), 1102

United Kingdom Atomic Energy Authority Industrial Group : The Culcheth Laboratories of the (Dr. A. B. McIntosh), 484

United Nations : International Conference on the Peaceful Uses of Atomic Energy, 99

United Nations and the Peaceful Uses of Atomic Energy, 225

United Nations Children's Fund, and others : The Nutritional Work of the (Nutrition Society Symposium on), 16

United Nations Food and Agriculture Organization : Inland Fisheries Training Centre in Java, 909

United Nations Food and Agriculture Organization, *review* by Sir John Russell, 941

United Nations Food and Agriculture Organization, and others : The Nutritional Work of the (Nutrition Society Symposium on), 16

United Nations Food and Agriculture Organization, in co-operation with the Chilean Government : Trials with a Protein-rich Fish Flour, 101

United States : Basic Research in the, 295
    Fellowships for Study and Travel in the (Commonwealth Fund), 725
    Medical Education in the (Commonwealth Fund Grants for), 1102
    Organization of Defence Research in the, 1012
    Scientific Research and Man-power in the, 543
    Trends in Metallurgical Research in the (Dr. E. C. Bain), 725
    Young Managers in the, 775

United States of America : The Pharmacopeia of the, fifteenth revision (U.S.P. 15), *review* by Prof. J. H. Gaddum, 1186

United States Atomic Energy Commission (University of California and the) . Announcement of the detection of the Negative Proton, or Anti-proton, 860

United States Department of the Interior (Fish and Wildlife Service) : Circular 27, The Golden Eagle in America (Lee W. Arnold), 247

United States Geological Survey : Technical Files in Palaeontology, 585

United States National Bureau of Standards : Circular No. 539, Standard X-Ray Diffraction Powder Patterns, 147
    Handbook 54, Protection against Radiations from Radium, Cobalt-60 and Caesium-137, 769
    Tables of Functions and of Zeros of Functions (Applied Mathematics Series, No. 37) ; Table of Salvo Kill Probabilities for Square Targets (Applied Mathematics Series, No. 44) ; Tables of the Error Function and its Derivative (Applied Mathematics Series, No. 41), *review* by J. H. Pearce, 848
    Circular No. 551, Engineering Aspects of the Electronic Computer Programme, 1003

Universities . Education and the, 661

Universities and Academic Freedom, 567

Universities of the British Commonwealth, Association of . Commonwealth Inter-University Conference, 194
    Report of the Proceedings of the 1954 Conference of the Universities of Great Britain and Northern Ireland, 195
    Appendices II and III of the Commonwealth Universities Yearbook (Postgraduate Awards in British Commonwealth Universities), 1199

Universities of the Commonwealth : Yearbook of the, thirty-second issue, *review*, 92
Universities of Great Britain and Northern Ireland : Report of the Proceedings of the 1954 Conference (Association of Universities of the British Commonwealth), 195
Universities (British Commonwealth) Postgraduate Awards in (Association of Universities of the British Commonwealth), 1199
Universities (South African) . Register of Current Scientific Research at, Vol. 3 (Council for Scientific and Industrial Research, Pretoria), 492
Universities Council for Adult Education : Report for 1953–54, 686
Universities Federation for Animal Welfare Summer School, 195
  Pamphlet on Kind Killing (Dr. Jean Vinter), revised edition, 862
Universities Film Council, British : Conference on the Film in Training and Research in Psychology and Psychological Medicine, 1109
University Civic—Aspects of a British Tradition (Prof W. H. G. Armytage), 567 , *review* by J F. Wolfenden, 411
University of Aberdeen Appointment of Dr. H W. Kosterlitz as reader in physiology, 288
  Appointment of Dr T. N. Morgan as reader in materia medica, 288
  Appointment of Dr W. P D. Wightman as reader in history and philosophy of science, 288
  Appointment of Dr. W. T. H. Williamson as reader in soil science, 288
  University Studies, No. 33, The British University System 1914–1954 (P J Anderson Memorial Lecture), (Sir Hector Hetherington), 522, 567
University of Birmingham : Title of reader in analysis in the Department of Mathematics conferred on Dr B Kuttner, 15
  Title of reader in mycology in the Department of Botany conferred on Dr C. J. Hickman, 15
  Appointment of Dr G W. Hutchinson as lecturer in physics, 15
  Appointment of Dr. T. S. West as lecturer in chemistry, 15
  Appointment of R. Humphreys as lecturer in civil engineering, 15
  Appointment of Dr Ingeborg Gurland as lecturer in education—child development, 15
  Appointment of C. J Phillips as lecturer in education—psychology, 15
  Establishment of a postgraduate course in coal preparation, 15
  Grant of £1,500 a year for three years by Quaker Oats, Ltd , to the Department of Pharmacology, for research into the chemistry and nutritional value of cereals, 15
  Appointment of Dr. D G Tucker to the chair of electrical engineering, 862
  Appointment of Prof D. G Catcheside to a chair of microbiology, 862
  Title of reader in chemical engineering conferred on Dr. S. R. M. Ellis, 862
  Title of reader in pathology conferred on Dr. D. B. Brewer, 862
  Appointment of Dr. G. E Brown as lecturer in mathematical physics, 862
  Appointment of Dr. G. Bullock as lecturer in physical metallurgy, 862
  Appointment of Dr. R F King as lecturer in geophysics, 862
  Appointment of J Manheim as lecturer in mechanical engineering, 862
  Appointment of Dr. W T W. Potts as lecturer in zoology, 862
  Appointment of Dr S. J. Taylor as lecturer in mathematics, 862
  Appointment of T. R Carson to a research fellowship in electron physics, 862
  Appointment of B. W. Downs to a research fellowship in mathematical physics, 862
  Appointment of J Graham to a research fellowship in physical metallurgy, 862
  Appointment of Dr. W. H Holden to a National Coal Board fellowship in chemistry, 862
  Appointment of K. B. Mathur to an I.C.I. fellowship in chemical engineering, 862
  Appointment of D. S Rowe to a research fellowship in experimental pathology, 862
  Appointment of Dr W. I. Stephen to an I.C I. fellowship in chemistry, 862
  Title of reader in mathematical physics conferred on Dr. R. H. Dalitz, 1055
  Appointment of Dr. P H. Rose as lecturer in physics, 1055
  Appointment of S W Green as lecturer in botany, 1055
  Appointment of Dr. J. S. M. Botterill as lecturer in chemical engineering, 1055
  Appointment of J. W R Griffiths and J. C Cluley as lecturers in electrical engineering, 1055
  Appointment of Dr. H. Y. Young as lecturer in electron physics, 1055
  Appointment of Dr. C. B. B. Bull to a fellowship in geophysics, 1055
  Appointment of Dr. A. M. Bolsterli and Dr. E Vogt to fellowships in mathematical physics, 1055
  Appointment of D. B Idle to a fellowship in botany, 1055
  Appointment of Dr. R. A. James and S. Markowitz to fellowships in physics, 1055
  Appointment of Dr. Eleanor H. Slifer to a fellowship in zoology, 1055
  Appointment of Audrey Todd to a fellowship in chemistry, 1055
  Gift of £550 from the Electrical Research Association to the Department of Chemistry, for research on the fundamental characteristics of the oxidation of certain liquid hydrocarbons, 1055
  Gift of £700 rising to £850 over three years from S. C Johnson and Co., to the Department of Chemistry, for a research fellowship on waxes, 1055
  Gift of two grants from the Highway Engineering Education Trust to the Department of Civil Engineering, one for establishing a lectureship in highway engineering, and the other for a Summer School in road construction, traffic engineering and highway soil mechanics, 1055
  Gift of £800 from the Central Electricity Authority to the Department of Electrical Engineering, to continue research work on electrostatic precipitation of dust, 1055
  Gift of £935 from the Ministry of Supply to the Department of Chemical Engineering, for research on the low-temperature properties of esters, 1055
  Gift of £600 a year for two years from Whiffen and Sons, Ltd., to the Department of Chemical Engineering, for research in liquid-phase corrosion, 1055
  Gift of £3,675 from the United Kingdom Atomic Energy Authority t the Department of Chemical Engineering, for research on the characteristics of 'Spraypak', 1055
  Gift of £775 from the Ministry of Supply to the Department of Chemica Engineering, for research on the design of distillation towers, 105
  Gift of £3,225 from the United Kingdom Atomic Energy Authority t the Department of Physical Metallurgy, for research on the propertie of ionic crystals, 1055
University of Bristol Long Ashton Research Station—Field Day, 290
University of California and the United States Atomic Energy Commission Announcement of the detection of the Negative Proton, or Antiproton, 860
University of Cambridge . Gift of ten annual subscriptions of £10,000 eac from Mullards, Ltd., for work in radio astronomy, 286
  New Buildings of the School of Veterinary Medicine to be opened b H.M. the Queen, 381
  I C.I. Fellowship Awards, 381
  Symposium at the Observatories on Astronomical Seeing, 864
  Summer School on the Applications of Spectroscopy to Chemica Problems and on Intermolecular Forces and the Properties of Fluids 1104
  Award of 40,000 dollars by the Rockefeller Foundation of New York for the Medical Research Council's unit in the Cavendish Laboratory, to aid the researches on proteins, 1112
University of Cambridge (Department of Geodesy and Geophysics) : Colloquium on the Geological, Dynamical and Palaeomagnetic Aspects of Polar Wandering, 422
University of Chicago : Courses in Radiological Physics and Health Physics, 493
University of Delhi : Publication of *The Anthropologist*, 380
University of Durham . Bedson Club Lectures of King's College, Newcastle-upon-Tyne, 586
  Retirement of Prof. W E. Curtis from the chair of physics at King's College, Newcastle-upon Tyne, 815
University of Edinburgh Appointment of Dr. K G. Denbigh to the chair of chemical technology, 583
University of Exeter (Prof. Hubert T S Britton), 899
University of Glasgow : Appointment of G W. Crosbie as lecturer in biochemistry, 957
  Appointment of N G. Waton as lecturer in experimental pharmacology, 957
  Appointment of N. Grassie as lecturer in macromolecular chemistry, 957
  Appointment of J Aitchison as lecturer in mathematics, 957
  Appointment of H. A. de Borde, B. H Bransden, D. Dixon and W. S. C. Williams as lecturers in natural philosophy, 957
  Appointment of I A. Boyd and Ann B. MacNaught as lecturers in physiology, 957
  Appointment of L M. Kellas as lecturer in veterinary histology and embryology, 957
  Appointment of Dr. A. Bhati to an I.C.I fellowship in chemistry, 957
  Appointment of Prof. G. Pontecorvo to the chair of genetics, 1101
University of Hull . Appointment of Dr. G. F. J. Garlick to the chair of physics, 1197
University of Leeds Appointment of D. C. Johnson as professor of mechanical engineering, 194
  Appointment of Dr. D. Bradley as lecturer in mechanical engineering, 194
  Appointment of Dr. D. A. Jones as lecturer in electrical engineering, 194
  Appointment of S. C. Mitchell as lecturer in fuel technology, 194
  Appointment of Dr J. H Robertson as lecturer in the Department of Inorganic and Structural Chemistry, 194
  Appointment of T Wilson as lecturer in electrical engineering, 194
  Gift of £300 from the Yorkshire Agricultural Society for the Department of Agriculture, 194
  Gift of £700 from Joseph Booth and Brothers for the Department of Civil Engineering, to maintain a student to undertake research work on the dynamic stresses induced in cranes, 194
  Gift of £3,000 from the North-Eastern Division of the National Coal Board for the Department of Mining, 194
  Gift of £940 from the Royal Society for the Department of Physics, for research on the magnetic properties of metals and alloys at high temperatures, 194
  Annual Report of the Librarian for the Session 1953–54, 241
  Title of reader in textile industries conferred on Dr. H. N. Chamberlain, 862
  Appointment of Dr. D A Armstrong as Brotherton research lecturer in physical chemistry, 862
  Appointment of Dr. P. Gray as lecturer in physical chemistry, 862
  Appointment of Dr. B W. Langley as lecturer in organic chemistry, 862
  Appointment of R D Mackay as lecturer in civil engineering, 862
  Appointment of Dr R M. Tennent as lecturer in physics, 862
  Gift of £1,000 from Glover and Main, Ltd., for North Block I (Fuel Science), 1055
  Gift of 6,000 dollars from the Dow Chemical Co., Michigan, to the Department of Physical Chemistry, for further research in paramagnetic resonance, 1055
  Gift of £6,627 from the Wool Textile Research Council to the Department of Textile Industries, for research under Prof. J. B. Speakman, and £3,340 for research under Prof A. H Nissan, 1055
  Gift of £900 from the Wool Textile Research Council to the Department of Colour Chemistry and Dyeing for research, 1055
  Gift of £900 from the Cement and Concrete Association to the Department of Civil Engineering, for the salary of a lecturer, 1055
  Gift of £100,000 from the Anglo-American Corporation of South Africa, Ltd , for the foundation of a Research Institute of African Geology under the direction of Prof. W. Q. Kennedy, 1152
University of Liverpool : Appointment of Dr J. D Craggs to the Robert Rankin chair of electronic engineering, 448, 953
  Appointment of D. L Hughes to the chair of veterinary pathology, 448, 535

  - Appointment of Dr. F. D. S. Batement as senior lecturer in radiochemistry in the Department of Inorganic and Physical Chemistry, 448
- University of London : Appointment of Dr. J. H. Argyris to the chair of aeronautical engineering at the Imperial College of Science and Technology, 13
  - Appointment of Prof. D. G. Christopherson to the chair of applied science in the Mechanical Engineering Department at the Imperial College of Science and Technology, 13
  - Appointment of Prof. A. Porter to the chair of light electrical engineering at the Imperial College of Science and Technology, 13
  - Third International Conference on Plant-Growth Substances, at Wye College, 16, 529
  - Appointment of Prof. D. P. Craig to the University chair of chemistry with special reference to theoretical chemistry at University College, 57, 191
  - Appointment of Dr. B. G. Peters to the University chair of parasitology at the Imperial College of Science and Technology, 57, 145
  - Appointment of Dr. E. A. R. Braude to the University chair of organic chemistry at the Imperial College of Science and Technology, 57, 285
  - Appointment of G. Keith Allen to the University readership in mining at the Imperial College of Science and Technology, 57
  - Appointment of Dr. J. H. Burgoyne to the University readership in chemical engineering at the Imperial College of Science and Technology, 57
  - Appointment of Dr. G. L. Kingston to the University readership in physical chemistry at the Imperial College of Science and Technology, 57
  - Appointment of Dr. J. S. Webb to the University readership in applied geochemistry at the Imperial College of Science and Technology, 57
  - Retirement of Prof. S. J. Davies from the chair of mechanical engineering in King's College, 145
  - Appointment of Prof. L. J. Kastner to the chair of mechanical engineering in King's College, 145
  - Title of professor emeritus in the University conferred on Prof. J. H. Dible, Prof. Herbert Dingle, Prof. V. C. Illing and Prof. H. H. Read, 194
  - Title of reader in botany in the University conferred on Sir Nigel Ball, 194
  - Title of professor of physics in the University conferred on Dr. W. C. Price, 194, 285
  - Appointment of Prof. J. Duchesne to the visiting professorship of Belgian studies in the University, 194
  - Appointment of Dr. Geoffrey Wilkinson to the University chair of inorganic chemistry at the Imperial College of Science and Technology, 194, 285
  - Appointment of Dr. W. G. Overend to the University readership in organic chemistry at Birkbeck College, 194
  - Appointment of Dr. W. S. Pitcher to the University readership in geology at King's College, 194
  - Appointment of Dr. Roger Warwick to the University chair of anatomy at Guy's Hospital Medical School, 336
  - Appointment of Dr. R. H. Gorrill to the University readership in bacteriology at Guy's Hospital Medical School, 336
  - Grant of 30,000 dollars from the Rockefeller Foundation to the Galton Laboratory of University College, for research in genetics, 379
  - Retirement of Prof. H. H. Read from the chair of geology in the Imperial College of Science and Technology, 490
  - Retirement of Prof. V. C. Illing as professor of geology (oil technology) in the Imperial College of Science and Technology, 490
  - Appointment of H. L. Elvin to the University chair of education with special reference to education in tropical areas, in the Institute of Education, 539
  - Appointment of Dr. A. H. M. Arnold to the University readership in electrical engineering at King's College, 539
  - Lectures by Dr. Gabriel Kron at the Imperial College of Science and Technology on the Method of Tearing, 632
  - British Postgraduate Medical Federation Lectures on the Scientific Basis of Medicine, Vol. 2 (1952–53), Vol. 3 (1953–54), *review* by Dr. R. T. Grant, 803
  - Appointment of C. H. Barnett to the University readership in anatomy at St. Thomas's Hospital Medical School, 862
  - Appointment of Dr. R. S. F. Schilling to the University readership in occupational health at the London School of Hygiene and Tropical Medicine, 862
  - Inaugural Address for the new Session of the Imperial College of Science and Technology (Dr. R. P. Linstead), 913
  - Title of professor of biology in the University conferred on Prof. G. E. H. Foxon, 957
  - Title of professor of geography in the University conferred on Prof. A. E. Smailes, 957
  - Appointment of Dr. P. M. Butler to the University readership in zoology, 957
  - Appointment of Dr. S. W. Hinde to the University readership in public health, 957
  - Appointment of N. P. W. Moore to the University readership in mechanical engineering, 957
  - Appointment of Dr. R. K. S. Wood to the University readership in plant pathology, 957
  - Election of Dr. J. F. Lockwood as vice-chancellor for the remainder of the University year 1955–56, 957
  - Appointment of W. F. Grimes as director of the Institute of Archaeology and professor of archaeology in the University, 1005
  - Appointment of Dr. E. O'F. Walsh to the University readership in biochemistry at the Royal Free Hospital School of Medicine, 1005
  - Heath Clark Lectures, 1953 (Dr. Paul F. Russell), *review* by Dr. E. Ashworth Underwood, 1040
  - Appointment of Dr. E. J. Bourne to the University chair of chemistry at the Royal Holloway College, 1104, 1197
  - Award of £4,600 by the Rockefeller Foundation of New York to St. Mary's Hospital Medical School, for the purchase of special equipment by the Department of Chemical Pathology, 1112
  - Award of £2,700 from the Rockefeller Foundation of New York to University College, for the purchase of a 'Spinco' ultracentrifuge by the Department of Zoology, 1113
  - Appointment of Dr. B. C. King to the University chair of geology at Bedford College, 1248
  - Appointment of Dr. K. W. Sykes to the University chair of physical chemistry at Queen Mary College, 1248
  - Title of reader in biochemistry in the University conferred on Dr. A. L. Greenbaum, 1248
- University of London (Department of Extra-Mural Studies), (British Institute of Recorded Sound, in conjunction with the) Lectures by Eric Simms on the Language of Birds and other Animals, 677
- University of London Institute of Archæology : Appointment of W. F. Grimes as director and University professor of archæology, 1005
- University of London Institute of Education . Appointment of H. L. Elvin to the University chair of education with special reference to education in tropical areas, 539
- University of Lucknow : Appointment of Dr. M. B. Lal as professor of zoology, 907
- University of Melbourne : Appointment of Dr. W. E. Tribe as reader in the physiology of domestic animals, 910
- University of Michigan · Publications in Mathematics, No. 2, Infinite Abelian Groups (Irving Kaplansky), *review* by Dr. L. S. Goddard, 573
- University of New Zealand · The Academic Record of Science Students in the (I. D. Dick, R. M. Williams and Dermot Straker), 448
  - Appointment of Prof. F. J. Llewellyn as rector of Canterbury University College, Christchurch, 725
- University of Nottingham . Resignation of Prof. F. E. King from the Sir Jesse Boot chair of chemistry, 535
  - Appointment of Dr. A. W. Johnson to the Sir Jesse Boot chair of chemistry, 535
- University of Oxford · Gift of £100,000 from the Rockefeller Foundation, for a variety of purposes, 769
  - The sum of £2,500 a year to be increased by Arthur Guinness, Son and Co., Ltd., to £4,000 a year, for three research fellowships in microbiological chemistry in the Department of Biochemistry, 769
  - Gift of 2,000 dollars from the National Council to Combat Blindness, Inc., towards the purchase of apparatus for research at the Nuffield Laboratory of Ophthalmology, 769
  - Gift of 10,000 dollars from the International Bank for Reconstruction and Development, for a survey of British experience in the management of capital investment overseas, which is to be carried out at Nuffield College, 769
  - Gift of £4,850 from the Nuffield Foundation, for research work in the Department of Human Anatomy, 769
  - Gift of £700 a year for seven years from Major H. W. Hall, towards the purchase of an optical spectrograph for use in the research laboratory for archæology and the history of art, 769
  - Gift of £1,000 a year for seven years from the British Oxygen Co., Ltd., for the continuation of low-temperature research in the Clarendon Laboratory, 769
  - Appointment of Dr. R. K. Schofield as reader in soil science in the Department of Agriculture, 910
  - Appointment of Dr. D. D. Woods to the Iveagh professorship of chemical microbiology, 1002
  - Award of £3,000 by the Rockefeller Foundation to the Chemical Crystallography Laboratory, 1112
  - Thirtieth Annual Report of the Imperial Forestry Institute (1953–54), 1153
- University of Oxford School of Forestry (Prof. H. G. Champion), 721
- University of Padua : Offer of a Gabrielle Zuccari Scholarship for research at the Zoological Station, Naples, 149
- University of Pittsburgh : Appointment of Prof. John Wotiz as associate professor of chemistry, 862
  - Appointment of Mook-Sang Tsao as assistant professor of chemistry, 862
- University of Reading : Annual Report of the National Institute for Research in Dairying, 962
- University of St. Andrews : Appointment of Dr. Charles F. Davidson to the chair of geology, 954
  - Symposium at Queen's College, Dundee, on Pulmonary Circulation and Respiratory Function, 960
  - Appointment of Dr. J. H. Burnett to the chair of botany, 1002
- University of Sheffield · Jubilee of the (Dr. D. H. Peacock), 94
  - Appointment of D. N. de G. Allen to the chair of applied mathematics, 98
  - Appointment of Dr. G. Porter to the chair of physical chemistry, 101, 378
  - Appointment of Dr. V. R. Pickles as senior lecturer in physiology, 101
  - Appointment of Dr. G. M. Leak as lecturer in physics, 101
  - Appointment of Dr. W. F. Ford as lecturer in refractory materials, 101
  - Appointment of Dr. L. Ainsworth as lecturer in glass technology, 101
  - Appointment of Miss H. G. Medlicott as map curator and librarian in the Department of Geography, 101
  - Scholarships in glass technology offered by the Worshipful Company of Glass-Sellers of London, 770
  - Appointment of T. R. Kaiser as senior lecturer in physics, 910
  - Appointment of R. C. Curran as senior lecturer in pathology, 910
  - Appointment of Dr. R. C. Cass as lecturer in chemistry, 910
  - Appointment of Dr. T. P. H. McKellar as lecturer in psychology, 910
  - Appointment of Dr. V. A. Phillips as lecturer in metallurgy, 910
  - Appointment of Dr. A. N. Stroh as lecturer in physics, 910
  - Title of emeritus professor of engineering conferred on Prof. H. W. Swift, 1056
  - Title of emeritus professor of glass technology conferred on Prof. H. Moore, 1056
- University of Southampton : Appointment of Dr. N. B. Chapman as reader in organic chemistry, 336
- University of the Witwatersrand : Appointment of Prof. J. O'M. Bockris to the chair of physical chemistry, 629
- University in Basic Research · The Role of the (Prof. K. S. Pitzer), 295
- University Affairs in Great Britain 1953–54, 450
- University Autonomy in South Africa, 613
- University College, Dublin, and the Institute of Chemistry of Ireland : Symposium on the Chemistry of Naturally Occurring Pyrones, 637

University College, London : Appointment of Prof. D. P. Craig to the University of London chair of chemistry with special reference to theoretical chemistry, 57, 191
  Title of professor emeritus in the University of London conferred on Prof. Herbert Dingle, 194
  Grant of 30,000 dollars from the Rockefeller Foundation to the Galton Laboratory, for research in genetics, 379
  Award of £2,700 by the Rockefeller Foundation of New York to the Department of Zoology, for the purchase of a 'Spinco' ultracentrifuge, 1113
  Title of reader in biochemistry in the University of London conferred on Dr. A. L. Greenbaum, 1248
  Drummond Fellowships for Research in Nutrition, 1249
University College of North Staffordshire : Appointment of Sir George Barnes as principal, 862
University College of North Wales : Appointment of Dr. M. R. Gavin to the chair of applied electricity, 334
  New Science Buildings (Prof. P. W. Richards), 527
University College of Rhodesia and Nyasaland : Appointment of Dr. E. Leighton Yates to the chair of physics, 14
  Appointment of Dr. E. B. Edney to the chair of zoology, 98
  Appointment of Prof. A. S. Boughey to the chair of botany, 99
  Appointment of Dr. Walter Adams as director of planning and principal-designate, 336
University College, Swansea : Appointment of Dr. W. Fishwick to the chair of electrical engineering, 430
University Education : The Broadening of, 1
  The Purpose of, 707
University Grants Committee : Returns from Universities and University Colleges in receipt of Treasury Grant, Academic Year 1953–54, 450
University Institutions British Colonial, 675
University Museum, Oxford (Dr. William Holmes), 331
University System 1914–1954 : The British (Sir Hector Hetherington), 522, 567
Unpaired Electron : A New Class of Compounds containing the Pentacyanoferrate Group and an (Dr. E. F. G. Herington), 80
*Upeneus moluccensis* in the Eastern Mediterranean : Two Indo-Pacific Fishes, *Dasyatis uarnak* and (Dr. A. Ben-Tuvia), 1177
Upland Heaths Tree Root Development on (C. W. Yeatman), 675
Uraninites : Age of, from Dimensions of their Unit Cells (S. A. Helmstra), 405 ; (Dr. B. Wasserstein), 405
Uranium Content of Two Iron Meteorites (Dr. George W. Reed and Dr. Anthony Turkevich), 794
Urban Setting : Juvenile Delinquents in their, *review* by A. N. Oppenheim, 91
Urea : Dissociation of Deoxyribonucleic Acid by (Dr. P. Alexander and Dr. K. A. Stacey), 162
Urea Solution : Molecular Weight of Ovalbumin and of Bovine Serum Albumin in (H. A. McKenzie, M. B. Smith and R. G. Wake), 738
Urea Synthesis : Role of Glutamine in (Dr. S. J. Bach and Margaret Smith), 1126
Uredospores : Self-Inhibition in Germinating Rust (F. R. Forsyth), 1103
Uriel, J., and others A Study of Normal Human Cerebrospinal Fluid by the Immuno-Electrophoretic Method, 976
Urinary Œstrogens in the Buffalo as measured Chemically (Dr. E. S. E. Hafez and T. Attar), 796
Urine (Human) : Identification of N²-Methylguanine (2-Methylamino-6-hydroxypurine) as a Normal Constituent of (Bernard Weissmann, Philip A. Bromberg and Alexander B. Gutman), 1217
Uritani, Dr. Ikuzo (Akazawa, Takashi, and) : Respiratory Increase and Phosphorus and Nitrogen Metabolism in Sweet Potato Infected with Black Rot, 1071
Usborne, Henry, and others : The Bomb—Challenge and Answer (edited by Gilbert McAllister), 522 ; *review* by R. Brightman, 894
Use of a Computing Machine as a Mechanical Dictionary (Dr. Andrew D. Booth), 565 ; (Dr. J. C. Kendrew), 984
Use of the Glees Silver Technique in the Hypothalamus (W. M. Cowan and T. P. S. Powell), 1124
Use of M.K.S. Units : The Teaching of Electricity, with special reference to the (Science Masters' Association), *review* by Prof. L. F. Bates, 617
Use of Man-power : The Effective (Alec Rodger), 444
Use of Radioactive Materials in Biological Assay (Society for Analytical Chemistry, the Royal Institute of Chemistry, the Society of Chemical Industry and the Chemical Society Symposium on), 427
Use and Abuse of English in Science, 845
Use and Abuse of Protective Equipment (British Occupational Hygiene Society Conference on), 448, 1251
Use and Welding of Aluminium in Shipbuilding (Institute of Welding, the British Welding Research Association, the Institution of Naval Architects, the British Shipbuilding Research Association and the Aluminium Development Association Symposium on), 957
Usinger, Prof. Robert L., and others : Methods and Principles of Systematic Zoology, *review* by Dr. H. W. Parker, 711
U.S.S.R. : British Agricultural Delegation to visit the, 491
  Scientific Research in the, 14
  Visit of British Atomic Scientists to the, 954
Uterine Segments (Surviving) : *In vitro* Stimulation of Incorporation of Formate-$^{14}$C in, by Hydroxylated Œstradiols (Dr. Gerald C. Mueller), 127
Utida, S., and others : Reaction of Starfish Spermatozoa to Histidine and certain other Substances considered in relation to Zinc, 1068
Utilization and Evaluation of Grassland (British Association for the Advancement of Science, Section M (Agriculture), Discussion on), 764
Utopia : The New (Prof. M. S. Viteles), 450

VACANT Lattice Sites in Crystalline Solids (Prof. N. F. Mott), 439
Vacation Courses in Synoptic Meteorology (Royal Meteorological Society and the Council for the Promotion of Field Studies), 1248
Vaccine (*Brucella*) : Concentration of (Dr. G. C. van Drimmelen), 469
Vacua (Ultra-High) : Production and Measurement of (Dr. J. A. Becker), 452
Vacuole of Parazoa and Protozoa : The Contractile, and the Golgi Apparat (Prof. J. Brontë Gatenby, and Dr. A. J. Dalton and Dr. M. D. Felix 301
Vadász, J., and Juhász, I. : Plasma Globules of *Salmonella enteritidis* arisin under the Influence of Penicillin and their Reversion to the Origin Bacillary Forms, 168
Vadász, J. (Juhász, I., and) : Regeneration of the Filtrable Forms of *Salmonell enteritidis* in Media containing Blood Plasma (Fibrin Structure), 20
Vagal Stimulation : Effect of, on the Sinus Venosus of the Frog's Hea (Dr. O. F. Hutter and Dr. W. Trautwein), 512
Valency Changes of Molybdenum during the Enzymatic Reduction of Nitrat in *Neurospora* (Dr. D. J. D. Nicholas and Dr. H. M. Stevens), 1066
Vallee, Bert L. (Hoch, Frederic L., and) : Effects of Adenosine Triphosphat and Metals upon an Electron Transport System in Mitochondria, 25
Valleys (Meandering) : Bed-width and Wave-length in (Dr. G. H. Dury), 3
Value of Science : The Intrinsic, 409
van Bekkum, D. W. : Progress in Radiobiology, 683
Van Cittert, P. H., and others (edited by Kronig, R., in collaboration with) Textbook of Physics (translated from the third Dutch edition) *review* by Prof. G. O. Jones, 184
van Drimmelen, Dr. G. C. : Concentration of *Brucella* Vaccine, 469
van Emden, Dr. F. I. : Importance of Larval Characters in Classification, 91
Van Heel, A. C. S., and others (edited by Kronig, R., in collaboration with) Textbook of Physics (translated from the third Dutch edition) *review* by Prof. G. O. Jones, 184
van Hoepen, E. C. N. : New and Little-known Ammonites in South Afric 585
van Houten, J. C., and others : Effect of Inhibition of Cholinesterase on th Motility of the Small Intestine, 468
van Krevelen, D. W. : Coal Science, 104
van Lammeren, Prof. W. P. A. : Cavitation in Hydrodynamics, 809
van Overbeek, Dr. J. : Plant Growth Substances, 530
van Raalte, Dr. M. H., and others : A New Type of Plant Growth-regulatin Substances, 308
van Soest, Prof. J. L. : Information Theory, 773
van Straelen, A. : Problems of International Concern in the Biologic Sciences, 242
Van Straelen, Victor : Volume Jubilaire, *review* by Dr. L. Harriso Matthews, 413
van de Hulst, Prof. H. C. : Magneto-Hydrodynamics, 235
  Presented with the Eddington Medal for 1955 of the Royal Astronomica Society, 378
Van de Wall, G., and Alvord, Jnr., E. D. : A Survey of the Food and Fee Resources of the Union of South Africa, *review* by Sir John Russell 90
van den Boomgaard, Dr. J. : Intermetallic Semiconductors, 343
van der Kerk, Dr. G. J. M., and others : A New Type of Plant Growth-regulating Substances, 308
Van der Leeden, P., and others (edited by Kronig, R., in collaboration with) Textbook of Physics (translated from the third Dutch edition), *review* by Prof. G. O. Jones, 184
van der Pol, Prof. Bălth Information Theory, 773
van der Veen, Dr. R., and others : A New Type of Plant Growth-regulating Substances, 308
  A New Acaricide, 2,4,5,4′-Tetrachlorodiphenylsulphone, 515
van der Walt, J. P., and de Kruyff, C. D. : Anaerobic Metabolism of Thiocyanate by Thiobacilli, 310
Vapour-Phase Partition Chromatography A New Detector for (R. P. W. Scott), 793
Variable Dosage Sprayer for Agricultural Experiments (Dr. R. Pfeiffer, R. T. Brunskill and Dr. G. S. Hartley), 472
Variants of Pseudorabies Virus : Interference between, demonstrable in Tissue Culture (Dr. George Ivanóvics, Helena Béládi and Ervin Szöllösy), 972
Variation in Ascocarpal Fungi Speciation and (edited by R. W. Miner), 240
Variation of *f*Es during Solar Eclipses (W. Stoffregen), 610
Variation of Flow Birefringence with Stress (Dr. A. S. Lodge), 838
Variations in the Direction of Venous Blood Flow in the Mammary Region of the Sheep and Goat (J. L. Linzell and L. E. Mount), 37
Varied-Carpet Beetle Larvæ (*Anthrenus verbasci* L.) : Inability of, to digest Chitin (Ch. Jeuniaux), 1129
Varley, Prof. G. C. : Importance of Larval Characters in Classification, 912
Varley, Dr. J. H. O. : Radiation Damage in Metals, 1147
Varma, T. N. R., and others : High-potency Vitamin A, Oils from Indian Freshwater Fish, 554
Vascular Plants Temperature-Ranges and Distributions of some (E. P. Jeffree), 703
Vascular Plants of North-West Europe (Nils Hylander), 492
Vasodilatation (Cold), in the Finger : Effect of Anti-histamine Substances on (G. C. Whittow), 511
Vectors of Onchocerciasis : The Black Flies (Diptera, Simuliidae) of Guatemala and their Role as (Herbert T. Dalmat), *review* by Dr. John Smart, 1238
Vectors of Plant Viruses : A Combined Aspirator and Feeding Cage for the Collection and Testing of Insects as (J. T. Legg), 609
Veeger, C., and others : Metabolism of Triaryl Phosphates in Rodents, 259
Vegetable Oils (Heated) : Nutritive Value of (N. V. Raju and R. Rajagopalan), 513
Vegetable Oils and Pigments : Effect of Sunlight on Mixtures of (Prof. Frank A. Lee), 463
Vegetation of the Assam Valley (Prof. E. P. Stebbing), 200
Vein (Portal), of Adult Mammals (Rodents) : Demonstrations *in vivo* and *in vitro* of Peristaltic Contractions in the (Prof. G. Attardi), 76
Vejdělek, Z. J. (Macek, K., and) : Application of Paper Chromatography to Structural Problems in the Veratrum Alkaloid Group, 1173
Veldstra, Prof. H. : Plant Growth Substances, 530
Venezuelan Institute for Neurology and Brain Research (Dr. Geoffrey H. Bourne), 1049
Venkataraman, Prof. K. : Chemistry of Naturally Occurring Pyrones, 637
Vennesland, B. : Physical Chemistry of Enzymes, 959
Venous Blood-flow in the Mammary Region of the Sheep and Goat : Variations in the Direction of (J. L. Linzell and L. E. Mount), 37
Venous System of *Rana tigrina* Daud (Surendra Sharma and P. N. Tiku), 135

ratrum Alkaloid Group : Application of Paper Chromatography to Structural Problems in the (K. Macek and Z. J. Vejdelek), 1173
razide (1-isoNicotinoyl-2-veratrylidene Hydrazide) . Anti-Tuberculous Activity of (Dr. S. D. Rubbo and Dr. J. Cymerman-Craig), 887
ress, Zoltán : Awarded a second-class Kossuth Prize for Research, 14
arma, Dr. G. S. : Determination of Elastic Constants of Solids by Ultrasonic Diffraction Methods, 27
arma, J. P., and others . Structure of Sterculic Acid, 1082
ermeil, C. : Chemical Effects of Ionizing Radiation, 197
rnalization and Short-day Treatments · Ear Formation in Timothy Grass (*Phleum pratense*) following (Dr. R. H. M. Langer), 263
ernon, C. A. (Jones, Dr. D. Emyr, and) . Nucleophilic Substitution in Vinylic Halides, 791
ernon, T. R. Spore Formation in the Genus *Streptomyces*, 935
ertebrates *in the Triassic of Israel* : Occurrence of (Dr. F. Brotzen), 404
ertebrates (Lower) · Nerve Endings as Transducers of Thermal Stimuli in (Dr. R. W. Murray), 698
erwey, Dr. J. : Migration, 773
esey-Fitzgerald, L. D. . Aggregation and *Gregarious Behaviour of Locusts*, 590
esicular Stomatitis in Kidney Monolayer Tissue Cultures : Growth and Titration of the Viruses of Foot-and-Mouth Disease and (R. F. Sellers), 547
estermark, Anders, and others · Glutamine as an Accelerator of Chondroitin Sulphate Synthesis, 601
eterinary Pathology at Liverpool, 535
eterinary *Reviews and Annotations* (Commonwealth Agricultural Bureaux), No. 1, 99
eterinary Studies at Cambridge (Prof. L. P. Pugh), 806
iability *of Neurotropic* Rift Valley Fever A Brain Factor influencing the (Dr. A. Polson and T. L. Madsen), 645
iability Indicators Tetrazolium Salts as—Radiation-catalysed Reactions (Johnson Parker), 647
ibration and Health : Noise, 1151
ibrational Spectra (Molecular) · Theory of, *review* by Dr. J. W. Linnett, 1185
ibrations : Molecular (Prof. E. Bright Wilson, Jr., Prof. J. C. Decius and Prof. Paul C. Cross), *review* by Dr. J. W. Linnett, 1185

ickers, Ltd., and others : Establishment of an Industrial Fund for the Advancement of Scientific Education in Schools, 860
ickery, B. C. : The Tower of Babel—the Language Barrier in Science, 939
ictory over the Plague, *review* by Dr. E. Ashworth Underwood, 615, 957
illanueva, J. R. : A New Method for the Microbiological Assay of Thiamin (Vitamin $B_1$), 465
incent, D. L., and others : Algal Chemistry, 1106
ink, Dr. H. J. . *Intermetallic Semiconductors*, 343
inson, J. L. J. : Appointed director, Mauritius Institute, 910
inter, Dr. Jean · Kind Killing, revised edition, 862
Vinyl Polymerization . Termination Reaction in—Preparation of Block Copolymers (Dr. C. H. Bamford and A. D. Jenkins), 78
inylic Halides : Nucleophilic Substitution in (Dr. D. Emyr Jones and C. A. Vernon), 791
*ipera berus* · Placentation in the Adder (Ruth Bellairs, I. Griffiths and A. d'A. Bellairs), 657
*Virology*, 56
Virtanen, Prof. Artturi I. : A New Imino-Acid in some Liliaceae, 984
Virus *of Foot-and-Mouth Disease* : Control of Yeast Contamination by 'Mycostatin' in Cultures of the (Jacqueline O. Wigmore and W. M. Henderson), 516
Virus (*Mel* and *NWS* Strains of Influenza A) : Apparent Reciprocal Exchange of Characters between the, *in the Brain of* One-day Old Mice (Dr. K. B. Fraser), 212
Virus (Mumps) : Reproduction of, in the Chorio-allantoic Membrane (Dr. H. L. Wolff), 604
Virus (Myxoma) · Occurrence of Attenuated Strains of, in Europe (Prof. Frank Fenner and I. D. Marshall), 782
Virus (Myxoma), in Britain (J. R. Hudson, Harry V. Thompson and W. Mansi), 783
Virus (Pseudorabies) · Interference between Variants of, demonstrable in Tissue Culture (Dr. George Ivanóvics, Helena Béládi and Ervin Szöllősy), 972
Virus (Tobacco Mosaic) : Distribution of Radiocarbon in (Miss G. Wustinger, H. Schonfellinger and Prof. E. Broda), 306
  Terminal Groups of (Prof. G. Schramm, G. Braunitzer and J. W. Schneider), 456
Virus Protein (*Southern Bean Mosaic*) . Molecular Arrangement in Crystals of the (Dr. Louis W. Labaw and Dr. Ralph W. G. Wyckoff), 455
Virus Studies in the Queen's University, Belfast, 673
Virus-like Particles in Rous Fowl Sarcoma Cells : Site of (M. A. Epstein), 784, erratum, 862
Viruses of Foot-and-Mouth Disease and Vesicular Stomatitis in Kidney Monolayer Tissue Cultures : Growth and Titration of the (R. F. Sellers), 547
Viruses (Plant) : A Combined Aspirator and Feeding Cage for the Collection and Testing of Insects as Vectors of (J. T. Legg), 609
Visco-elastic Behaviour (British Society of Rheology Discussion on), 61
Viscose Research Laboratory of Courtaulds, Ltd. · New, 17
Visible Spectrum of Potassium Ethyl 1-Methoxypicrate and of related Compounds (R. Foster), 746
Vision . Lighting and (British Association for the Advancement of Science, Section I (Physiology), Discussion on), 717
Vision (Colour) · Colorimetry and Theories of (Dr. D. B. Judd), 100
  The Ishihara Test and Defects in (Peter Cavanagh), 816
Visiting Scientists, Society for : Annual Report for 1954–55, 908
Visual Education (*Health Education Journal*, Vol. 13, Vol. 1, *Symposium on*), 537
Visual Recording of Radiation Patterns (Prof. W. V. Mayneord), 14
Visual Thresholds : A Statistical Information Theory of (R. L. Gregory and Violet Cane), 1272
Viswanatha, T., and Liener, I. E. : Site of Inhibition of Trypsin by Diethyl p-Nitrophenylphosphonate, 1120
Vitamin : Structure of Vitamin $B_{12}$—The Crystal Structure of the Hexacarboxylic Acid derived from $B_{12}$ and the Molecular Structure of the (Dr. Dorothy Crowfoot Hodgkin, Jenny Pickworth, John H. Robertson, Prof. Kenneth N. Trueblood, Richard J. Prosen and John G. White), 325
Vitamin $A_1$ Isomer A Possible New, in the Eyes of Crustaceans (Georg Lambertsen and Olaf R. Braekkan), 553
Vitamin $A_2$ *Oils from Indian Freshwater Fish* · High-potency (S. Balasundaram, Dr. H. R. Cama, P. R. Sundaresan and T. N. R. Varma), 554
Vitamin $B_1$ : A New Method for the Microbiological Assay of Thiamin (J. R. Villanueva), 465
Vitamin $B_{12}$ . Biological and Microbiological *Methods of Estimating* (Biological Methods Group of the Society for Analytical Chemistry Conference on), 384
  Protective Action of, in the Hyperthyroid Rat (Dr. Prema Patterpaker, Urmila Marfatia and Prof. A. Sreenivasan), 165
  The Reduction of (G. H. Beaven and E. A. Johnson), 1264
  Structure of—The Crystal Structure of the Hexacarboxylic Acid *derived from* $B_{12}$ and the Molecular Structure of the Vitamin (Dr. Dorothy Crowfoot Hodgkin, Jenny Pickworth, John H. Robertson, Prof. Kenneth N. Trueblood, Richard J. Prosen and John G. White), 325 ; The Structure of Vitamin $B_{12}$ and its Hexacarboxylic Acid Degradation Product. (R. *Bonnett*, Dr. J. R. Cannon, Dr. A. W. Johnson, I. Sutherland, Sir Alexander Todd and Dr. E. Lester Smith), 328
Vitamin $B_{12}$ (Chlorine-substituted) : Some Observations on the Crystal Structure of a (M. J. Kamper and *Dr. Dorothy Crowfoot Hodgkin*), 551
Vitamin $B_{12}$ and its Hexacarboxylic Acid Degradation Product : Structure of Vitamin $B_{12}$—The Structure of (R. Bonnett, Dr. J. R. Cannon, Dr. A. W. Johnson, I. Sutherland, Sir Alexander Todd and Dr. E. Lester Smith), 328
Vitamin E Third International Congress on, 149
*Vitamins* The Story of the, *review* by Prof. John Yudkin, 524
Vitamins in Theory and Practice (Dr. Leslie J. Harris), fourth edition, *review* by Prof. John Yudkin, 524

Some of our difficulties arise because we have not met the challenge to fresh thinking which changed conditions have brought. The appeal which Lord Woolton and Sir John Stopford have recently launched to raise one million pounds over the next ten years to finance the building of halls of residence at the University of Manchester expresses, indeed, an attempt to meet two such challenges from changed conditions. Lord Woolton commended the appeal as an attempt to build a residential university which would more surely supply the leaders and teachers which we are failing to find in sufficient numbers, and he referred particularly to the value of residential colleges for the acquisition of that knowledge of how to live in a world where human relations are as important as intellectual capacity.

Halls of residence of themselves will not necessarily bridge the gulf unless their purpose is clearly understood and they receive the full support of the community. The two main challenges which they are intended to meet were clearly indicated by Sir John Stopford. First, there is that of specialization. We are in danger, he said, of becoming such isolated units as to produce a generation incapable of understanding education as it was understood by earlier generations. The danger was strikingly emphasized by Sir Walter Moberly in his book six years ago; but although in some universities, such as at Glasgow, something has been done to explore the problem, as Mr. J. F. Sleeman's article in the *Universities' Review* of February shows, very little effective action has been taken to break down the isolation.

Halls of residence will provide one opportunity, but we have still to ensure that it is used; that may well depend on the university staff and on the home as much as on the student. This is no less true of the second challenge. We are offering students to-day very good educational facilities; but it is not only at Manchester that too few are exposed to those broadening and cultural influences which full participation in a corporate life and extra-curricular activities can provide, or are learning to undertake responsibility, to find a real purpose in life, to acquire poise and to develop those qualities of character and personality which are essential for leadership. Moreover, we have to take due account of the fact that the striking changes in the social composition of the student body over the past few decades mean that an increasing proportion of undergraduates is drawn from homes without a tradition of study, and where the environment tends to stifle rather than foster character and culture. Nor can we disregard the possibility that such developments as television may be detrimental, rather than conducive, to learning and culture.

To check narrowness and excessive specialization, to encourage breadth and a balanced personality as well as a balanced mind, is not simply a matter of buildings or of grants to students at an appropriate level to encourage them to make use of such facilities; it is a matter of outlook and atmosphere also. Industry itself, for example, could attest the genuineness of its concern for more breadth and balance not only by financial contributions to the building and equipment of halls of residence in the civic universities, but still more by the attention it pays in recruitment to those who have used the opportunities of corporate and more spacious living which residence affords.

That would do much to counter the narrowing effect which home influence or close preoccupation with obtaining a degree may have; but university authorities could probably do even more by their policy in such matters as university entrance, general education or the transfer from one faculty to another. The more that is done to encourage and facilitate communication between one faculty or one specialism and another, the more fruitful are halls of residence and similar means likely to prove in enriching the life and outlook of the student. It should not be forgotten also that, as Dr. Eric Ashby has emphasized, halls of residence are not the only or even the most economic means of providing the stimulus desirable. With the right tactics and encouragement, student centres could provide valuable opportunities at much less cost, while it might equally be possible to organize a fuller use of existing halls of residence. If, for example, we fail to give those specializing in the arts an understanding of science and the scientific method at some stage of their education, failure of communication may well persist, and even in a residential college the arts student and the science student will be unable to take part effectively in those informal debates which go far to correct the defects of specialization.

This is the problem which demands first attention, and it should be noted that even at the staff-level Mr. Sleeman, in the article already noted, admits that real contact and understanding between colleagues in other departments is still difficult so far as deep professional interests are concerned. To remedy this would increase the adaptability of the arts graduate and also correct that danger of a specialized scientific education in Britain—neglect of the full study of man. It should be the first step to making possible that conversion of the arts graduate, through intensive one-year courses in the fundamentals of science, as a means of overcoming the shortage of science teachers, which Dr. B. V. Bowden, principal of the Manchester College of Technology, has suggested.

The solution, however, does not lie in adding fresh courses to the overloaded curriculum of the undergraduate. At that level, it is the way in which science is taught, for example, that matters. As Dr. Eric James has urged, science can be presented as an intellectual discipline in its own right, capable of developing all the breadth and human interest required and with due weight on the limitations as well as the potentialities of science. If this is to be done, however, and the arts student likewise to appreciate the significance of the scientific approach to knowledge and its place in the development of thought and culture, apart from its bearing on living in the modern world, the beginnings must be made in the schools—in the teaching of science in such a way and at such a level that its importance is grasped, as well as the openings and interest it

# THE BROADENING OF UNIVERSITY EDUCATION

AN important chapter in the recent report of the Appleton Committee on the supply of teachers of mathematics and science in Scotland discusses some questions regarding the universities which were raised in the memoranda submitted to the Committee. The three most important of these related to entrance qualifications, to the content of honours degree courses and to the extent to which graduates stay on at the universities to undertake research immediately after taking their first degree. On the last question, the Committee merely observes that conflicting views are held, and it enters no further on a difficult and debatable subject than to suggest that university professors, in considering whether or not to admit students to research courses, should have regard to the urgent national need for scientists in other capacities in the various professions and in industry.

Beyond that, it is clear that there is room for some fresh thinking as to the place of research in university life, or even as to our conception of what we mean by the advancement of knowledge. It is not to be confused with the accumulation of fresh facts in a restricted field; and the Appleton Committee shows that it is aware of this when, discussing the content of honours degree courses, it refers to the real and widespread desire for a less highly specialized honours course which would provide a better all-round knowledge of the subject in question and be concerned less with the immediate introduction to a limited field of research. The Appleton Committee reached no firm conclusion. It regards the difficulty of an honours degree course as its prime characteristic, not its concentration on a limited field on the frontier of knowledge, and suggests as worthy of consideration the institution of an honours B.Sc. degree in two branches of science, less specialized than the present degree in one subject, and yet less general than the so-called general honours course.

Such proposals, however, infringe on the third question—that of university entrance requirements. Here the Appleton Committee is concerned chiefly that lack of opportunity to study, or inability in, a foreign language should not by itself be allowed to debar a person from entering a university to study mathematics, science or technology, if he is otherwise well qualified to do so. It suggests that this is a matter which the universities in Britain might appropriately consider, bearing in mind that the nation requires all the skilled scientists and technologists it can produce.

This difficulty is sometimes due to a false choice made by students—for lack of guidance or in spite of it—at some stage in their career. There will always be such students, and for this reason the Committee suggests that the universities should consider revision of their faculty and class requirements so that as many students as possible can have the opportunity of taking scientific courses. A related problem is that of the later development of latent scientific ability, and there can be no question that easier transfer between university departments would be in the national interest and not merely at the present time as a means of increasing the number of science students.

University entrance is, however, equally of importance in relation to general education. In a recent conference, "Education in a Changing World", at the Manchester Training College, the chairman, Mr. F. Heywood, urged that there should be no narrowing of the curriculum at schools and universities and claimed that industry needs graduates of broad general education rather than specialists. Dr. P. F. R. Venables said that education should train for flexibility, and that there is need for a broad training in other subjects besides technology and science. Prof. F. A. Vick likewise said that the university courses of a student of physics should be a fusion of thoroughness and breadth.

What needs to be remembered above all is that the problem of finding sufficient science teachers for schools in Britain can no more be discussed in isolation than the expansion of higher technological education or of technical education. All such specific problems ultimately must be considered in relation to the educational policy of the country as a whole. There must be some clear understanding of the purpose of education before we can wisely determine the resources which can be allocated to meet particular needs and purposes. Nor will the priorities be wisely assigned without an understanding that goes far outside the ranks of the educationist and embraces not simply the administrator and the politician but also the citizens in general whose sons and daughters are to be educated. Well did Prof. W. R. Niblett write in his recent book, that one of the most urgent needs for education in Britain is a much more whole-hearted effort to secure closer understanding between home and school; but it is equally true that if the universities are to play their full part in educating men and women of quality and purpose, vision and intelligence, belief and will—if they are to release the powers of leadership in more people—it will be in large measure as the community itself understands and co-operates with the university.

Prof. Niblett here makes the point about co-operation which Dr. Margaret Read made so effectively in discussing education and social change before the British Association in Edinburgh four years ago. If the educational system of Britain is really to fit modern society and to meet its needs, it must be understood by the nation and approved to the extent required for such co-operation to be achieved. That is the first task in communication. It has to be remembered constantly that what is educationally desirable may be socially unacceptable; and again that what is socially desirable may be economically unattractive, or even if economically attractive it may be politically unfeasible.

offers as a career, and in making it easier for pupils in the sixth forms to change to, or from, the science side if they wish.

Once again we come back to the critical importance of the science teacher, and a clear understanding of the exact function of the science teacher and his real contribution to the needs of the nation to-day would go far to overcome the difficulty of prestige which Prof. R. E. Peierls and Dr. James stressed as of particular importance in a discussion at the Home Universities Conference last December. If we could secure widespread recognition of the worth of the science teacher by the community generally, one major difficulty in securing enough teachers would be overcome; and at the same time something would have to be done to make science teaching itself more effective. When the teaching career is in itself highly regarded, men and women are both encouraged to give of their best in their teaching, and those efforts are likely to be more fruitful.

It is not, however, simply a matter of more generous support and understanding by the community in general. Special sections, as has already been indicated, bear particular responsibilities. More vision is essential on the part of some sections of the teaching profession itself, and less disposition to insist on uniformity instead of encouraging merit and conspicuous ability. Industry and professional bodies, particularly those concerned with science and technology, have their own part to play, both in securing greater prestige for the teacher and in making the schools and colleges more deeply representative of, and more closely in touch with, the nation. The universities in particular have a very significant part to play, both in turning the thoughts of undergraduates towards science-teaching as a career, and by a carefully thought-out series of measures as already indicated. Such measures should check the weaknesses of over-specialization, facilitate transfer between one faculty and another, and encourage communication between one discipline and another and that wide outlook and human understanding which are so essential in the man of affairs and which are the monopoly of no one faculty.

This is asking a great deal of the universities. It means abandoning some old ideas and practices and accepting some new responsibilities, certainly for closer co-operation with the schools, possibly also in adult education, to foster a deeper public understanding of the whole system of education and what it is attempting to do. It means looking at university policy not alone, but as part of the educational policy of Britain as a whole and putting fundamentals first and not departmental interest or administrative convenience. It means, as part of that whole policy, a clear understanding of the purpose and function of the university itself, not in isolation but in relation to what the colleges of technology, the technical colleges, the technical schools and the grammar schools themselves are doing to provide the nation with the trained man-power it needs. It may well be that the growing dependence of the universities upon public support will enforce on them, as Dr. Eric Ashby pointed out in his recent broadcast talks on the British universities, much closer attention to the interpretation of their work to the public. Prof. Niblett's book fully endorses Dr. Ashby's argument that, while to foster such a public understanding may be a condition of preserving academic autonomy, universities must also to some extent be in opposition to the superficial currents of society, as well as responsible to its deeper needs. The most important consequence, however, of attempts to re-think the functions of the university in relation to national needs and to re-shape policy in terms of educational policy as a whole could well be to stimulate communication between the specialists; as Dr. Ashby suggested, it might encourage the faculties of medicine, of science and of technology to adopt the long-established tradition of the teaching of arts subjects, and bring their own students face to face with genius, in the presence of which most educational problems evaporate.

# ROMAN ROADS IN SOUTHERN ENGLAND

Roman Roads in Britain

By Ivan D. Margary. Vol. 1: South of the Foss Way—Bristol Channel. Pp. 255+17 plates and 11 maps. (London: Phoenix House, Ltd., 1955.) 42*s*. net.

THE excellent map at the end of Mr. I. D. Margary's book is its full justification, were justification needed. It is, in effect, the road-map of modern England. Even the industrial Midlands melt into it without major distortion. It is the sort of map from which the schoolroom study of the Roman Empire should properly begin, intelligent and purposeful with scarcely anything fortuitous about it. It might be described as the skeletal analysis of our countryside. The more is the wonder that more than half a century has elapsed since any survey was made of it on a commensurate scale. In 1924 the Ordnance Survey produced an up-to-date chart without commentary, and its successor, now in active preparation, will shortly present a revised version on a grander scale which must owe much to Mr. Margary himself. During recent years much has altered, roads have been lost and found, and methods of research have been improved, above all by the arrival of air-photography. Only in one respect are the aeroplane and the car inferior to the transport available to Thomas Codrington in 1903 or William Stukeley in 1776: the back of a horse offered the right sort of mobility and the perfect viewpoint for the actual fieldwork involved. Indeed, the author finds it necessary in his preface to warn motorists of the special dangers inherent in the point-to-point pursuit of Roman roads along the modern highway.

The book is a plain topographical description of the roads as they presented themselves to the explorer in 1954. Controversial points are dealt with conservatively, with no hint of the extravagancies which are prone to cloud this study. Here and there the identifications of place-names might have been argued a little more fully, and the impositions of Bertram of Copenhagen, which are not even yet as completely forgotten as they should be, more specifically countered. But these are incidental matters, not for emphasis. Old problems of interest and some new ones arise at many points. The elaborate road-system in the environs of London is not yet entirely solved; for example, it is of more than pedantic concern to know whether the Watling Street from Kent by-passed the site of the city by way of the old Horseferry at Westminster and Hyde Park to the Edgware Road. It is worth recording that nearly half a century ago the late Sir Alfred Clapham, with this point in mind, secured permission to cut a trench in Hyde Park on the line which such a road should have followed, with entirely negative result. Again, how literally, if at all, does the Foss Way represent an early Roman frontier-line? The author's reading of the evidence at Cirencester is against a primary date for that mysterious Way, and his diagnosis is supported by that of Dr. Kathleen Kenyon at Leicester, where also the Foss appears to be secondary to the lay-out of the Roman town. Yet another complex of outstanding interest occurs at the famous site of the town and potteries at Castor in Northamptonshire. In matters such as these, the new survey will, it is to be hoped, serve as a stimulus to fresh investigation with the spade.

The air-photographs, mostly taken by Dr. J. K. S. St. Joseph for the University of Cambridge, are of superb and even dramatic quality. Less can be said of the ground-photographs, some of which seem to be out of focus. But the book is one which should be on the shelves not merely of the specialist but also of all who have an interest in the shaping of England, and an urge to refresh their history with the open air. R. E. MORTIMER WHEELER

# PETROLOGY IN PERSPECTIVE

## A Historical Survey of Petrology

By Prof. F. Y. Loewinson-Lessing. (Translated from the Russian by Dr. S. I. Tomkeieff.) Pp. x+112. (Edinburgh and London: Oliver and Boyd, Ltd., 1954.) 12*s*. 6*d*. net.

"ROCKS, like everything else, are subject to change and so also are our views on them." This sentence, from the preface, sets the key-note of this admirable and stimulating book by Prof. F. Y. Loewinson-Lessing, who was one of the "grand old men" of petrology referred to by Dr. S. I. Tomkeieff in a graceful tribute to his former professor. Concise in style and richly packed with material that should send many a student back to the original sources, the book traces the development of the subject from Zirkel's application of Sorby's techniques and pioneer microscopic studies of rocks to the conclusions reached by the author and his contemporaries in 1936, when the original Russian edition was published. The pre-microscopic age of petrology is only briefly discussed and is, perhaps, too rapidly dismissed.

The translation was completed in 1939, in time for Loewinson-Lessing to give it his blessing shortly before his death. Although Dr. Tomkeieff has wisely resisted the temptation to bring the book up to date, he has helped his readers by adding some fifty references to the more important books and papers that have since appeared. As it stands the book is a unity; to have extended it would have involved the introduction of new methods and techniques unknown to the author, such as those of isotope geology.

The subject is not primarily discussed in chronological order, but rather under the five main approaches to petrology: geological (modes of occurrence of rocks, petrographical provinces, etc.); petrographical (description and classification); chemical (culminating in geochemistry); experimental (crystallization of melts and mechanics of intrusion); and synthetic (problems of petrogenesis). The various problems, which to-day are being attacked with renewed energy by intensive observation in the field and by isotopic studies in the laboratory, are here seen in their historical perspective, but they remain the same problems, and the young petrologist could have no more inspiring introduction to the development of his subject. It is, indeed, a book that should be read by all geologists. Dr. Tomkeieff and the publishers have done their work well and deserve our thanks; not least, perhaps, for the very moderate price. ARTHUR HOLMES

# CONSUMER EXPENDITURE IN GREAT BRITAIN

## The Measurement of Consumers' Expenditure and Behaviour in the United Kingdom, 1920–1938

Vol. 1. By Richard Stone. (Studies in the National Income and Expenditure of the United Kingdom—1.) Pp. xl+448. 105*s*. net.

## Consumers' Expenditure in the United Kingdom, 1900–1919

By A. R. Prest, assisted by A. A. Adams. (Studies in the National Income and Expenditure of the United Kingdom—3.) Pp. xiii+196. 42*s*. net. A series published under the joint auspices of the National Institute of Economic and Social Research, London, and Department of Applied Economics, University of Cambridge. (Cambridge: At the University Press, 1954.)

THESE two books form part of a series of studies of the national income and expenditure of Great Britain, conceived and carried out under the general direction of Mr. Richard Stone by the National Institute of Economic and Social Research, London, and the Department of Applied Economics of the University of Cambridge. Work on the project was started in 1941 with the main object of "bringing together quantitative information relating to various aspects of the economic development of the United Kingdom, especially between the wars of 1914–18 and 1939–45". In the end it is hoped that all the estimates may be put together in the form of social accounts.

The task of collecting and bringing together the data in these two volumes must have been immense. An enormous variety of primary and secondary sources was consulted, adjustments had to be made to allow for changes in definition over time, and the reliability of the original figures had to be assessed. The sources that are used are everywhere described in detail, as are the methods of estimation employed. As an end result, Mr. Stone is able to present price and quantity series showing the demand for a large number of different foodstuffs, tobacco, rent, rates and water charges, and fuel and light. In the second book, dealing with the period 1900–19, Mr. A. R. Prest must necessarily use less reliable data, but his field of coverage is wider than Mr. Stone's; he deals with expenditure on clothes, travel, books, amusements, life insurance and funerals, and domestic expenditure other than food, in addition to the topics covered by Mr. Stone. The expenditure on those items for 1920–38 will presumably be dealt with in Mr. Stone's forthcoming second volume.

By bringing this information together and arranging for comparability and continuity, the authors have provided an invaluable service, and their final results will be of value to a much wider circle than economists as a starting-point for further investigations. Mr. Stone's book, however, is not a mere storehouse of information. He attempts an analysis of market demand by combining the time-series that he has constructed with the results of investigations of family budgets and proceeds to calculate elasticities of demand for the commodities he deals with. There is a lengthy preface which deals with the aims and methods of econometrics, and the second part of the book contains an exposition of the theory of market demand and of the statistical procedures used in its analysis. This section contains a systematic account of multivariate analysis, based on methods of matrix algebra, which have been increasingly used in recent years.

A word of praise is due to the printers for a very fine job in producing the mass of material with such clarity.

# SOLAR PHYSICS

**The Sun**

Edited by Prof. Gerard P. Kuiper. (The Solar System—Vol. 1.) Pp. xix+745. (Chicago: University of Chicago Press; London: Cambridge University Press, 1953.) 94s. net.

NOTHING comparable with this work has appeared since the publication of Vol. 4 of the "Handbuch der Astrophysik" in 1929. A comparison of the two volumes demonstrates impressively the strides solar physics has made in a quarter of a century. The identification of 'coronium', the recognition of $H^-$ absorption, postulation of the carbon–nitrogen cycle, invention of the coronagraph (and more recently the interference filter), development of the rocket spectrograph and the magnetograph, the discovery of chromospheric flares and their terrestrial effects and of solar radio noise—all these advances, though solving some problems, have raised many others. It is small wonder, then, that adequate cover of a subject dealt with in 1929 by three authors in three hundred and fifty pages now takes twenty-three authors nearly seven hundred and fifty pages.

The expressed design of the editor, Prof. G. P. Kuiper, has been to collect and systematize all significant information on the Sun into a volume that will be at once a reference handbook for the specialist and a survey intelligible to anyone versed in the physical sciences. It is a big task, but he may claim, and be accorded, a fair measure of success. If, as the preface seems to indicate, each author used his own judgment as to what material is of sufficient importance to be included, one must congratulate the editor at least on his choice of contributors. The general level of appeal is extraordinarily uniform in a work with such heterogeneous origins, and if in some chapters the hypothetical reader with no previous astrophysical leanings may be repelled by an austere approach, this will not deter the specialist from turning to the work as a handbook of research.

All men of science deplore a growing tendency towards a restrictive nationalism in scientific books. Astronomy traditionally transcends national boundaries, and it is a pleasure to record in this instance contributions from authors in six different countries, in which no such tendency can be detected. One is especially glad to welcome the dedication: at least one American book in the past has contrived to describe the coronagraph without so much as mentioning the name of Bernard Lyot. It is regrettable that the present volume includes no contribution from the U.S.S.R.; but the cause can doubtless not be laid entirely at the door of the editor, who is as well aware as anyone how much solar research carried out in Soviet territories remains a closed book to Western readers.

The book opens with an introduction which quotes fundamental data and, bringing the general reader to about 1930, directs him to the particular one of the following chapters which is appropriate to his interests. The solar interior, the photosphere, and the chromosphere and corona are each discussed with thoroughness in a chapter contributed by an acknowledged leader in the field. These chapters are primarily concerned with the quiet Sun, in which each of these rather arbitrarily defined regions is in equilibrium with its neighbours. In contrast, Chapter 6 deals with the observable transient disturbances in the solar atmosphere, and with their terrestrial effects. Fascinating though this subject is, one wonders whether its importance justifies making this the longest chapter in the book. The next chapter is devoted to an observational and theoretical discussion of solar radiation at radio wave-lengths. That this is perhaps the most controversial in the book, and the one of which the conclusions are least likely to survive unchanged, is no more than to be expected in a subject barely ten years old. Chapter 8 is entirely theoretical and comprises a critical review of recent work in solar hydromagnetics. This subject is entirely new and bristles with so many difficulties that Prof. T. G. Cowling's survey is most welcome at this stage. The last chapter in the book is a miscellany of short contributions held together by no more than the title: "Empirical Problems and Equipment". This is not to say that it does not contain some of the most interesting pages in the whole book; certainly the illustrations here are magnificent. The book is rounded off with two useful appendixes giving a wealth of data on established solar observatories (optical and radio), their instruments and the type of work they undertake.

The book is impeccably printed on the calendered paper made necessary by including half-tone plates on a lavish scale throughout. The table of contents is admirably full; the alphabetical index, however, less so. Cross-references, necessarily frequent in so heterogeneous a work, are made maddeningly difficult to trace by the omission of chapter and section numbers from the page headings.

This volume is the first of four to be devoted to the solar system. It will give the solar physicist all he can reasonably expect in the way of an advanced text for many years to come. If the standards of the present work can be maintained in the forthcoming volumes of the series, astronomers and geophysicists will be heavily in Prof. Kuiper's debt.

A. HUNTER

# CHARACTERISTICS OF SOME ANIMAL CALLS

By DR. P. MARLER

Jesus College, and Department of Zoology, Madingley Ornithological Field Station, University of Cambridge

## Sounds facilitating Location

IT is well known that some animal vocal sounds enable individuals to establish contact. The songs of various male birds, Orthoptera and Heteroptera[1,2], assist nubile females to find mates. Species which form groups at some stage of their life-history often maintain contact by special calls (for example, the great-tit, *Parus major*[3]).

The accuracy of sound location depends on the capabilities of the auditory receptors of the hearer, the physical characteristics of the sound signal and the distinctiveness of the sound, including the effects of distance from the source and of contrast with environmental noise. The auditory receptors of insects do not respond to pressure changes, like those of mammals and birds, but to variations in displacement. Since this is a vector quantity, they can locate sound sources directly[4], without reference to time, phase or intensity differences, and thus independently of frequency within their audible range (400–28,000 cycles in *Thamnotrizon*[2]).

Mammals, of which man has been most studied[5,6], and birds[7,8], locate sounds by making binaural comparisons of differences in phase, intensity and time of arrival. In contrast with insects, the efficiency of location thus varies with the frequency of the signal. Phase difference is most useful at low frequencies, because the information it provides becomes ambiguous when the wave-length is more than twice the distance between the ears. Also the refractory period of the auditory nerve (about 1 m.sec.) probably limits the perception of phase differences to frequencies less than 1 kc./sec. (that is, one cycle per m.sec.). Intensity differences are most useful at high frequencies, since obstructions in the path of a sound, such as a head, only cast appreciable sound shadows when their dimensions are greater than the wave-length of the signal. Time-difference can be used throughout the auditory range. It is clear that the most readily located signals will be complex ones, which provide clues for all three methods.

The song of the male chaffinch, *Fringilla coelebs* (Fig. 1), is known from field observations and from experiments with recorded songs to attract unmated females to its point of origin, and to repel rival males[9]. It has a wide frequency spectrum, centred on 3 kc./sec., which is within the range of maximum sensitivity of the chaffinch ear[10]. It is rich in sudden changes of frequency, which provide points of reference for binaural time-comparisons. Experiment suggests that intensity differences are actually most significant in location by the chaffinch[11], no doubt because its ears are so close together that time- and phase-differences are difficult to perceive (though for larger birds they are probably important). Emphasis on the use of intensity-differences would tend to encourage high frequencies in song, which are most effectively blocked by the head.

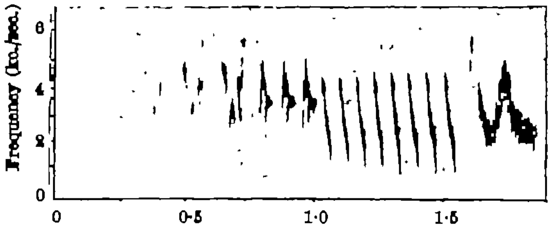

Fig. 1. A sound spectrogram of a song of a male chaffinch. Note the many sudden changes in pitch and the wide frequency range

But to serve its functions, song must be audible at a considerable distance; this sets an upper limit to frequency since, as it increases, the rate of attenuation with distance also rises rapidly. Furthermore, high-frequency sounds are easily reflected even by small objects such as tree branches, making their original source difficult to locate. Another aspect of the function of song is that it is directed to members of the species, and should therefore differ distinctively from the songs of other sympatric species. This is true of the chaffinch in Western Europe, and in the Azores[12]. It is clear from the use of song characteristics in distinguishing closely related species (for example, *Phylloscopus trochilus*, *P. collybita* and *P. sibilatrix*[13]) that this is usually the case. But when the number of co-habiting species is reduced, as on small islands, songs may become much more variable (for example, notes of the blue-tit, *Parus caeruleus*, on Teneriffe[14] and the goldcrest, *Regulus regulus*, in the Azores[12]).

Thus the physical characteristics of chaffinch song are closely adapted to the part it plays in life. The sound signals of the domestic fowl, *Gallus domesticus*, which attract small chicks[15], share the characteristics of segmentation or repetitiveness, brief duration of the component notes, and the presence of relatively low frequencies (less than 800 c./sec.). Much of the energy is concentrated at the start of the notes. Like chaffinch song, these characteristics can be related to the facilitation of sound location, the low frequencies to allow phase-difference to be used, the segmented 'click-like' properties for time-difference.

## Sounds confusing Location

There is a conflict in many animals between the need to appear conspicuous to their own species and inconspicuous to predators or prey, which is manifest in their coloration[16] and also in their vocalizations. Small Passerines have two distinct responses to a hawk or owl[3,9,17]. If the bird of prey is perched, they make themselves conspicuous by 'mobbing' behaviour, which attracts other birds' attention to the predator; if it is in flight, they dash for cover, and hide. Chaffinches use quite different calls in each case. In the first they give a 'chink' note (Fig. 2), which provides abundant location clues; in the second, males give a high, thin 'seeet' note. The former is easily located by man, the latter only with difficulty, and the same is probably true for predators.

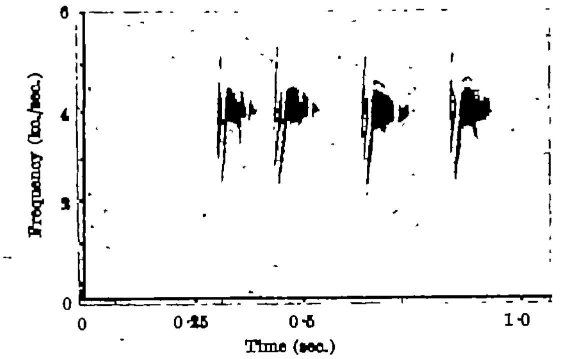

Fig. 2. Four 'chink' calls of a female chaffinch. This call shares with song the characteristics of discontinuity and wide frequency-range

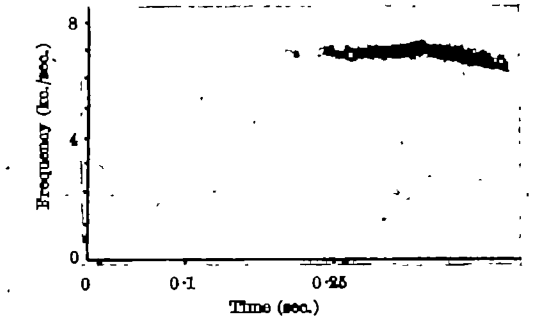

Fig. 3. A 'seeet' call of a male chaffinch, evoked by a sparrow hawk. Note the constant pitch and the absence of any sharp discontinuities

Pure tones in the region of 2–5 kc./sec. are difficult for man to locate because they are too high for binaural comparisons of phase-difference, and too low for there to be appreciable intensity differences, so that only time-differences can be used[8]. In birds of prey such as owls and hawks, the lower limit of this range of frequencies, which are difficult to locate, is probably similar to that of man (perhaps set by the refractory period of the auditory nerve around 1 kc./sec.). The upper limit must be considerably higher, since sound shadows only become appreciable when the wavelength approximates to the diameter of the obstruction. Thus the 'seeet' call of the male chaffinch probably gives no clues to its location by phase- or intensity-difference. It also begins and ends imperceptibly (Fig. 3), and thus gives no clues for comparison of binaural time-differences. Finally, its wavelength (about 5 cm.) is small enough to result in free reflexion from the trunks of small trees. Thus the 'seeet' call seems to be adjusted to avoid giving location clues of any kind to predators. Yet it serves to communicate the presence of danger to other chaffinches, which fly to the nearest cover irrespective of the location of the calling bird. Imitations which have similar characteristics evoke an identical response[9].

It is interesting to find that other unrelated Passerines such as the blackbird, *Turdus merula*, missel thrush, *T. viscivorus*, and various titmice[9] and buntings (Andrew, unpublished work) have 'hawk' calls with similar characteristics (see Fig. 4), no doubt for the same reasons. Many juvenile Passerines, which are very susceptible to predation, have calls which are difficult for man to locate (for example, the wren, *Troglodytes troglodytes*[13]) and which resemble the 'hawk' calls in structure and frequency (Fig. 5). It is possible that certain species such as the hawfinch, *Coccothraustes coccothraustes* (Fig. 6), have even adapted their contact calls to give few location clues to predators, as may be true of some small rodents and insectivores. The song of the grasshopper warbler, *Locustella naevia*, is perhaps ventriloquial for the same reason.

The warning signals of the domestic fowl differ as a group from those which attract chicks, and are in many ways their opposites[15]. They are of relatively long duration, show little segmentation or repetitiveness, and lack very low frequencies. Although never as high-pitched as the 'hawk' calls of small Passerines (400–2,700 c./sec.), they appear otherwise to be very similar, in the absence of clues by which predators might locate their source by time-difference, perhaps by phase- and intensity-differences as well.

Vertebrate predation must be an equal problem for insects which communicate by sounds. Analysis reveals that most Orthopteran songs have their main

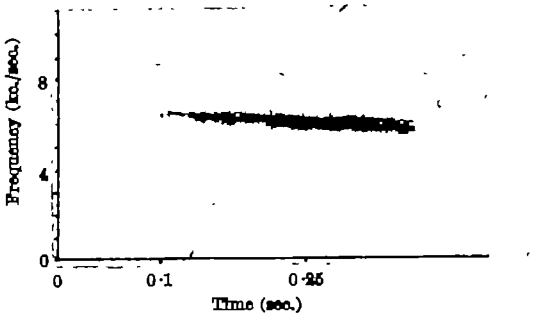

Fig. 4. A 'hawk' call of a male blackbird, scarcely distinguishable from that of a chaffinch

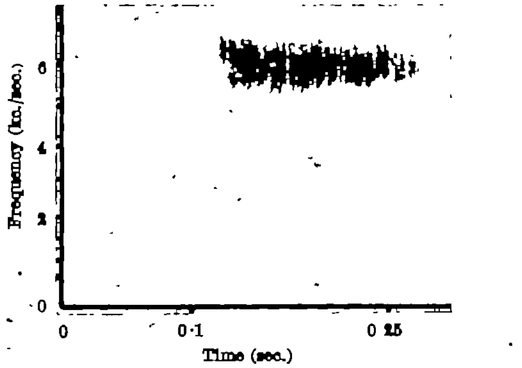

Fig. 5. The 'food-begging' call of a young wren. This shows many of the characteristics of the 'hawk' calls

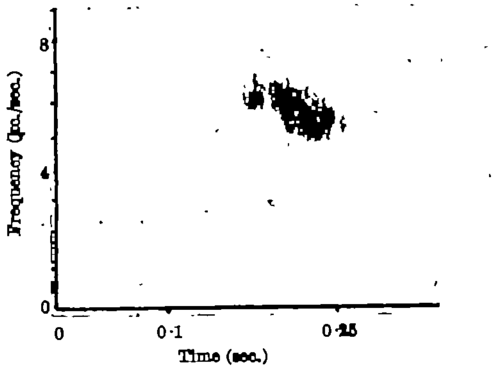

Fig. 6. A 'seep' call of a female hawfinch, used for maintaining social contact in winter

energy in the region of 6–14 kc./sec.[19]. Signals of this frequency may well be as difficult for their bird predators (Laniidae, Tetraomidae, etc.[20]) to locate as for man. Also they are well above the range of maximum sensitivity of most birds, as so far investigated[21]; and will be freely reflected by even small obstructions. Exceptions are the songs of various Grylloidae (2–4 kc./sec.)[19,22], which, in contrast with other Orthoptera, are largely crepuscular or nocturnal and, with their cryptic and often subterranean habits, may be less exposed to predation.

Another method of confusing predators may be to sing in communal groups, thus making it difficult for any one individual to be located. Pringle (unpublished work) has suggested this explanation for the habit among Cicadas (Heteroptera), and it might also be applied to the communal singing of frogs.

Thus it appears that many of the sounds used in bird and insect 'language' have not been chosen arbitrarily, but are directly adapted in structure to the function they have to perform.

I am indebted to Prof. J. B. S. Haldane and Dr. W. H. Thorpe for criticism of this article.

# WILLIAM HIGGINS, CHEMIST (1763–1825)

By PROF. J. R. PARTINGTON, M.B.E.

ALTHOUGH William Higgins was, in his time, one of the distinguished group of Irish chemists which included Kirwan, singularly little is known of many aspects of his life, and some inaccurate statements about him and his work have been repeated by the few who have written about him. Prof. T. S. Wheeler, of Dublin, who has for some years been engaged in a study of Higgins, has recently published two articles[1] based on primary sources, including some which were unknown to previous writers, and these articles throw new light on several aspects of the life and work of Higgins.

William Higgins was born at Collooney, Co. Sligo, probably in 1763, and died in June 1825. He was the nephew of Bryan Higgins, also known as a chemist. He was from 1787 until August 1788 at Pembroke College, Oxford, previously matriculating at Magdalen Hall in 1786. He is said to have been "operator" (lecture assistant) to Beddoes, the reader, who succeeded Austin, the professor of chemistry, early in 1788. On leaving Oxford he went to London. Since he says himself that he assisted his uncle in numerous experiments which Bryan Higgins published in a book in 1786, he must have been in London before he went to Oxford. The reason why he left Oxford after so short a stay and without a degree is not clear; but since he published his book criticizing the phlogiston theory in 1789 he must have been working on it in Oxford, and since Bryan Higgins was a supporter of the phlogiston theory and made some original contributions to its later aspects, he may have withdrawn his support of his nephew. This, however, is only a conjecture.

In January 1792 Higgins was appointed chemist at Apothecary's Hall, Dublin. Hitherto, little has been known of this period of Higgins's career, and Prof. Wheeler is the first to have had access to the relevant minute books. Higgins received a salary of £200 a year, with apartments, coals and candles, taking over a "small back room" in May. He fitted out a laboratory. His salary came into arrears, and in 1795 Higgins asked for payment in such terms that his employment was terminated, the governors borrowing £200 to pay him off. In 1795 he was appointed part-time "Chymist" to the Irish Linen Board, at a salary of £100 a year, which appointment he held until 1822. He did a considerable amount of good work for the Board, publishing in 1799 an "Essay on Bleaching". His merits were appreciated by Kirwan, a phlogistonist whose theories Higgins had attacked in his book, and it was on Kirwan's recommendation that Higgins was appointed in 1795 to supervise the Leskean Collection of minerals of the Royal Dublin Society, becoming professor of chemistry and mineralogy by an Act of the Irish Parliament passed in 1796. He began to lecture in 1797. He had been elected to the Royal Irish Academy in 1794 and was elected F.R.S. in 1806 (his nomination certificate being signed by Davy), but first signed the charter book and obtained admittance in May 1817.

Although he lived in rooms in Dublin, Higgins left a considerable amount of property on his death, having purchased lands for £2,000 and £6,800 during 1818–23. He had a reputation for eccentricity, and many anecdotes of him were current. Davy, in his obituary notice, complained that Higgins did little in the later years of his life, but he seems to have been kept busy in his various appointments.

Higgins is best known for his book, "A Comparative View of the Phlogistic and Antiphlogistic Theories", published in 1789 and again in 1791. In this he argues against the phlogiston theory, which Kirwan had supported in an "Essay on Phlogiston" in 1787. An example of his style is provided by the following extract from the "Comparative View": "Although I do not think sulphur contains phlogiston, or the solid matter of light inflammable air, I by no means suppose it to be a simple body, but to be relatively to our knowledge of chemistry, as simple as the earths or the two fixed alkalies, all of which I make no doubt will be analysed at some future period, when the science of chemistry will be more cultivated than at present, by men of genius, fortune, and leisure" (p. 120). The book contains some new discoveries, such as the solution of iron in sulphurous acid without the evolution of hydrogen, and an appendix on an analysis of a human calculus which was presented to the Royal Society but was not printed. It also describes some ingenious quantitative experiments, for example, on the composition of nitric acid and of hydrogen sulphide (which, however, he regarded as a mere solution of sulphur in hydrogen, not a compound). These experiments were made in Oxford and possibly in his uncle's well-known laboratory in Greek Street, Soho, in London.

Higgins deals with chemical combination on the basis of the union of 'ultimate particles' of elements, and he clearly recognized, probably for the first time, that a particle of one element may unite with more than one particle of another, in the oxides of nitrogen up to five particles of oxygen combining with one of nitrogen. In this the law of multiple proportions is implicit. Applications of the atomic theory to chemistry had been made before, notably by Bryan Higgins, who explained the union of one particle of each of two elements to form a molecule (a name used by him) of a compound, calling the process 'saturation', a name also used by William Higgins. Bryan Higgins used the idea of central forces, while William used a different idea, more akin to modern views on valency. Bryan Higgins hints only obscurely that perhaps two particles of an element may saturate one of another.

In his "Comparative View", William Higgins paid little attention to the weights of the particles, and only once in the book does he hint that they may have different weights, without attempting to determine them. He does not seem to have realized the novelty of his conceptions.

Some have said that Higgins thought that the particles of different elements were equal in weight, but Prof. Wheeler concludes that this is unlikely. It is more probable that he assumed nitrogen, oxygen and sulphur equal (14, 16, 32/2) and that he knew that the particle of hydrogen was much lighter. He seems to have thought that the matter of all particles has the same density, and that the weights of the particles are proportional to the sizes of the hard nuclei, apart from the atmospheres of fire (caloric). He thus supposed that the particles in different gases are at different distances from one another, so that he could not draw conclusions from the densities, as Avogadro afterwards did. He did, however, consider that the numbers of particles in equal volumes of gases under the same conditions of temperature and pressures were in simple numerical ratios. He arrived at reasonable views on the composition of several molecules, such as that of water (HO) and the oxides of sulphur (SO and $SO_2$) and nitrogen (NO, $NO_2$, $NO_3$, $NO_4$ and $NO_5$). He used symbols for the particles of different elements—nitrogen P, sulphur S, oxygen D or *d*, hydrogen I, etc.—and he also made an approach to the idea of valency bonds, drawing lines between the symbols of the elements and assigning arbitrary numbers to the forces between the particles. He supposed that the force of a central particle was progressively weakened as more and more particles of another element were attached to it, the bond strength being the sum of the force of an attached atom and the force of the central particle divided by the number of particles attached to it. This idea enabled him to discuss in a very ingenious way what would now be called transition complexes. In these associations of particles, the forces are weakened when another body is brought up, and the effect of this is transmitted through the complex, leading to rearrangement and reaction. In such cases he used the idea of a preliminary orientation of particles, which had also been used by Bryan Higgins. These views are more ingenious than those of Dalton, who followed Newton in using central forces, which enabled him to explain the properties of mixed gases, a problem not considered by Higgins.

Some years after Dalton published his atomic theory, Higgins in 1814 wrote "Experiments and Observations on the Atomic Theory", in which he reproduced parts of the "Comparative View" with the intention of showing that he had anticipated Dalton. In many cases, however, he reads into these more than he said in 1789 and alters some of his conclusions. He suggests that Dalton had known of, and used, his earlier book in formulating his theory; but no evidence of this has ever been produced[2]. Prof. Wheeler believes that Dalton was unaware of the work of Higgins. Higgins and Dalton both used atomic theories in explaining chemical changes. Higgins was the first to point out clearly the combination of atoms in multiple proportions, and he used the idea of forces linking atoms in explaining reactions, adumbrating the idea of a transition state, but he paid little or no attention to the weights of atoms. Dalton's contribution was the idea of finding the relative weights of atoms and so explaining the quantitative laws of chemical combination, but he paid little attention to attractive forces exerted between the atoms. Dalton's theory includes the law of multiple proportions and, what is important, the law of reciprocal proportions, which Higgins, with his neglect of atomic weight, did not see was a consequence of the atomic theory. The atomic theories of Higgins and Dalton differ in important respects, and it is pointless and probably incorrect to say that Higgins anticipated Dalton. It was Dalton's theory which was developed in the nineteenth century, and many of his ideas appear in the modern atomic theory. Higgins was mainly concerned in refuting the phlogiston theory, and since this was no longer of interest to later chemists his atomic theory, which formed part of his argument, was not properly appreciated. He did not develop it himself and seems to have realized that he could have done so only after Dalton's theory was published.

# SEMICONDUCTORS AND TRANSISTORS: SOME CURRENT PROBLEMS

By Dr. J. R. TILLMAN

Post Office Engineering Research Station, Dollis Hill, London, N.W.2

WHEN Bardeen and Brattain announced their discovery of transistor action in 1948, it was foreseen that much research and development would be needed before widespread applications became possible. What has followed, however, has been on a scale many times greater than generally expected. The more fundamental research has been fruitful, as witness the reports of the international conferences on semiconductors held at Reading (1950) and Amsterdam (1954). It has predicted new effects and new applications and has led to new designs of transistor. Advances in technology have also been striking, though some secondary effects, not yet well understood, introduce unwanted features in transistors.

## Transistor Materials

Germanium and silicon remain the only important transistor materials. Most of their properties as semiconductors—for example, the dependence of resistivity and Hall coefficient on impurity content (usually of a trivalent or pentavalent element) and on temperature, and the wave-length limit of the optical absorption (and the related energy gap)—have been investigated in detail. Interpretations of some of the electrical properties in terms of fundamental quantities demand that the effective mass, $m^*$, of the charge carriers be dependent on the direction of motion relative to the crystal lattice, and differ, sometimes by a factor of more than ten, from the rest mass, $m_0$, of a free electron. Attempts have recently been made to measure $m^*$ by a more direct method; the angular frequency, ω, of an electric field $E$ at which a specimen of a semiconductor exhibits a cyclotron resonance (a peak in its absorption spectrum), when a steady magnetic field $H$ is applied at right angles to $E$, is simply $qH/m^*c$. The conditions necessary to achieve unambiguous answers from the cyclotron resonance measurements are stringent, requiring that the carriers have a mean free time of at least a few cycles of the alternating electric field—a condition met only by the combination of low temperature (for example, 4° K.), at which collisions with phonons are greatly reduced, and high values of $\omega/2\pi$ (for example, $10^{10}$–$10^{11}$ c./s.). The much reduced thermal ionization of the impurity centres at the low temperature provides too low a density of charge carriers, which must be supplemented by, for example, photo-injection. The values of $m^*/m_0$ obtained confirm a dependence on the orientation of the crystal under test with respect to the direction of $H$ and differ for holes and electrons. Theoretical computations of the energy band structure for germanium and silicon have been extended to sufficient points in momentum space to account, at least qualitatively, for the cyclotron resonance results.

The effects which limit the life-times of minority carriers (such as those injected by the emitter of a transistor into the base region or produced by photons of sufficient energy) are only partially understood and not well controlled. Thus nickel and copper present large cross-sections for the capture and recombination of holes in $n$-type germanium; parts in $10^{11}$ of nickel (parts in $10^{10}$ of copper) could account for most of the recombination occurring in much of the $n$-type monocrystalline germanium prepared to-day. The same two elements also have large capture cross-sections in $p$-type germanium, where they act as recombination centres for electrons. The segregation constants of both elements, in germanium, are very small, making zone-refining apparently efficient, but they are not accurately known, partly because both elements diffuse comparatively rapidly into solid germanium at elevated temperatures; both exhibit retrograde solid solubility in germanium. Control of life-time by the addition of either element to molten germanium from which single crystals are afterwards drawn is therefore difficult. There are, however, applications which call only for a minimum value of life-time, involving no addition of a material of high recombination cross-section. Physical imperfections, particularly the dangling bond associated with the edge component of dislocation lines in the otherwise near-perfect germanium, can also act as recombination centres; their numbers must be controlled, both for this and other reasons.

## Transistor Technology and Physics

The properties of the surfaces of semiconductors are insufficiently understood. No simple complete model exists for the rectifier formed at the contact between a sharp metal point and a piece of germanium or silicon—and in general none for a formed point contact, that is, one at which sufficient electrical energy has been rapidly dissipated to produce local melting, followed by rapid cooling. Experimental studies have been made; but the interpretation of some depends on details not well under control—for example, the structure and composition of surface layers.

Changes in the contact potential of a surface when exposed to a sequence of atmospheres have been studied. Layers of $p$-type conductivity form on $n$-type material exposed to an oxidizing atmosphere and of $n$-type conductivity on $p$-type germanium exposed to water vapour; water vapour may, however, counteract the short-term effect of an oxidizing atmosphere on the growth of layers. The effective area of the layer (more usually called a channel) adjacent to a $p$–$n$ junction increases with reverse bias across the junction, but the breakdown voltage of the junction between the channel and the underlying material may be much less than that of the main junction.

The rate of recombination of minority carriers can be very high at surfaces, and, in a transistor formed by alloying two small pellets of indium opposite one another on a thin wafer of germanium, can predominate over that in the bulk material, unless the surface material damaged in preparing the wafer is completely removed before alloying, and the final etching, washing and drying carefully attended to. At the moment, surface effects may be the most important of those responsible for the failure of some transistors to have, and retain, the properties predicted.

The alloying process, though widely used, has uncertainties. The indium melts and dissolves germanium until the solution is saturated. The first part to solidify on cooling takes the structure of the underlying undisturbed germanium and may be strongly $p$-type (because indium is trivalent) if the alloying temperature is high enough. The continuity of the germanium across the $p$–$n$ junction may have regions of imperfection, however. None the less, alloy diodes, carefully processed and sealed in a dry inert gas, can have voltage/current relationships little different from those calculated, indicating that any imperfections can be apparently unimportant initially; they may still play some subsequent part in changes of performance, however.

The reliability of transistors will probably ultimately reside in the vital regions of the surface and bulk near the junctions or contacts. High electric fields (for example, $3 \times 10^4$ V./cm.) exist at the collector junction or contact, where the working temperature may, due to the power dissipation, be 70° C. or more in germanium and 150° C. in silicon units. The drift of metal ions and the diffusion of atoms across the boundary, into the base region, particularly in regions of local imperfection, may well set one limit to the life of units. The high field extends to the periphery, where it may cause dielectric breakdown in any protective film, and may lead to shunting of the junction by ionic conduction and to erosion of the germanium at the edges of the junction.

A wide variety of changes of performance can be noted when units are exposed to wet and dry atmospheres, ozone, halides and the vapours of some organic liquids; the effects of high humidity are particularly detrimental when small quantities (for example, $1/10^6$) of salts of nickel or copper are present in the final washing water. Because these metals are often used as connecting stubs or leads, great care needs to be taken in manufacture to prevent their transfer to unwanted places.

Some new designs of transistor have involved new techniques and therefore require new studies of basic phenomena. The surface barrier transistor, made by electrolytically etching two wells opposite one another in a wafer and afterwards electrolytically depositing or evaporating emitter and collector electrodes in the wells, depends for its action on the contact between the metal coating and the semiconductor as left by the electrolytic etch. Platinum, indium, copper, lead and antimony are among the metals used. As with point-contact rectifiers, the work function of the metal seems to have little influence on the overall performance. No satisfactory theory has yet been given to account for the high hole content of the current flow across such metal–semiconductor contacts.

The solar and atomic batteries are recent additions to the possible uses of silicon *p–n* junctions; each converts some of the energy of a radiation, solar or $\beta$, respectively, via the production of hole-electron pairs in the vicinity of the junction, into electrical power. Problems of damage to the lattice, with degradation of performance of the battery, may be severe in the atomic unit.

### New Semiconductors

Germanium and silicon are not ideal materials for crystal valves for several reasons. Germanium is a comparatively rare element; valves made from it lose much of their performance when operated at ambient temperatures above about 70° C. Silicon presents difficulties of purification; its technology involves accurate control of temperatures around 1,420° C. The mobilities ($\mu$) of carriers in germanium and silicon ($\sim$ 400–4,000 cm.$^2$/sec. V.) limit the speed of response of transistors. Searches continue to be made for other transistor materials less severely limited in the above ways. The compounds of elements of Group III with elements of Group V, for example, indium antimonide and gallium arsenide, were among the first to receive attention. The properties of the constituent elements disappear in the compounds, which have a diamond-like structure and the electrical properties of semiconductors. Values of $\mu$ as high as 75,000 cm.$^2$/sec. V. have been reported for electrons in indium antimonide, but the accompanying energy gap is less than 0·3 eV., and the life-time, $\tau$, of minority carriers may be severely limited (perhaps to $< 1$ μsec.). The small energy gap prohibits useful transistor action at room temperature; for a base region of indium antimonide to be extrinsic it must contain about $10^{17}$ impurity atoms per cm.$^3$ and may be nearly degenerate. Collector barriers would be very thin and unable to withstand any usable reverse voltage. Reverse currents at *pn* junctions will be large because of the small gap, large $\mu$ and small $\tau$. Some other compounds have more appropriate values of energy gap, but only moderate values of $\mu$. The search has extended to other binary compounds (elements in Groups IV and VI and also V and VI) and to ternary compounds—for example, $CuInSe_2$—the structure of which also resembles that of diamond. Some, though not suitable for transistors, have extended the range of other electrical properties. Thus the Peltier effect at the junction between bismuth and bismuth telluride has been made to produce a temperature difference of 26° C., and that between *n*- and *p*-type bismuth telluride a difference of $\sim$ 40° C. Some attention has been paid recently to quaternary compounds having the stannite structure, also akin to diamond.

### Problems in applying Crystal Valves

It is now possible to assess more adequately the likely uses of crystal valves. Diodes offer advantages of size, lack of a heater, small capacitance and, sometimes, rapid response. Triodes offer advantages of size, lack of a heater and some additional facilities compared with thermionic valves. The diodes bring few new problems; their noise factors are not well understood, but at radio frequencies are usually tolerable. Minority-carrier storage can set a limit to their speed of operation as switches, for example, in computer circuits; forward current results in an excess of minority carriers near the junction or contact, which prevents the diodes instantaneously becoming of high impedance when a reverse voltage is applied. Recovery times can vary from about 0·01 μsec. to 10 μsec. Triodes set many more, and sometimes severe, problems. The noise factor can be intolerable at audio-frequencies for some uses; here the dominating component at a frequency $f$ is often proportional to $f^{-n}$, where $n$ is about 0·9–1·2. The equivalent circuits are more involved than those of thermionic valves, and it is not always easy to relate the components of the equivalent circuit which suits the engineer to those preferred by the device designer. Methods of circuit analysis and design both for large-signal and small-signal applications are being evolved, but the limitations of upper working temperature (less stringent for silicon units), of power handling capacity and of frequency response continue to restrict the field of applications.

---

# OBITUARIES

## Prof. Albert Michel-Lévy

Albert Michel-Lévy was born at Autun on July 3, 1877. His father, Auguste (1844–1911), was a very distinguished geologist and mineralogist, best known for his fundamental work on the relationship of chemical composition to optical properties in the feldspar group, which is still used as the basis for the identification of members of this most important group of rock-forming minerals. Albert at first studied agriculture and forestry at Nancy; but he soon found an opportunity to turn to geology, and in 1901 he entered the Collège de France as a student of Ferdinand Fouqué's. His early work was on the rocks of the central massif of France in Morvan and Le Loire, and his thesis for his doctorate embodied the results of many years work in that region. In 1913 he succeeded to Louis Gentil as a lecturer in petrography at the Sorbonne. Here he carried out many investigations of volcanic rocks and of mylonites, illustrating his papers on these rocks by photomicrographs of remarkable excellence. He was ever ready to lend his special skill with the polarizing microscope to workers in fields other than petrography, and this led, happily, to some work on the birefringence of nitrated cellulose and in turn to work on other explosives. Together with Henri Muraour he studied, and photographed under the microscope, the behaviour of single crystals of explosive substances, observing the products of the explosion, the light flash, and the shock waves. Later they extended their observations to the modifications in the shock waves when explosion took place in one of the heavier gases like argon, comparing these with the effects seen in atmospheres of lighter gases.

This work on explosives suggested to Michel-Lévy a way of synthesizing rock-forming minerals under pressure and in presence of water vapour. The materials for the synthesis were enclosed in a 'bomb' cleverly designed to accommodate also a small explosive charge. The 'bomb' could be heated in an electric furnace at first to a temperature of 200°, at which the explosive detonated, producing the high pressures required in the closed 'bomb'. This was then heated to higher temperatures and could be kept there for days or weeks as desired. The identification of the minerals synthesized in these experiments was made by means of X-rays by Jean Wyart, and in later experiments they had the collaboration of one of Michel-Lévy's daughters, now Mme. Mireille Christophe-Michel-Lévy, by whom the work is still being carried on.

Twice Michel-Lévy's scientific work was interrupted by wars. He came of a family devoted to the service of France. His grandfather had served in the Crimea as a surgeon and became a very distinguished officer in the French Army medical service. In the First World War Albert Michel-Lévy, *Capitaine de chasseurs à pied* and later *Chef de Bataillon*, was twice grievously wounded, and he ended the war as an officer on the General Staff. He was made a chevalier of the Légion d'Honneur, of which he became an officer in 1920, and commander in 1946. In the Second World War, after the fall of France, he was removed from his post at the Sorbonne because of his Jewish ancestry. Protests at his removal were eventually successful in having the interdiction withdrawn in January 1942, and he was able to resume his work, though not in his own laboratory. However, worse was in store. His only son, Roger, fighting in the resistance, was taken prisoner and shot in February 1944. The loss was irreparable. Michel-Lévy's health was never again very good and he retired from his professorship in 1946, though he continued work with Jean Wyart and his daughter until 1948. He died in Paris on May 2, 1955. He was made a professor of the Sorbonne in 1936, and was elected a member of the Academy of France on January 22, 1945.

W. CAMPBELL SMITH

## Prof. Madison Bentley

PROF. MADISON BENTLEY died in California, U.S.A., on May 30. He was born at Clinton, Iowa, on June 18, 1870. His early training was at the University of Nebraska. He then went to Cornell University where, in 1898, he obtained the Ph.D. degree. At Cornell he remained, first as instructor and then as associate professor of psychology, until 1912. During 1912–28 he was professor of psychology and director of the Psychological Laboratory at the University of Illinois. In 1928 he succeeded Titchener at Cornell as Sage professor of psychology, and there he remained until his retirement from official life. He became president of the American Psychological Association in 1925, he was a Fellow of the American Association for the Advancement of Science, chairman of the Division of Anthropology and Psychology in the National Research Council; and he was editor of the *Psychological Index* (1915–24), of the *Journal of Experimental Psychology* (1926–30) and co-editor for many years of the *American Journal of Psychology*.

Madison Bentley achieved a position of great influence in the relatively early days of experimental psychology in America. He was of a modest and friendly disposition, a man of complete intellectual honesty, yet willing to try to see something good in all the many systematic, and often highly dogmatic, approaches to psychology which characterized the end of the nineteenth and the beginning of the twentieth centuries. This temper of mind made him an admirable editor, and his successful editorial work, as he himself recorded, broadened his knowledge and increased his tolerance. He wrote widely but mostly in journals, or in books of the familiar American 'portmanteau' kind. There were two volumes of his own: "The Field of Psychology", published in 1924, and "The New Field of Psychology", which appeared about ten years later. In the second, Bentley showed himself rather surprisingly sympathetic to practical and applied developments of experimental psychology.

When Prof. Carl Murchison got the excellent idea of producing a series of volumes to be called "History of Psychology in Autobiography", Madison Bentley was naturally one of the people approached for an early contribution. He wrote a beautifully unassuming account of his intellectual development (Vol. 3, p. 53; 1936). He acknowledges his debt to Titchener, and it is characteristic that he should select one item of this debt as most important. He had "submitted a cherished manuscript" for criticism and got it back with these remarks: "Here it is. I don't think that I have ever told you that I thoroughly disliked anything that you had written. I do this. It is decidedly bad. Cut out your figures and have done with your fine writing". This, says Bentley, "was a major operation without anæsthetic. Recovery was slow, but it left my organism saner".

Whether or no this was the reason, it was the sanity and dependability of his judgment, as well as the wide range of his knowledge, that won for Bentley the deep respect and admiration of psychologists everywhere.

F. C. BARTLETT

## Mr. G. W. Lines, C.B.E.

GEORGE WILLIAM LINES, director of agriculture, Sierra Leone, will be well remembered in West Africa and especially in agricultural circles of Nigeria and Sierra Leone, where he had a long and distinguished career. He died at his headquarters at Njala on February 11 in his fifty-second year.

After graduating from St. Catherine's College, Cambridge, in 1924, he obtained a Cambridge diploma in agricultural science before he joined the Colonial Agricultural Service in 1925. He spent the earlier part of his service in Nigeria, where he was noted for the enthusiasm and energy he put into his work and for his genial personality. He was particularly successful in obtaining the co-operation and confidence of the native farmers to a degree seldom attained by other officers in the Service.

Lines took a leading part in establishing the co-operative preparation and marketing of cocoa in the Western Region, and later he initiated the planting of improved oil palms to replace the wild palms on which the farmers relied. In Nigeria perhaps he will be best remembered in the Bida area where, during the War, he established a thriving local fibre industry which proved of lasting benefit to the farmers and met an urgent demand for materials previously imported and then practically unobtainable.

On his transfer to Sierra Leone in 1944, he gave outstanding service in the organization of supplies and later assisted in the improvement of production and quality of piassava, a product for which Sierra Leone is famous. He was promoted to principal agricultural officer in 1945, deputy director of agriculture in 1949 and to director in 1951. It was in this latter post that he achieved his most outstanding success. Realizing the impossibility of increasing food production on the overworked and eroded uplands, he went boldly forward to apply mechanization to the cultivation of swamp rice on the vast areas of coastal and inland riverain swamps. The initial experiments met with immediate success, from which he evolved a policy which has led to the provision of a service with mechanized units over large areas of the country. In 1942 he was made an M.B.E. and advanced to C.B.E. in 1955.

By the death of G. W. Lines the Colonial Agricultural Service has lost an outstanding figure, and he leaves behind him many friends, Europeans and Africans alike. His enthusiasm was unbounding and infectious, his initiative exceptional and he gave unstinted encouragement to his staff from the most junior upwards. T. N. GREEVES

---

# NEWS and VIEWS

## Imperial College of Science and Technology, London

THREE new chairs have recently been created at the Imperial College of Science and Technology, London, and the appointments to them are as follows: aeronautical structures, Dr. J. H. Argyris; applied science in the Mechanical Engineering Department, Prof. D. G. Christopherson; and light electrical engineering, Prof. A. Porter.

## Prof. J. H. Argyris

UNTIL the appointment of Dr. J. H. Argyris to the new chair of aeronautical structures at Imperial College, all professors of aeronautics in British universities were primarily associated with aerodynamics. This has inevitably biased students of aeronautics in favour of aerodynamics and has had the result that too few graduates with a primary interest in structures have entered the aeronautical engineering profession. The formation of the present chair will help to change this somewhat unsatisfactory state of affairs. Prof. Argyris studied at Munich and Zurich. He spent some years on the technical staff of the Royal Aeronautical Society, during which period he wrote papers on tapered tubes (representing aeroplane wings), diffusion of loads and panel instability, and wrote an important contribution to the "Handbook of Aeronautics". In 1949 he joined the staff of Imperial College, and in the following year was appointed reader in aeronautical structures by the University of London. Since then, an aircraft structures laboratory, including equipment for the study of fatigue, has been built up at the College. Prof. Argyris's work and published papers since 1949 have been on energy theorems, approximate stress analysis, matrix formulation of structural analysis, instability of panels, experiments on open tubes, and fatigue investigations on bonded light alloys. He is working at present on the statics and dynamics of complex aeronautical systems with particular reference to the use of digital computers.

## Prof. D. G. Christopherson

PROF. D. G. CHRISTOPHERSON was educated at Sherborne School and at University College, Oxford, graduating in engineering science in 1937. After a year at Harvard University as a Henry Fellow, he became research assistant to Sir Richard Southwell and took his D.Phil. in 1940. During the Second World War he worked for the Research and Experiments Department of the Ministry of Home Security on the subject of airborne blast, underwater shock waves and other effects of explosions, and also on the design of structures to resist these effects. In the latter part of the War his work was not so much concerned with defence as with the selection of weapons for attack on specific objectives. After the War he became a lecturer in engineering in the University of Cambridge and a Fellow, later bursar, of Magdalene College. In 1949 he was appointed to the chair of mechanical engineering in the University of Leeds. Prof. Christopherson's research and publications have been mainly on three lines: lubrication, dynamic stress analysis and plasticity. The chair of applied science at Imperial College has been created as part of the expansion plans of the College. The new professor will be particularly concerned with the methods of teaching engineering students of all kinds during their first year at the College, as well as with his own research and postgraduate work.

## Prof. A. Porter

PROF. ARTHUR PORTER is a graduate of the University of Manchester, where he became an assistant lecturer in physics. Before the Second World War he was a Commonwealth Fellow in physics and electrical engineering at the Massachusetts Institute of Technology, and during the War was engaged on special work for the Admiralty and Ministry of Supply. In 1946 he went to the National Physical Laboratory, Teddington, in charge of the Automatic Control Systems Laboratory in the Metrology Division, but soon moved on to become professor and head of the Department of Instrument Technology at the Military College of Science, Shrivenham. Since 1949 he has been in Canada as head of the Research Division at Ferranti Electric, Ltd., Toronto. Prof. Porter has published many papers in the fields of control systems, differential analysers and similar subjects, and is author of a monograph on servo-mechanisms. At the Imperial College he will work in close association with Prof. A. Tustin, the new head of the Department of Electrical Engineering (see *Nature*, January 22, p. 148).

### Physics at the University College of Rhodesia and Nyasaland : Dr. E. Leighton Yates

Dr. E. Leighton Yates, senior lecturer in physics in the University of Sheffield, has been appointed to the chair of physics in the University College of Rhodesia and Nyasaland, Salisbury, Southern Rhodesia. Educated at the Grove Park Grammar School, Wrexham, he then studied under Prof. E. A. Owen at the University College of North Wales, Bangor, and graduated with first-class honours in physics. He did postgraduate work with Prof. Owen on X-rays, developing a high-temperature camera and investigating pure iron–nickel alloy systems. Proceeding to St. John's College, Cambridge, with a senior research award of the Department of Scientific and Industrial Research, he worked in the Cavendish Laboratory on the separation of the isotopes of lithium, boron and carbon. Dr. Yates is an excellent teacher, having lectured and demonstrated for many years and at all levels to general- and to special-degree students. During the Second World War he was largely responsible for conducting a two-year course at Sheffield in radiophysics and for developing a comprehensive practical course in radio. He has initiated extra-mural and postgraduate courses in electronics, metal physics and modern physics and given courses in building acoustics. Alone and with his co-workers, he has worked on the development of electronic control devices, the X-ray examination of metals and alloys, order–disorder transformation in $FeNi_3$, the growth of single crystals of iron, their magnetic properties under strain, and the design of an X-ray diffractometer for examining strained crystals, using a fine-focus X-ray tube. Dr. Yates's wide knowledge and experience have been always freely available to his colleagues. In the Student Christian Movement, his services have been greatly prized both in the universities and in schools.

### Kossuth Prizes for Research in Hungary

The Hungarian Government has awarded a number of Kossuth Prizes for research, as follows. First-class Prizes, of £1,500 each : Academician László Rédei, for work in the field of algebra and theory of numbers, and particularly for his treatise on the Pell type of equations ; and Academician Gyoző Bruckner, for research on polypeptides and proteins, significant from the biological point of view. Second-class Prizes, of £1,000 each : Dr. József Baló and his wife, for research into the pathology of the blood system and the discovery of a new enzyme which digests fibrous tissue ; Dr. Péter Dénes, for an electrolytic method of producing iron and alloy powders used in the telecommunications industry ; Academician Sándor Geleji, for research in the plastic moulding of metals : Academician Géza Hetényi, for work on the diagnosis of ulcer diseases ; Academician Árpád Kiss, for spectroscopic research on aromatic hydrocarbons and hydrated metal ions and complex salts ; and Zoltán Veress, chief engineer of the Karcag factory, for the production of special glasses, *C*9 and *G*28, for the telecommunications industry.

### Scientific Research in the U.S.S.R.

Under the title "Scientific Research in Russia", the Department of Scientific and Industrial Research has issued a translation of a brief survey of recent work which appeared in *Priroda* (1954, (3) 3–10). Some initial and final paragraphs, political in character, have been omitted, and in the absence of a bibliography some references have been added to indicate Russian periodicals received in Britain which are likely to deal with the subjects mentioned. There is still a little polemic ; but the survey indicates the scope of the Russian effort. Much work has been completed on regional tectonics and the problems of magmatogenic mineral deposits. Stress is laid on investigations relating to the construction of turbo-generators, the discovery of new types of solid fuel for metallurgy, the improvement of special alloys for machine construction, and the automatic control of blast and open-hearth furnaces. In the petroleum industry use of the turbine method of boring has been extended, and the gasification of coal has been further developed, as well as the catalytic methanization of water gas and the use of steam at high pressures and temperatures. Contributions in radio-astronomy, the physics of semi-conductors, the development of seismological methods and studies of the effect of molecular structure on the rate of isotope exchange and of the mechanism of poly-condensation are noted, as well as the introduction of a new anaesthetic, promedol, claimed to be more active and less toxic than morphine. Reference is made to studies of the action of phosphatic fertilizers with radioactive phosphorus and of the use of antibiotics for the control of plant diseases ; but, in general, it is stated that radioactive tracer materials have been used to a very limited extent and that use of the electron microscope has been unsatisfactory.

### Visual Recording of Radiation Patterns

Several different types of apparatus have been devised for the formation of visual images of patterns of ionization ; but with the exception of those described by Prof. W. V. Mayneord and co-workers at the Institute of Cancer Research, London, they all present the final picture on recording paper or film. Prof. Mayneord uses the cathode-ray tube, and in earlier models (*Nature*, 168, 762 ; 1951 ; and *Brit. J. Radiol*, 25, 589 ; 1952) a persistent screen was employed. However, at low scanning speeds the persistence was found to be insufficient, and in the most recent model, which has recently been described (*J. Sci. Instr.*, 32, 45 ; 1955), an image-storage tube is used in place of the cathode-ray tube. The picture is built up, line by line, over a long period of time, and then the complete picture is read at any later convenient time. The apparatus consists essentially of two parts : a mechanical device for moving the detector accurately over the required field of examination, and the electronic sections concerned with the detection of the radiation and the ultimate storage and presentation of the final image. The source is scanned in a series of parallel lines, and the maximum area covered can be 18 × 18¼ in. The time taken for scanning a complete frame is approximately six minutes. As the apparatus described was designed primarily for the survey of radiation fields due to γ-ray emitting isotopes, the detector is a coincidence scintillation counter ; but, by the substitution of other detectors, the use of the apparatus can be extended over a wider range of radiations. Full details of the detector system and of the storage tube are given, and problems of resolution and limits of detection are discussed and illustrated by photographs. A minor modification permitting the apparatus to be used for making radiographs is mentioned, and the application of the storage principle to an X-ray spectrograph is stated to be under consideration.

## Kodaikanal Observatory: Report for 1953

In the annual report of the Kodaikanal Observatory for the year 1953 (pp. 10. Delhi: Manager of Publications, 1954; As. 9 or 10*d*.), A. K. Das, the director of the Observatory, deals chiefly with the astronomical work. International co-operation with other observatories continues, and exchanges have been carried out with the Royal Greenwich Observatory, the Observatories of the University of Cambridge, Meudon Observatory, and Mount Wilson Observatory. Quarterly statements relating to solar flares were sent as usual to the Royal Greenwich Observatory and Meudon Observatory. The lists of instruments are classified under five headings: astronomical and spectroscopic instruments, of which thirty-three are catalogued; magnetic, with a total of eight; electronic, including nineteen; workshop machinery, eleven; and under other instruments, of which six are listed; but various other instruments not catalogued, such as galvanometers, photocells, thermo-relays, etc., are also available. Details of sunspot activity-spots, prominences, with the Doppler shifts of the H$\alpha$ line observed in prominences, heights of prominences, etc., are shown in tabular form. Under the research training scheme sponsored by the Ministry of Education of the Government of India, two senior and two junior scholars were working in the Observatory. A list of publications—seventeen altogether—during the year is given at the end of the report.

## Council for the Promotion of Field Studies: Summer Courses

A popular belief that the courses organized by the Council for the Promotion of Field Studies are confined to the summer months is discounted by the issue of the programme setting out the arrangements at each of the field centres of the Council during the autumn. All the usual courses in marine and fresh-water biology, geography and general natural history, rural studies and entomology are being continued, while, in addition, each centre is arranging courses to suit more specialist interests. At Malham Tarn, for example, a short course in meteorology is being arranged during August 24–31, the directors being Dr. C. D. Ovey (University of Cambridge) and Dr. R. S. Scorer (Imperial College of Science and Technology, London). A week's course in surveying and map-making will be held at Juniper Hall during August 10–17, while courses in the identification and ecology of lichens as well as one on local mosses are being organized at Malham Tarn. A week devoted to the study of fungi is planned for Flatford Mill during September 21–28, while Dale Fort is to hold a course, limited to twelve students, on oceanography during August 24–31. The pamphlet giving the details of these courses is obtainable from the Council at Ravensmead, Keston, Kent, or from any of the above-mentioned field centres.

## Forests of the Upper Nile Province, Sudan, 1862–1950

It is becoming apparent that under the Sudanization plan a large number of the British officials left in the Sudan Administration have decided to resign. In the case of the Forest Department, it is to be hoped that this will not result in a serious setback to the excellent work of the past eight years or so (see the annual report for 1951–52, reviewed in *Nature*, 173, 903; 1954). The good work of past years is further exemplified by Memoir No. 5 of the Sudanese Forestry Division, Ministry of Agriculture, entitled "Forests of Upper Nile Province, 1862–1950", by G. A. Booth (Khartoum, 1952). This brochure, which has excellent illustrations, is a most valuable piece of research work. After a reference to the evidence of Roman explorers and archæological evidence that the belt of high forest which stretched over Central Africa once extended as far north as Khartoum, Mr. Booth sets himself to examine how far in the provinces the forests have been overcut to supply the large demands for wood fuel made both by the towns and the river steamers since Sir Samuel Baker's time in the 1860's. It is too early to be able to agree with Mr. Booth's suggestion that possibly the supposed overcutting of the scattered forests to supply this growing demand for fuel has not seriously affected the forests on the areas from which the fellings were made.

## University of Birmingham

In the University of Birmingham the title of reader in analysis in the Department of Mathematics has been given to Dr. B. Kuttner, and that of reader in mycology in the Department of Botany to Dr. C. J. Hickman. The following have been appointed lecturers in the University: Dr. G. W. Hutchinson (physics), Dr. T. S. West (chemistry), R. Humphreys (civil engineering), Dr. Ingeborg Gurland (education—child development) and C. J. Phillips (education—psychology).

A postgraduate course in coal preparation leading to the degree of M.Sc. by examination has been established in the University; the course will consist of lectures and laboratory and tutorial classes during the normal session, and will be followed by a project carried out on an industrial coal-preparation plant or on the pilot plant of a manufacturer of coal-preparation appliances.

In the Department of Pharmacology a grant of £1,500 a year for three years has been given by Quaker Oats, Ltd., for research into the chemistry and nutritional value of cereals.

## Zoological Publications of W. D. Selensky

Prof. M. C. Meyer, professor of zoology in the University of Maine, writes to say that after considerable searching he finally obtained from abroad a copy of Waldimir D. Selensky's "Études morphologiques et systématiques sur les Hirudinées: I. L'Organisation des Ichthyobdellides", published in Leningrad (then called Petrograd) in 1915 (pp. viii + 246, 41 fig. + 8 plates; in Russian). A photostatic copy was made, and afterwards a complete translation of the text was arranged. At the time of his death in 1931 Prof. Selensky was a leading zoologist in the U.S.S.R., being head of the Parasitological Department, University of Leningrad, and his researches were devoted chiefly to the morphology, biology and the systematics of leeches, the most important contribution being the above-mentioned publication. Museum and university librarians interested in obtaining a copy of the English translation, with text-figures and plates, should write to Prof. Marvin C. Meyer, Department of Zoology, University of Maine, Orono, Maine.

## Colonial Service: Recent Appointments

The following appointments have recently been made in the Colonial Service: D. D. Campbell (agricultural officer, Uganda), principal agricultural officer, Basutoland; R. G. Heath (deputy director of agriculture, Federation of Malaya), director of agriculture, Federation of Malaya; J. Hughes-Rice (agricultural officer, Kenya), provincial agricultural officer, Kenya; L. Johnson (economic botanist, Trinidad), senior agricultural officer, Mauritius; J. A. Sandys (agricultural officer, Nyasaland), chief agricultural officer, Nyasaland; A. H. Savile (regional assistant director of agriculture, Tanganyika), chief agriculturist, Kenya; A. I. Biggs (chemist, Department of Chemistry, Federation of Malaya), chief chemist, Department of Chemistry, Federation of Malaya; T. G. E. Gibson, assistant director of agriculture and veterinary services, Somaliland Protectorate; M. N. Harrison, plant breeder, Kenya; F. J. Smart, agricultural officer, Northern Rhodesia; L. S. Todd, agricultural officer, Uganda; B. L. Lawrence, assistant conservator of forests, Gold Coast; G. H. D. Williams, assistant conservator of forests, Northern Rhodesia; I. G. Gass, geologist, Cyprus; P. I. Morris, geologist, British Guiana; H. C. Ruick, horticulturist, Cyprus; G. H. Lampkin, research officer, East African Agriculture and Forestry Research Organization; R. Hopes, veterinary officer, Uganda.

## Royal Meteorological Society: Officers for 1955–56

THE following have been elected officers of the Royal Meteorological Society for the year 1955–56: *President*, Dr. R. C. Sutcliffe; *Vice-Presidents*, C. K. M. Douglas, Prof. G. Manley, Sir Graham Sutton, Dr. T. W. Wormell; *Vice-President for Canada*, Dr. D. P. McIntyre; *Vice-President for Scotland*, Sir Ernest Wedderburn; *Treasurer*, Dr. J. S. Farquharson; *Secretaries*, Dr. A. G. Forsdyke (*Librarian*), Dr. H. L. Penman, Dr. G. D. Robinson (*Editor*), R. G. Veryard.

## Plant-Growth Substances: Conference at Wye College, Ashford

A THIRD international conference on plant-growth substances will be held in Wye College (University of London), Ashford, during July 17–22. Nearly seventy people will be participating, twenty-six of whom will be from overseas countries as follows: United States, twelve; Sweden, five; Germany, four; Austria and The Netherlands, two each; and Norway, one. The following topics will be discussed (the chairmen are shown in brackets): natural auxins (Prof. H. Veldstra and Dr. G. S. Avery); chemical structure and biological activity (Dr. J. Bonner and Prof. T. A. Bennet-Clark); metabolism of auxins (Prof. P. Larsen); mode of action of auxins (Prof. L. J. Audus). Further information can be obtained from the honorary secretary of the conference, F. Wightman, Wye College, Ashford, Kent.

## Conference on the Physics of Nuclear Reactors

THE Institute of Physics is arranging a conference in London on "The Physics of Nuclear Reactors" during July 3–6, 1956, to be opened by Sir John Cockcroft with an address on the "Scientific Problems in the Generation of Nuclear Power". The primary purpose of the conference is to keep members of the Institute, particularly those engaged in industry, informed about recent developments in reactor physics and the cognate scientific and technical subjects, and to tell them of the problems awaiting solution. Further details will be announced in the autumn of 1955, which will include the procedure by which non-members may be considered for invitations to attend the conference.

## Announcements

DR. R. VAN DER RIET WOOLLEY, Commonwealth Astronomer and professor of astronomy in the Australian National University, Canberra, has been appointed Astronomer Royal at the Royal Greenwich Observatory in succession to Sir Harold Spencer Jones, who is to retire on December 31.

THE Paris Academy of Sciences has elected Lord Cherwell, Dr. Lee's professor of experimental philosophy in the University of Oxford, and Prof. G. Cassinis, director of the Polytechnic of Milan, to be *correspondants* for the Sections of Free Academiciens and of the Applications of Science to Industry.

DR. F. P. BOWDEN, reader in physical chemistry in the University of Cambridge, has been awarded an Elliott Cresson Medal by the Franklin Institute, "for his extensive experimental investigations of the friction between solid surfaces, investigations which combine simplicity and clarity, and for his findings regarding the detailed nature of the processes involved when one metal slides over another".

SIR JAMES CHADWICK, master of Gonville and Caius College, Cambridge, and formerly Lyon Jones professor of physics in the University of Liverpool, has been elected an honorary Fellow of the Institute of Physics.

THE Oceanographical Institute of Monaco has awarded its Commemorative Medal of Prince Albert I of Monaco (the Manley-Bendall Prize) to Dr. J. N. Carruthers, director of the National Institute of Oceanography [of Great Britain], for his distinguished work in physical oceanography.

GENERAL MATTHEW B. RIDGWAY, who recently retired from his post as chief of staff of the United States Army, has been appointed chairman of the Board of Trustees of the Mellon Institute of Industrial Research, Pittsburgh, Pa., with the responsibility of being the chief administrator of the Institute as well as acting for the Trustees in promoting their plans to expand the Institute's staff and scientific programmes. Dr. E. R. Weidlein will continue in his post as president of the Institute.

DR. S. WHITEHEAD, director of the Electrical Research Association, has been re-elected chairman of the Committee of Directors of Research Associations for a further year.

THE triennial award of the above Prize and Medal has been made by the Council of the Institution of Electrical Engineers to Mr. D. McDonald for his paper on "The Electrolytic Analogue in the Design of High-Voltage Power Transformers". The prize, which consists of a bronze medal, a certificate and about £20 in money, is awarded for the best paper on a professional subject published by the Institution during the period of the award; but only authors who are corporate members less than thirty-five years of age are eligible.

THE European Molecular Spectroscopy Group is meeting in the University of Oxford during July 7–11.

THE Nutrition Society is arranging a symposium, to be held in the Physiology Laboratory, University of Oxford, during July 8–9, on the nutritional work of the United Nations Food and Agriculture Organization, the World Health Organization, and the United Nations Children's Fund. Further information can be obtained from Dr. H. M. Sinclair, Laboratory of Human Nutrition, 10 South Parks Road, Oxford.

# NEW VISCOSE RESEARCH LABORATORY OF COURTAULDS, LTD.

THE new viscose research laboratory of Courtaulds, Ltd., has recently been completed at Coventry and was on view to visitors during the week commencing May 16. This is the latest, and at present the largest, of the Company's six research laboratories. Together with its associated pilot plants, the laboratory will be devoted almost entirely to research and development work on the manufacture of regenerated cellulose fibres by the viscose process. Broadly speaking, its main objects are to effect major improvements in the properties of the fibre and to develop improved methods of manufacture. Its activities will range from fundamental to large-scale technological work in a broadly based programme.

The man-made fibre industry operates to-day on a very large scale; it is not generally realized that it supplies nearly 20 per cent of the world's textile requirements. Of its annual world output of some two million tons, about 80 per cent is produced by the viscose process. Originally the only product of this process was continuous-filament textile yarn. The viscose process has, however, proved remarkably flexible; the range of its products has progressively widened, and to-day includes special high-tenacity yarns used mainly for industrial purposes and a number of different types of staple fibre. With the expanding range of outlets, a host of new problems has arisen in developing fibres specially suited to particular end uses.

The raw material of the industry is cellulose, predominantly in the form of highly refined wood pulp. It is abundant and relatively cheap, as are the other major chemicals employed. The industry is therefore in a position to expand its output to keep pace with the world's ever-increasing demand for textiles.

The processes involved in the production on an industrial scale of regenerated cellulose fibres with properties suited to their various uses are complex and inherently difficult to investigate; even after fifty years of activity the industry still presents many problems of considerable depth which remain to be solved. In the early days, considerable progress was made despite the lack of understanding of the background science; but the time has now come when progress will depend increasingly on a thorough understanding of the physical and chemical changes which take place during the production of the viscose solution, its extrusion into a coagulating bath and the subsequent regeneration of cellulose in the form of filaments with properties suited to their end use. A major aim of the new research laboratory will be to provide this essential background.

In the field of textile science it is not yet possible to describe satisfactorily in terms of measurable parameters many of the properties of fabrics such as drape, handle or durability, which control both their functional behaviour and their appeal to the customer. It remains also to relate these textile properties in a satisfactory manner both to the details of fabric construction and to the properties of the fibres from which they are made. The man-made fibre industry has always striven to produce fibres with the most useful properties, and, for an intelligent approach to this problem, it is necessary to relate these properties to the chemical nature of the building unit—the linear polymer molecule—and to the fine structure and morphology of the fibre. Only by the fundamental study of these problems can technological progress be firmly based, and the work of the individual sections of the new laboratory is integrated with these general aims in view.

The raw material, wood pulp, is being studied in relation to its subsequent behaviour in the viscose process and to the properties of the ultimate fibre. Some of this work is carried out in collaboration with pulp producers, and it is an interesting example of the power of co-operative effort that it has already produced useful results in a difficult field of investigation.

The extrusion or spinning of viscose solution through the fine holes of a spinnerette into an acid coagulant produces filaments of regenerated cellulose by a variety of chemical and physical processes which occur with great rapidity. Persistent physico-chemical study is slowly clarifying the picture; but the basic research tool is undoubtedly the single-end spinning machine. Direct investigation of spinning phenomena based upon the indications of more fundamental work yields positive information about the physical and chemical conditions which control the formation and properties of the filament. Every attempt is made to build the necessary basic properties of strength, flexibility and elasticity into the fibre. In addition it is possible, by the incorporation of extremely fine dispersions of white or coloured pigments into the viscose solution, to modify the lustre of the yarn and to produce a wide range of extremely fast colours. This latter development is particularly important in the field of staple fibre where many of the end uses call for extreme colour fastness and where additional effects can readily be obtained by blending fibres of different colours.

The properties of regenerated cellulose fibres can also be modified by chemical after-treatment. This is very largely the province of the organic chemist who is able to control the degree of swelling in water by means of cross-linking reactions, to confer water repellency, the power of adhesion to rubber and many other specific properties by the use of suitable reagents.

In order to facilitate the rapid utilization of research results in production, the laboratory is associated with extensive pilot plants and has a large engineering section.

The new building, which is steel-framed with floors and roof of pre-cast concrete beams, consists of a basement and four floors of laboratories in the main block. An office wing links it to an existing administrative block. The 'Cotswold grey' brick façade overlooking the main Foleshill Road contrasts with the extensive glass area of the laboratory windows on the other three sides of the building, and insulates the working areas from street noises; at the same time a maximum amount of light reaches the working areas.

On each floor the laboratories are situated on both sides of a central corridor. They are based on a standard module of 25 ft. 6 in. × 11 ft. 9 in. Provision is made for supplying all services to every module so that the internal layout can readily be modified to suit changing requirements. The services are distributed by horizontal mains running at high level throughout the basement, with branches rising up vertical ducts on each side of the central corridor. From these vertical risers branch-pipes are taken through shallow floor-ducts to the laboratory benches. The services include high- and low-pressure steam; electrical power; cold, hot and demineralized water; coal gas; compressed air and vacuum; and brine for cooling. The building is heated and ventilated by warmed and filtered air distributed from a plant in the basement by a plenum system which is directed into three zones per floor; each zone has a subsidiary heater which is under local thermostatic control. Special air-conditioning is provided for the textile research and testing laboratories where constant temperature and humidity conditions are required.

The new laboratory was designed by the Company's architects and engineers in consultation with the scientific staff and completes the post-war development of Courtaulds' viscose research facilities. Major extensions of the Company's other laboratories are in progress.

# MICROWAVE AND RADIO-FREQUENCY SPECTROSCOPY

## FARADAY SOCIETY MEETING

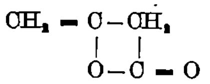
A THREE-DAY meeting of the Faraday Society was held in Cambridge during April 4–6, when the subject of the discussion was "Microwave and Radio-frequency Spectroscopy". The president, Prof. R. G. W. Norrish, opened the meeting, at which more than two hundred members were present, by welcoming more than a hundred British and foreign guests; these included contributors from Denmark, France, Germany, the Netherlands, Switzerland, the United States and the U.S.S.R.

Ten years ago the subject of microwave and radio-frequency spectroscopy embraced essentially only one experiment, namely the direct detection of the inversion frequency of ammonia by C. E. Cleeton and N. H. Williams. Consequently, the majority of members of the Society were not taught anything about low-frequency spectroscopy during their student days. Since the techniques involve a considerable amount of advanced physics and electronic engineering, most members had not had an opportunity of gaining first-hand experience and, as a consequence, were very glad of the opportunity of learning directly from the pioneers and of judging for themselves the possible applications of the new techniques to their own individual interests. They learned that a wide range of topics was concealed under the narrow-sounding title, and there were important contributions to the following subjects: chemical structures, geometrical structures of molecules, electronic structures, thermodynamics, equilibria, molecular kinetics, electrochemical kinetics, botany, biology and astronomy.

In the formal sessions, thirty papers were presented and discussed. Since a summary which would do full justice to these would either be very lengthy or would assume the reader to possess a detailed background knowledge, the rest of this article will enumerate the results presented without detailed reference to the manner in which they were obtained. Besides the original work, there were several contributions which were wholly, or in part, of an introductory or review nature. In the latter class were the accounts of nuclear properties (H. C. Longuet-Higgins), microwave or pure rotation gas spectroscopy (W. D. Gwinn; W. Gordy), non-resonant electron absorption in flames (T. M. Sugden), paramagnetic electron resonance in compounds with metal ions (J. H. E. Griffiths), free radical electron resonance (G. E. Pake), nuclear magnetic resonance (H. S. Gutowsky), and quadrupole resonance in solids (H. G. Dehmelt).

### Chemical Structure

When presented with any material, a chemist's primary task is to determine the structural formula. The structure of diketene has been established to be

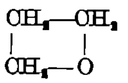


$$\begin{array}{l} CH_2=C-CH_2 \\ \quad\;\; | \quad\;\; | \\ \quad\;\; O-C=O \end{array}$$

by P. T. Ford and R. E. Richards from the proton resonance of the solid, and this has been confirmed by entirely distinct evidence, from the chemical shifts in the liquid, presented by H. S. Gutowsky. The latter type of experiment is relatively rapid and easy to interpret qualitatively, and already a table of characteristic shifts has been established and is likely to have many applications analogous to those of a table of characteristic infra-red absorption frequencies. Also, elegant proofs of the correctness of the bridge structures for diborane, for the pentaborane pyramid, and for the decarborane basket, were given by J. N. Shoolery using the nuclear 'double resonance' technique. A rather different identification of a structural unit is that of E. E. Schneider, who used the electron resonance of the free radicals obtained by the degradation of polymers by irradiation with X-rays; with polythene the evidence points to predominantly $-CH_2$ and with 'Teflon' to $-CF_2$ ends to the free radical chains. Another experiment is that of R. R. Livingston *et al.*, who identified hydrogen atoms trapped in phosphoric acid, sulphuric acid and perchloric acid on irradiation with γ-rays at 77° K.

### Geometrical Structure

For compounds of established chemical structures, a chemist is interested to discover the geometrical structure, that is the bond distances and angles, and microwave gas spectroscopy is a powerful tool for this purpose. W. D. Gwinn reported that trimethylene oxide,



$$\begin{array}{l} CH_2-CH_2 \\ | \qquad\;\; | \\ CH_2-O \end{array}$$

has a strictly planar central skeleton. J. Sheridan *et al.*, reporting the dimensions of methyl diacetylene, found the $CH_3$—C bond to be 1·46 A. and the central single bond between the two triple bonds to be 1·37 A., and these figures show a marked shortening with respect to the C—C bond in ethane, which is 1·54 A. Another short C—C bond is that reported by B. Bak *et al.*, who found 1·44 A. for the $C_{(3)}$—$C_{(4)}$ bond in furan. Nuclear resonance can be used for locating hydrogen atoms, and E. R. Andrew and D. Hyndman have used it for showing that in the solid state the hydrogen atoms of urea lie in the $CON_2$ plane. The accuracy of the method is shown by the results of

L. E. Drain, who showed that in ammonium fluoride crystals the N—H distance is 1·04 A. and the H—F distance 1·64 A., which is in complete accord with the X-ray value of 2·67 A. for the N—F distance and shows that the nitrogen, hydrogen and fluorine atoms are collinear. Structural information of another type is shown in the work of B. M. Kozyrev, who showed the electron resonance of $Cr^{+++}$, $Mn^{++}$, $Cu^{++}$, etc., in solution to be very similar to that of the hydrated salts, and so the short-range order in the hydration sheaths must be very similar in the two states.

## Electronic Structure

After the atomic positions have been settled, the chemist's next questions concern the electron distribution, and the new techniques give four new types of experimental evidence with which to supplement the energies, dipole moments and polarizabilities that have hitherto provided the major experimental checks on proposed wave functions. However, the newer quantities all refer to interactions with the nucleus and are most sensitive to the electron distribution near the nucleus, a region for which otherwise satisfactory wave functions have not previously been tested. In particular, a difficulty arises with the overlap integral required in the normalization of a molecular wave function constructed from two atomic functions, since this must be set to zero for satisfactory interpretation of the new data. Consequently, although the experimental quantities are accurately known, the interpretation has not reached a similar precision and is still a matter for individual opinion. The most often measured quantity is the second derivative of the electric potential at the nucleus, $\partial^2 V/\partial z^2$, which is obtained from nuclear quadrupole couplings. Both W. Gordy and B. P. Dailey discussed the interpretation and showed that information could be obtained about the degree to which the valency $p$ atomic orbitals are used in chemical binding and also about the relation of ionicity to electronegativity differences. The zero coupling found for cæsium chloride vapour confirms the wholly ionic nature of the bond, while the large coupling in a chlorine molecule confirms the essentially $3p_z$ character of the atomic orbitals involved in the bond. Many compounds, including methyl chloride, show an intermediate coupling for the chlorine nucleus; but the amount of reduction due to ionic character and the amount due to $sp$ hybridization depend on the choice of assumptions, since it is impossible to obtain two unknowns from one numerical observation.

The second experimental quantity is $\psi(0)$, the value at an atomic nucleus of the wave function of an unpaired electron in a free radical or a metal ion. $\psi(0)$ is only non-zero for an $s$ atomic orbital; but unpaired electrons are normally in $p$, $d$ or $f$ orbitals. Nevertheless, a coupling is found even in these cases, and it must be the consequence of admixture of a few per cent of $s$ character through configuration interaction, a complication which is omitted in many approximate theoretical calculations made for other purposes. Thus it is at present difficult to give a numerical value for the proportion of time an electron spends at each atom. But it is clear, from the results presented by G. E. Pake, that in triphenyl methyl the unpaired electron is principally on the central carbon atom, whereas in the isoelectronic triphenylamine positive ion the greater attraction of the nitrogen for electrons ensures that it is surrounded by electron pairs and the unpaired electron is relegated to the phenyl rings.

If the central atom is a metal ion surrounded by an octahedral complex in a crystal, a more detailed treatment is possible, and this was outlined by J. Owen. He showed how $d$ orbitals of the central atom may accept a pair of electrons from a chlorine ion, water molecule or other group in the complex shell, and how in exchange the unpaired electron from the metal resides partly on the outer group. The new bonds to the metal may be $\sigma$ bonds formed through endwards overlap of the $d$ orbitals, or $\pi$ bonds formed through sideways overlap. An example of the $\sigma$ type is $[Cu(H_2O)_6]^{++}$, where the unpaired electron is present to 2·3 per cent on each water molecule, and an example of the $\pi$ type is $[IrCl_6]^{-}$, where the unpaired electron is 5 per cent on each chlorine ion. For the trans-uranic elements, the susceptibilities and the resonance experiments, described by B. Bleaney, show that the $5f$ rather than the $6d$ shell is used for accommodating unpaired electrons and that one of the $5f$ orbitals is probably involved in bonding to the oxygen in the $UO_2^{++}$, $NpO_2^{++}$ and $PuO_2^{++}$ ions. C. H. Townes discussed the other interactions and showed that nitric oxide is best described as 65 per cent $N{=}O$ and 35 per cent $N^{-}{=}O^{+}$; he further indicated the principle by which magnetic effects could be used for determining absolutely the sign of an electric dipole moment.

## Thermodynamics, Potential Barriers and Equilibria

After a chemist has fully determined the molecular structure of a compound, he may be interested in its thermodynamic properties in bulk, and in this connexion P. T. Ford and R. E. Richards showed the barriers opposing rotation of the $BH_4^-$ ion to be 2·4, 3·8 and 3·9 k.cal./mole in the sodium, potassium and rubidium salts, respectively. Also using nuclear resonance, J. A. S. Smith has been able to relate the intermolecular motions in 'Teflon' to its λ-point transitions. A value of only 6·00 cal. for the six-fold internal rotation barrier in nitromethane, $CH_3NO_2$, was reported by W. D. Gwinn from the microwave spectrum, and this value is reduced to 5·17 cal. in $CD_3NO_2$, where the bending vibrations have a smaller zero-point amplitude. These very low values suggest that the three-fold barrier opposing each oxygen is close in shape to a pure cosine function, so that the barriers for two oxygens cancel almost exactly. This adds confidence to the acceptance of the many barriers previously obtained from specific heats on the assumption of a cosine shape. Barrier information was also obtained from nuclear resonance by R. A. Ogg and J. D. Ray, who found that in the hydrogen bridge compound $Al(BH_4)_3$ each $BH_4$ unit is capable of rotation by means of a tunnel effect at a frequency greater than $10^8$/sec., even though the barrier height is above 14 k.cal.

Equilibria were discussed by T. M. Sugden, who described how the non-resonant microwave absorption by the electrons in flames leads to a study of reactions such as

$$Li + OH \rightleftharpoons LiOH$$

for which the heat of reaction is 102 k.cal./mole, and also to the less-expected reaction

$$CaO + H_2O \rightleftharpoons CaOH^+ + OH^-$$

for which the heat is 96 k.cal./mole. From related experiments, F. M. Page has found the electron affinity of the hydroxyl radicals to be 65 ± 1 k.cal./mole.

## Kinetics

In cases of known equilibria, the chemist is interested in the rates of attainment of such states, and W. A. Anderson and J. T. Arnold were able to show that in extremely pure alcohol the exchange of protons between molecules occurs less than once per second, but that with $10^{-5}$ gm.-ions/l. of $H^+$ present the nuclear resonance lines broadened, indicating the reaction

$$[C_2H_5OH_2]^+ + C_2H_5OH \rightarrow C_2H_5OH + [C_2H_5OH_2]^+$$

to have a mean time between exchanges of about 0·2 sec. There was also mention of an unusual type of oxidation-reduction reaction, namely, the exchange of an electron between naphthalene and its negative ion

$$C_{10}H_8^- + C_{10}H_8 \rightarrow C_{10}H_8 + C_{10}H_8^-,$$

for which S. I. Weissman *et al.* found a second-order rate-constant of $10^{-8}$ l.mole$^{-1}$ sec.$^{-1}$ at 30° C. from electron resonance experiments.

This covers the major divisions of chemistry with the exception of preparative work, and even R. A. Ogg's postulate of $Al_2B_4H_{18}$ formed reversibly on heating $Al(BH_4)_3$ might be classed in this field. For the botanist and biologist, G. E. Pake *et al.* have shown that germinated foxglove seedlings (digitalis) contain free radicals which were absent in the ungerminated material, and that free radicals are also present in metabolically active liver and kidney tissues. D. J. E. Ingram and J. E. Bennett have investigated phthalocyanine and hæmoglobin metal ion resonances and showed these to be sensitive to structure. Finally, as regards this account, there was a description of a molecular oscillator by N. G. Basov and A. M. Prokhorov which should be stable to better than 1 in $10^9$, that is, 30 msec./year. Such an oscillator coupled to a clock mechanism should be a useful tool for astronomers; C. H. Townes reported that initial experiments have approached this figure for the stability.

Thus it can be seen that not only must the Faraday Society be congratulated on a most successful meeting worthy of ranking beside the best of its predecessors, but also that it must be congratulated on a brave and opportune choice of subject.

D. H. WHIFFEN

# SCIENCE AND BRITISH RAILWAYS

THE part that science can play in the improvement of railways is not so much in the production of, say, better locomotives, as in the impartial study of a great variety of problems arising in the railway business as a whole. Some of these problems and the way they are approached were described by T. M. Herbert, director of research, British Railways, in a recent lecture to the Manchester Literary and Philosophical Society (*Manchester Memoirs*, 95, No. 8). Of the two hundred scientific staff who make up the research department of British Railways, not more than a quarter are engaged on definite research projects, the others being concerned with some form of scientific service requiring the employment of staff with a scientific training and outlook.

The true function of a railway is to provide a transport service for passengers and freight, and to move them from point to point as safely, as efficiently and as cheaply as possible. It is only an incidental to providing such service that the railways need conduct a vast engineering business in the manufacture of such things as locomotive and rolling stock. Only about one-third of the annual expenditure is devoted to the engineering side of the business, that is, the construction and maintenance of locomotives and rolling stock, the maintenance of buildings, structures and track, etc.

It has been suggested that research on equipment and materials used by railways could probably and perhaps better be carried out by the industry concerned with the manufacture of such equipment and materials. There is some truth in this belief. A railway is so much concerned with the subsequent performance, reliability and maintenance of its physical equipment, however, that much of its research and study can only be carried out by railway staff on the equipment and material during its actual life.

Another argument for the existence of a scientific service within the railways is that it ensures that the results of scientific development in the universities, other industries and other fields are not ignored.

The varied nature of the activities and problems of the railways provide for a scientific service employing chemists, engineers, metallurgists, physicists, mathematicians, as well as those trained in economics and statistical methods. British Railways are almost unique among railway administrations in having grouped their scientific resources into a single department; it has made possible the formation of a sizable unit in place of a number of small groups which would probably have been less effectively staffed and equipped.

The Research Department of the Railways comprises three main groups, the first consisting of the engineering, metallurgical and physical laboratories which are at Derby, the second consisting of a group known as Chemical Services, and the third a small group known as the Operational Research Division. The first group is almost entirely concerned with research proper, some of it carried out in the laboratory but a good deal of it in the field; the second group provides chemical service from a number of laboratories located throughout the country at important railway centres, with specialized laboratories dealing with protective coatings, corrosion, building materials and textiles. The Operational Research Division is centred in London; but its staff operates wherever required. The annual budget amounts to about a quarter of a million pounds. There is a smaller but similar unit within the London Transport Executive, and the Docks and Inland Waterways Board of Management.

The work of the chemist consists of the examination of materials used by the railways; the laying down of specifications; the examination of new materials offered by industry and services of a more specialized nature like the chemical and bacteriological control of water supplies. There is also a de-infestation service, in respect of premises, vehicles, and stored products such as foodstuffs, tobacco, hides and skins, wool and other fibres. The chemists also perform important and essential advisory work in connexion with the classification of rail traffics for charging purposes, on safeguards in their conveyance and storage, and in the investigation of alleged damage to goods in transit. Other typical examples of chemical investigations are those into the materials used in the making of railway detonators and into the suspected deterioration in old brickwork.

Problems arise in the physical study of the ventilation and heating of passenger vehicles. The fully air-conditioned coach with sealed windows is scarcely justified in our climate, and the tradition of the open window dies hard. Nevertheless, the present type of sliding ventilator seems to be a reasonable compromise, and extensive air-flow explorations and wind-tunnel tests were conducted when it was adopted. The heating problem is closely associated with a proper knowledge of the air-flow within a compartment or coach; but there is an inherent difficulty in heating the end of a long train. The passage of steam through a long, and by no means straight, pipe from the engine to the fifteenth coach involves the study of a rather complicated heat-balance problem.

The Physics Division is concerned with a very diverse series of problems. Some of these have been concerned with the analysis of data obtained in the course of engineering investigations, including locomotive testing and train resistance studies. Others have formed a direct or an alternative attack on problems involving vibration, elasticity and heat transfer. Among the vibration problems was the study of the behaviour of a machine for carrying out fatigue tests on full-size rails, in which the rail carried a number of attached masses on one of which acts a harmonically varying force.

During the past few years, the investigation of the relative merits of the vacuum and air brake for freight trains has occupied much attention from the research engineer. The fitting of continuous brakes would greatly speed up the whole tempo of railways operating, by closing the gap between the speed of passenger and freight trains, thus reducing delay and increasing line capacity. With very long trains, which may be either empty or loaded, there are serious technical problems in ensuring that the brakes are applied to each wagon as simultaneously as possible, and in releasing the brakes quickly after a full brake application.

The largest single group of engineering research studies relate to the track. One large-scale experiment is in hand to try to assess the optimum depth of ballast, and important work is also in hand to determine the lateral resistance of ballast, which becomes of special moment in the case of long-welded rails. The behaviour of concrete sleepers of various designs and methods of attaching the rails to them are also being continually studied at the present time.

There is also the problem of the rails themselves. Rails in Britain fail primarily by fatigue in the top fillets or at the bolt holes at the joints, and laboratory equipment has been developed for fatigue testing complete rails.

The other aspect of the rail problem is more of a metallurgical character. In course of time rails are replaced because the section, and therefore the strength, has been reduced by wear and corrosion. On the running surface of the rail these two influences combine in producing loss of metal from the rail head. In Britain, with its relatively humid climate, corrosion occurs at the initial corrosion-rate between the passage of successive trains, and by improved methods of wear measurement and axle counting much new data are being accumulated on the problem.

The operational research teams have studied such subjects as the logical basis for bonus payment systems, the present-day facilities for conveying passengers' luggage, and the proper quarter on which to place responsibility for the issue of station stores. Other work of great importance has been the study of the use of locomotive coal, both in hauling trains and during standby periods.

# ROYAL TECHNICAL COLLEGE, GLASGOW

## REPORT FOR 1953–54

THE report on research during the session 1953–54 at the Royal Technical College, Glasgow*, gives a brief conspectus of research pursued in the various departments which conduct research programmes. Under each of these departments is given a list of theses submitted for higher degrees and a list of publications in which the titles are amplified by brief abstracts or annotations.

Research in the Department of Mathematics has been concerned with gas dynamics, the applications of blanket transforms in statistics, and the applications of new complex-variable techniques in problems arising in elasticity. In the Department of Natural Philosophy, work has continued in collaboration with the Technical Chemistry Department on the effects of polishing and annealing on the surface structure of finely ground quartz and vitreosil. In geophysics reasons have been sought for the sudden increase in electrical conductivity, to metallic character, within the earth's mantle at a depth of about 700 km. Research continued on the properties of both metallic and non-metallic evaporated films, and an electron-microscopic study was made of the hydrochlorination of natural (*Hevea*) rubber and various synthetic polyisoprene lattices covering a tenfold range of particle size. In the Department of Chemistry research on natural products continued as a major activity in the organic laboratories, while in the physical and inorganic laboratories the study of the photochemical properties of solutions of ferric iron continued and the critical micelle concentrations of some long-chain detergents were being measured by colorimetric and fluorimetric methods.

Research in the Department of Technical Chemistry was concerned with three main fields: the properties and processing, particularly dyeing, of natural and synthetic high polymers; the pyrolysis of organic substances; and the surface chemistry of finely divided solids and of liquid/gas and gas/liquid dispersions. The research programme of the Department of Metallurgy continued to be concerned chiefly with slag/metal relations; but interest in powder metallurgy was extending.

R 306

The Department of Civil and Mechanical Engineering undertook, as in previous years, a wide range of short-term investigations for local industries, while in the Department of Electrical Engineering, besides the main work on high-voltage and heavy-current phenomena, postgraduate work in electronics has developed and a new line of research on non-linear servo-mechanisms was commenced. The Department of Mining Engineering has investigated the resistance to airflow of different roadway linings and tubs at varying spacings, and in the Department of Architecture, Town Planning and Building investigations related to timber structure have been made, in addition to postgraduate studies and planning reports on the history, present condition and development of Campsie, Cumbernauld, Galston, Kilmacolm, Uddingston and St. Andrew's Square, Glasgow. Research activities of the School of Pharmacy and School of Bakery fall into five main groups: pharmaceutical and pharmacological; pharmaceutical chemistry; microbiological; biological; and biochemical.

# NEW MATERIALS AND PROCEDURES FOR GENETIC STUDIES OF YEASTS*

## By Dr. LYNFERD J. WICKERHAM

Fermentation Section, Northern Utilization Research Branch, Agricultural Research Service, U.S. Department of Agriculture, Peoria, Illinois

UP to the present, the only species of *Saccharomyces* which have been hybridized are a few that are closely related to *S. cerevisiae*, the type species of the genus. *Saccharomyces*, as defined by Lodder and Kreger-van Rij[1], is composed of several groups of species, some being very different from *S. cerevisiae*. One group consists of *S. lactis*, *S. fragilis* and *S. marxianus*, and species which have been described under the names of *Zygosaccharomyces ashbyi* and *Z. dobzhanskii*. I intend to place these species and several others in a new genus called *Dekkeromyces*, named in honour of Dr. N. M. Stelling-Dekker.

The low average germination of ascospores in strains of *Dekkeromyces* precludes the usual micromanipulator procedures; but hybridization by a very simple procedure has been successful. Cells of the two species to be hybridized are mixed on a slant of malt-extract sporulation medium (for composition of media, see ref. 2) and incubated for ten days at 25° C. Cells on the lower part of the ten-day-old agar-slant culture are mixed thereon and streaked on a second slant. A total of four similar serial transfers is sufficient to produce hybrids if the strains are compatible.

Two methods are used for separating the hybrids from the parent cells. The first is based on the fact that, in most species of the anticipated genus *Dekkeromyces*, strains vary widely in the amount of red pigment which they produce on malt extract–yeast extract agar and on morphology medium. When weakly chromogenic strains are mated, strongly pigmented hybrids are produced. The red pigment is related to pulcherrimin[3], and I have found it to have antibiotic activity. The pigmentation of the hybrids permits their ready recognition.

In the second method, species differing in the carbon sources which they assimilate are hybridized. For example, one parent may assimilate maltose, the other lactose, and some of the hybrids will assimilate both. The mixture of hybrids and parents are grown in a series of shaken flasks containing maltose as the only source of carbon (except for a trace in the vitamins of the medium), thus eliminating the parent which cannot assimilate maltose. Then cells from the last maltose flask are transferred serially in lactose medium, which eliminates the parent that does not assimilate lactose, thus yielding a culture of the hybrids.

Species have been hybridized which are very different in their sexual characteristics. For example, *S. lactis*, which is heterothallic and completely haploid, has been hybridized with *Z. ashbyi*, which is homothallic and predominantly diploid, to yield hybrids some of which are exclusively diploid (or possibly triploid). Some of the hybrids are homothallic, some are heterothallic, and others produce only a few, infertile ascospores.

Physiologically, a maltose fermenter (*Z. dobzhanskii*) has been mated with a lactose fermenter (*S. fragilis*) to produce the first ascosporogenous yeasts known to ferment both these sugars. *Saccharomyces fragilis* is unable to attack the alpha-glucosides maltose, melezitose or alpha-methylglucoside; but it ferments lactose. *Zygosaccharomyces dobzhanskii* ferments alpha-glucosides but has no action on lactose. Hybrids produced by these two species ferment the alpha-glucosides less actively than does *Z. dobzhanskii*, and the hybrids produce variants which range downward in activity, with some having no ability to ferment and almost no ability to assimilate alpha-glucosides. Yet all the hybrids and their variants ferment lactose.

Persons interested in studying genetics of these species may obtain appropriate strains from the Northern Utilization Research Branch, Agricultural Research Service, U.S. Department of Agriculture, Peoria, Illinois.

# LONG-DISTANCE PLANT DISPERSAL IN THE NORTH POLAR REGIONS

## By Dr. NICHOLAS POLUNIN

ONE of the most familiar and provocative phenomena in plant geography is the occurrence of some species at far-flung points between which they are, or at least appear to be, wanting. Sometimes there are no suitable habitats in the intermediate positions, sometimes the habitats are there but the plants are lacking, and all too often careful exploration has shown that the plants in question occur in intermediate situations after all—that the supposed disruption in their range was exaggerated or even non-existent. This is especially the case with diminutive plants and minor taxa that are easily overlooked.

Such range-disruption, whether actual or only supposed, has engendered some of the most active theorizing, and has stimulated much of the most

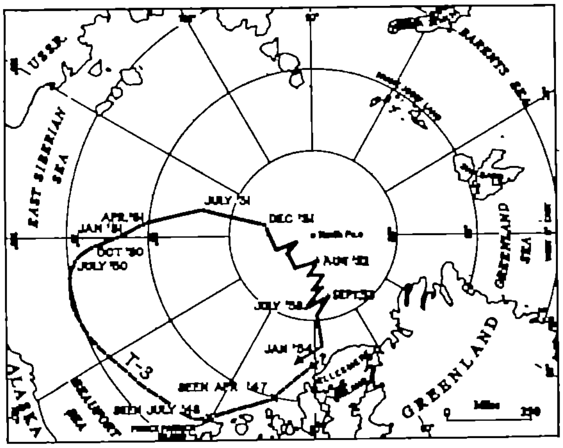

Fig. 1. Drifting of *T*-3 in the North Polar Basin

lively discussion, in all biogeography. It has been brought with particular force into arguments concerning such hypotheses as those of continental drift, perglacial persistence, and land-bridges. Indeed, there can scarcely be a major ocean that has not been hypothetically bridged by some enthusiastic biogeographer on the basis of the present-day disrupted range of the biota inhabiting its peripheral land-masses. To those who favour such hypotheses, long-distance dispersal is, of course, anathema, as it is apt to remove the very bases of their contentions.

Without denying the possible validity at some times and places of one or more of these hypotheses seeking to explain disrupted ranges in terms of 'historical' situations or events, it may be pointed out that our evidence for long-distance dispersal taking place in various regions and circumstances is mounting considerably in diversity and weight. Moreover, it should be remembered that the dispersal at any time of even a single disseminule of a hermaphrodite species to a new spot may, if it is followed by successful germination and ecesis, lead to the full establishment of the species at that new spot, which may in its turn become a centre for further colonization. Such 'saltatory' migrations over great distances of what are naturally pure strains may actually be the origin of the supposedly 'relict' populations 'depleted in biotypes' which advocates of persistence have called 'conservative'.

Whereas there are various ways in which plants are known to be dispersed in the Arctic, the case which has engendered the present communication is of a very special nature. In July 1953, Mr. A. P. Crary, of the Geophysics Research Directorate, Air Force Cambridge Research Center, found on the ice-island *T*-3 an almost flat, mat-like 'tussock' of moss about 24 cm. in diameter which he gave to me. Although dry and upside down when found, "lying near the edge of a melt stream on bare ice" (Crary *in litt.*), the tussock was greenish on its morphologically upper surface. It proved to be made up exclusively of the predominantly arctic species *Hygrohypnum polare* (Lindb.) Broth., being identified by Prof. William C. Steere, of Stanford University. Unlike all the other macroscopic botanical material collected on *T*-3, this specimen turned out to be alive[1]. Thus a portion of it, when moistened and kept under a bell-jar, soon lost its green colour and after ten days still gave no evident sign of life, being soggy and brown; yet after eighteen days the younger shoots were observed to be putting out tender laterals, and after less than four weeks the whole was a vivid green with new growth. It survived in this vegetative condition for several months, until the early summer of 1954, but then became lost in a move of my main laboratory from Harvard to Yale. Later attempts to revive other pieces of the same tussock have so far proved unavailing.

At the time when this moss was found, *T*-3 was floating in lat. 85° 41′ N. and long. 96° 20′ W., far out in the Polar Basin. So this seems to be much the most northerly collection of a living macroscopic plant ever made, being indeed from far north of the northernmost land in the world; and whereas it might be argued that its chances of ever reaching land, if it had been left alone, and of becoming re-established, would have been infinitesimally small, nevertheless they cannot be entirely ignored, having regard to the manner in which ice-islands are now known to float about the Arctic and, at least when smaller, even come so near to land that it is quite conceivable such a light and dry tussock might be blown back to effect migration. Thus, for example, it is computed that *T*-3 must have floated, ignoring minor lateral movements, at least some three thousand miles (4,800 km.) since becoming separated from the remaining shelf-ice of northernmost Ellesmere Island. There it apparently originated, and there the tussock of *Hygrohypnum polare* was presumably blown or washed from the land on to the adjacent shelf-ice before part of this last broke away to form *T*-3. It is even possible that the ice-island, and with it the moss, may have floated twice that distance around the Arctic Ocean since breaking loose—probably in 1936 or one of the ten subsequent years[2].

The possibility has been considered that this moss might have grown on *T*-3, for example from an air-borne spore which alighted on it when it was floating far out in the Arctic Ocean. But although moss spores are well known to be transported in the atmosphere to remote regions, and some protonemal growth has been observed on snow and ice[3], there is no evidence that development can proceed to leafy plants in such circumstances, much less reach the considerable dimensions of this specimen. Moreover, no macroscopic form of life has been found on the mixed morainic or dirt or other deposits on the island, and the crumbs of inorganic material enclosed

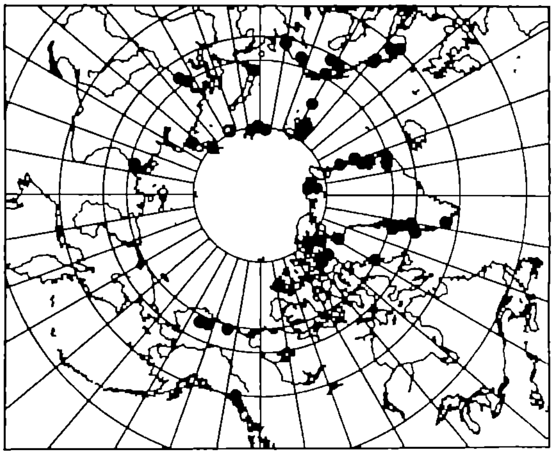

Fig. 2. Known geographical distribution of *Hygrohypnum polare* (Lindb.) Broth.

in the tussock appeared to be of alluvial origin, so there seem to be good reasons for discounting such a suggestion. Finally, Mr. A. P. Crary, who has lived for considerable periods on *T*-3, making all manner of scientific observations, considers it inconceivable that this moss tussock could have grown on *T*-3 or that it could have reached the island after its separation from the land. For, on one hand, on *T*-3 the temperature scarcely rises above 0° C. even in the warmest month and not even *small* growths of mosses are to be found, and, on the other, the jammed-up ice skirting the northernmost coasts commonly prevents a close approach to land and its roughness impedes travel of at all heavy objects by blowing. Nevertheless, other ice-islands—and this could in time apply to *T*-3—have been observed very close to land in the channels of the Canadian Arctic Archipelago[4], making it by no means inconceivable that this tussock of moss might ultimately have reached land and effected migration if it had been left alone and had remained viable.

Fig. 1 shows the presumed (broken line) and known (solid line) route of *T*-3 in the North Polar Basin since observations commenced in 1947, the 'July '53' spot in lat. 85° 41′ N. and long. 96° 20′ W. indicating where the living moss was gathered. Data for this sketch-map were kindly supplied by the Geophysics Research Directorate of the Air Force Cambridge Research Center. The known distribution of *Hygrohypnum polare* is shown in Fig. 2, prepared principally from data supplied by Dr. Steere and Mag. Kjeld Holmen, of Copenhagen, to both of whom warm acknowledgment is due. Whether or not the polar basin 'spot' should be added is a question rather for the philosophers of our subject to decide. At least they would not ignore the statisticians' contention that, even if the likelihood of some member of a population crossing a barrier is virtually nil in any one year, in the course of a million years such an event becomes probable, and in ten million years practically certain.

Work reported in this article has been sponsored by the Geophysics Research Directorate, Air Force Cambridge Research Center, under Contract *AF* 19(604)–1144, with the author as Project Director.

# EARTH TILTS IN THE BRITISH ISLES CONNECTED WITH FAR DISTANT EARTHQUAKES

By PROF. R. TOMASCHEK

The British Petroleum Company, Ltd., Research Centre, Kirklington Hall, near Newark, Notts

THE phenomenon of earthquakes being preceded by characteristic tilting movements of the ground in the same seismic region has been frequently observed[1]. In a recent paper Nishimura[2] has published observations on tilt movements in Japan which can be correlated with very far distant earthquakes. As such movements have also previously been observed in Europe[3] it seemed worth while investigating the possible existence of a world-wide influence of this type. This was readily possible as very sensitive tiltmeters have been in operation[4] in Winsford, Cheshire, since 1950, and records from them could be compared with all the cases given by Nishimura. The comparison shows generally a much steadier behaviour of the Earth's crust in Great Britain than in Japan. This is not merely an apparent effect due to the very stable position of the Winsford tiltmeters at a depth of 143 m. below surface (116 m. below sea-level) so that they are sheltered against the movements of the upper strata the tilts of which are known to be sometimes fairly large. Although many of the Japanese stations are situated at only shallow depths and some of the deeper stations are located in hills, so that they are above sea-level, there are several like Makimina (depth below surface 165 m.; below sea-level 35 m.), Bessi (750 m.; 90 m.), Ikuno (719 m.; 279 m.), Ogoya (300 m.; 90 m.), Hosokura (160 m.; 30 m.), which reach below sea-level. These stations show stronger general drift and tilt movements than are observed at Winsford, indicating that there exists a genuine difference in stability of the ground. It is therefore not surprising to find that most of the tilts connected with distant earthquakes, as observed in Japan at several stations simultaneously, have no characteristic corresponding tilt movements in Winsford, although the epicentric regions may be as different as Tibet, East Indies, Kuriles, Costa Rica. But a definite and extremely strong correspondence occurred on October 22, 1951 (Formosa earthquake).

The upper part of Fig. 1 shows the Winsford record of the north–south pendulum of August 17–19, 1952, containing among others the earthquake in Tibet (91·5° E., 30·5° N.), of magnitude 7 the tilt influence of which in Japan has been discussed by Nishimura. This record indicates that no special tilting was caused at Winsford, and it is an example of the normal behaviour of the tiltmeters showing only the tidal movements. The lower part of Fig. 1 shows the behaviour between $11^h$, October 21, 1951, and $9^h$, October 24, 1951. A heavy earthquake of magnitude 7 occurred in Formosa (122° E., 24° N.) at about $21^h34$ G.M.T. on October 21, 1951. In Japan (distance from the epicentre about 1,800 km.) special ground tilts of about 0·1 second of arc preceded the earthquake for about 20 hr. These tilts are not shown in the Winsford graphs, which are practically smooth (except for the tidal tilts) up to the first arrival of the earthquake movement. But a definite tilt is started by this earthquake, and this fairly steady tilt amounts to about 0·04 second of arc and lasts about 5 hr. after the first arrival of the earthquake. In Japan at the same time at Ikuno, Makinine, Ogoya and Kamigamo a heavy sudden tilt was observed which must have amounted to the order of seconds of arc. This is quite unusual even in the Japanese records and is not shown in any others published. In Winsford a slow, steady but very small tilt continues (partly due to tidal movements) up to about $20^h$, October 22. It is interrupted

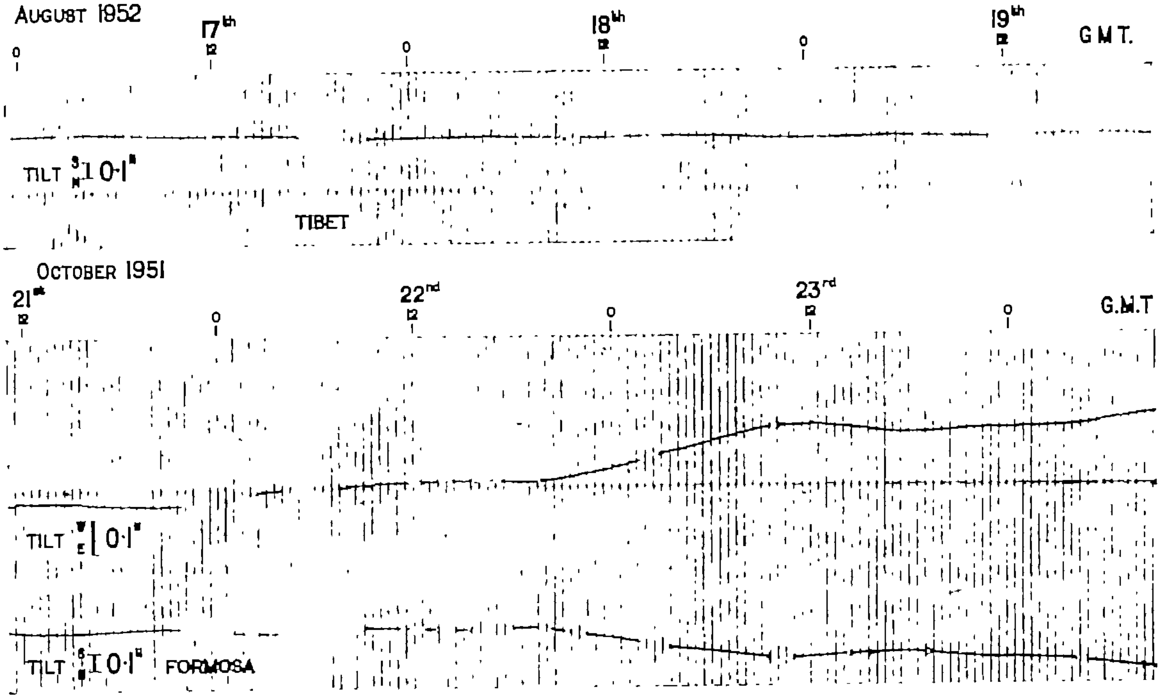

Fig. 1. Tilt records at Winsford, Cheshire

by several earthquakes which have no influence on this movement. Then, with an earthquake at about 20h, October 22, a strong tilt movement starts which lasts until about 9h30, October 23 (13½ hr.), and with an earthquake at this time the tilt movements slow down, but retain a certain drift for the next twenty-four hours. The total tilt within 36 hr. amounts to about 0·2 second of arc. In the Japanese records at Ikuno a progressive tilt very similar to the first short stronger tilt at Winsford can also be observed in one component. The tilt records taken by Dr. Doodson and the late R. H. Corkan at the Tidal Institute at Bidston also show the disturbance very clearly. (I should like to thank Dr. Doodson for showing me the Bidston records.) One has the impression that, initiated by the Formosa earthquake, a large world-wide readjustment of the Earth's crust must have taken place which was fairly rapid and strong in Japan and slower and later in Europe, and lasted here nearly 38 hr., showing even later after-effects.

That strong stresses accumulate in the Earth's crust at this time of the year has also been shown by previous experience[5]. The Winsford records show, furthermore, that a spectacular readjustment took place on October 24, 1950. The title of a lecture by Prof. Benioff[6]: "Evidence for World Strain Re-adjustment following the Kamtshatka Earthquake of November 4, 1952", seems to indicate the observation of a similar readjustment at very nearly the same date in autumn 1952.

These readjustments seem not to be connected with a considerable change in the distance of the masses from the centre of the Earth. No significant change in the rotational speed of the Earth (±0·1 thousandth of a second) was connected with the adjustment described in the present note (I thank Sir Harold Spencer Jones for this information).

However, the seasonal recurrence of these readjustments, which indicate the periodic accumulation of stresses in the mantle, shows that a certain connexion with the change of rotational speed of the Earth may exist in the following way. The annual change of rotational speed is due to meteorological factors on the Earth's surface, where the dislocation of masses (air, water, precipitation) takes place. The braking or accelerating effect of the change of moment of inertia has to be transferred to the deeper layers of the Earth. The transition of the Northern hemisphere from summer to winter condition puts, therefore, a heavy stress on these transferring layers. Its release might be observed in the readjustment mentioned above.

Another additive factor can be found in the direct action of the seasonal change of the temperature distribution over the northern hemisphere. It is surprising how deep into the earth these temperature influences penetrate in the form of stresses and strains, as shown by the solar semidiurnal and diurnal variations observed in the course of gravity and tilt measurements in deep mines, where temperature itself is constant in certain cases within a few thousandths of a degree. The change of temperature on a global scale[7] may add up to considerable strains in tectonically coherent areas. [Feb. 23

## Mechanical Properties of Degraded Gelatins

FRACTIONATION[1] of commercial gelatins has shown that the rigidity of gelatin gels is not solely dependent on the distribution of molecular weights but also depends on another factor—the 'rigidity factor'. Scatchard's results[2] show that the mean molecular weight of gelatin, and also its viscosity in aqueous solution, are decreased by thermal degradation. Ferry[3] measured the reduction in the rigidity of gels of these degraded gelatins, and related the changes to the molecular weights. The present investigation shows that while in certain conditions (for example, low *p*H) Ferry's assumption is correct, in other conditions (for example, neutral or high *p*H) the 'rigidity factor' is also reduced as degradation proceeds.

A lime-processed hide gelatin, isoionic point *p*H 5·05 (commercially characterized by its viscosity of 8·7 cp. in aqueous solution at 5·8 per cent w/w gelatin concentration and Bloom jelly strength, 225 *g*), was degraded in 5·8 per cent w/w solution at various temperatures and *p*H's for selected times. The viscosity of the 5·8 per cent solutions at *p*H 6·5 were measured at 40° C. and the rigidities[4] of the corresponding gels were measured at 0° C., after maturing for 18 hr. at 0° C. The results are illustrated in Fig. 1, where each curve represents constant degradation conditions (*p*H, temperature, etc.) and each point represents a given stage in the degradation.

The results may be summarized as follows. (1) At 90° C. and *p*H 5·5, both viscosity and rigidity decreased as the degradation proceeded, the rigidity tending rapidly to zero at the stage when the average molecular weight of the gelatin became too small to permit gel formation, corresponding approximately to a viscosity of 3 cp.; (2) at 60° C. and *p*H 11·2, the rigidity decreased more for a given fall in viscosity than in (1); (3) at 60° C. and *p*H 1·7, the rigidity actually increased slightly as the viscosity decreased, and then fell rapidly as the viscosity approached 3 cp.; (4) at 10° C. and *p*H > 13 in the gel form, the rigidity remained almost constant during the initial stages of degradation and then fell to zero.

These results suggest that for experiments (3) and (4) the 'rigidity factor' is unchanged. Only when a sufficient proportion of very short chains has been formed does the rigidity show a marked decrease. In contrast, the decreased rigidities for the degraded gelatins obtained in (1) and (2) may be explained by a reduction in 'rigidity factor' together with the effect of production of short chains especially in the latter stages.

Table 1

| Gelatin | Conditions of degradation<br>Temp. (° C.) | <br>*p*H | <br>Duration (hr.) | Rigidity* (in $10^4$ dynes/cm.$^2$) | 'Rigidity factor' (% of initial value) | Average logarithmic viscosity number (% of initial value) |
|---|---|---|---|---|---|---|
| *A* | Undegraded | | | 112 | 100 | 100 |
| *B* | 60 | 1·7 | 3 | 106 | 110 | 45 |
| *C* | 60 | 11·2 | 3 | 50·5 | 60 | 50 |
| *D* | 90 | 6·5 | 7·5 | 68·5 | 70 | 65 |
| *E* | 90 | 6·5 | 19 | 36 | 50 | 40 |
| *F* | 10 | >13 | 24 | 49·5 | 90 | 40 |

* 5·8 per cent gelatin concentration. Measured at 0° C. after maturing for 18 hr. at 0° C.

In order to investigate any change in the 'rigidity factor' during degradation, a number of degraded gelatins (Table 1) were fractionated by the alcohol[5] co-acervation method. The logarithmic viscosity numbers ($\frac{1}{c} \ln \frac{\eta}{\eta_0}$ at $c = 0\cdot002$ gm./ml.) of the fractions were measured[6] in molar NaCl at 40° C. and *p*H 6·5, and the rigidities of the 5·8 per cent gels of the fractions were measured at 0° C. In this way, certain fractions free of low-molecular weight non-gelling gelatin were obtained, which would show the effect of a change in 'rigidity factor' free from molecular weight complications.

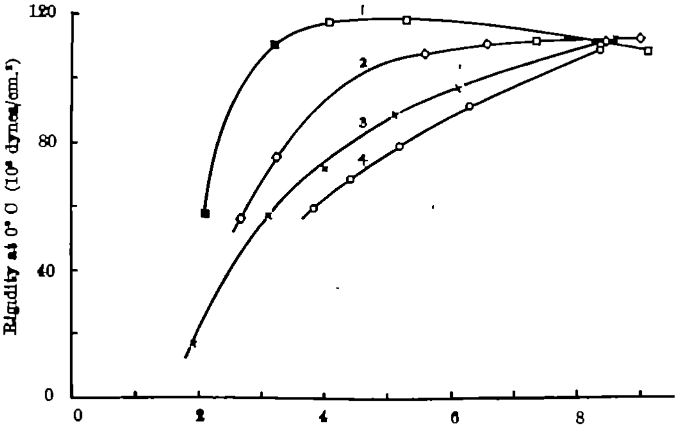

Fig. 1. Thermal degradation of a high-viscosity alkali-processed gelatin: (1) ⊡—⊡—, 60° C., *p*H 1·7; (2) ◈—◈—, 10° C., *p*H > 13; (3) ×—×—, 90° C., *p*H 5·5; (4) ○—○—, 60° C., *p*H 11·2

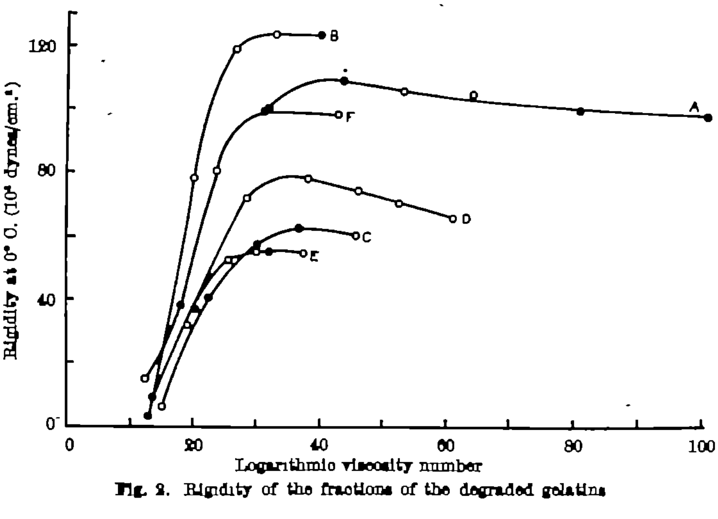

Fig. 2. Rigidity of the fractions of the degraded gelatins

The properties of the fractions of the degraded gelatins and of the original gelatin are shown in Fig. 2. The 'rigidity factors' of the degraded gelatins have been evaluated as a percentage of the undegraded values, by comparing the maximum values of rigidity on the rigidity – logarithmic viscosity number curves for the fractions.

Fig. 2 and Table 1 show clearly that, in neutral or alkaline conditions, not only is the average molecular weight of the gelatin reduced but also the 'rigidity factor' is seriously affected. In acid solutions, in contrast, there is even an apparent increase in 'rigidity factor'. This increase is not considered to be genuine, but to be related to limitations in the fractionation technique. Corrections for fraction homogeneity and degradation during fractionation reduce the discrepancy between the rigidities of the fractions of acid-degraded and undegraded gelatins of equal logarithmic viscosity numbers to zero within experimental error. A full account of this work will be published elsewhere.

## Ultra High-speed Skew-ray Tracing

Several electronic digital computors in Britain and the United States are now being used for tracing skew-rays through optical systems. The speed of calculation varies from machine to machine; but in general the fastest time is probably slightly less than ½ sec. per ray surface, while the slower machines require 1–2 sec. per ray surface.

Some work has been carried out recently using the new experimental Manchester *MK* II Machine (*MEG*) in this connexion. This machine has been programmed to trace single skew-rays through systems at a speed of 0·1 sec. per ray surface. The machine has been described in detail in two publications[1]. As the name implies, the machine has a pulse repetition-frequency of one megacycle, a speed faster by ten times than the Manchester *MK* I, which has already been used for optical work[2,3].

There is at present no magnetic storage for this machine, although provision has been made for this facility. The electronic storage consists of ten cathode-ray tubes operating in the parallel mode. Each tube stores 1,024 binary digits, so that the present full storage capacity is 1,024 ten-digit words. An important feature of this machine is that no attention need be paid to number-ranges, the arithmetical units having been arranged to perform floating-point arithmetic. In optical work this is a valuable feature, for systems of any focal length can be calculated as they stand, a facility which obviates the necessity, using fixed-point machines, for scaling systems up or down to a constant focal length.

All working routines must be stored in the electronic store, although it is possible to use punched tape as an auxiliary store, provided that the original input instructions are not written over. In this case, fresh orders can be read in from tape and the calculation can continue.

The placing of routines 'nose to tail' throughout the electronic store with the necessary alterations due to changes in position is carried out by an input routine due to R. A. Brooker. The method of skew-ray tracing described by me[3] has been strictly adhered to, and provision has been made for the extraction and summation of optical path differences, as it is proposed to use this programme for the evaluation of complete wave-front data.

At a ray-trace speed of 0·1 sec. per surface, it is possible to obtain a very full account of emergent wave-fronts at the exit pupils of systems in a quite reasonable time; and the examination of regions of stationary phase can be conducted in a time comparable with that required for the calculation of a few rays using conventional desk machines.

This work forms part of the programme of the British Scientific Instrument Research Association, carried out under contract to the Ministry of Supply.

## Determination of Elastic Constants of Solids by Ultrasonic Diffraction Methods

Elastic constants of a number of polycrystalline materials such as aluminium, silver, copper, steel, nickel, glass, zinc and brass have been determined using ultrasonic diffraction techniques. The results compare well with the values obtained by other methods.

The experimental arrangement consists of the usual Debye–Sears equipment for observing ultrasonic diffraction patterns. The material in the form of a thin plate, of which the elastic constants are to be determined, is placed in the cell interrupting the ultrasonic radiation from the quartz transducer. Rotation of the plate about the vertical axis causes total internal reflexion, and the transmitted wave disappears, which can be detected by the absence of diffraction pattern.

Since shear waves cannot be transmitted through a liquid, only longitudinal waves incident on the material are considered. When the longitudinal wave is incident in the normal direction, it is transmitted through the plate entirely as a longitudinal wave. As the angle is rotated from 90°, a point comes when there is no transmission of longitudinal waves. This is the first critical angle. As the plate continues to rotate, a second critical angle is obtained at which shear waves in the plate also cease to be transmitted. For points lying beyond this second critical angle there will be no transmission.

Snell's law for angular transmission gives:

$$\frac{\sin\theta}{V_L} = \frac{\sin\theta_L}{V'_L} = \frac{\sin\theta_S}{V'_S}$$

Table 1

| Material | Thickness (mm.) | $V'_L$ (m./sec.) | $V'_S$ (m./sec.) | $K$ | $\mu$ | $\rho$ | $F$ $\times 10^{11}$ dyne/cm.$^2$ | $E$ $\times 10^{11}$ dyne/cm.$^2$ |

## High-Pressure Glow-to-Arc Transitions with Tungsten and Copper Cathodes

FURTHER experiments on high-pressure glow-to-arc transitions using the technique described in a previous communication[1] indicate that, with both tungsten and copper cathodes, transitions may be initiated by either low ionization cathode impurities or surface irregularities. It has been found that a stable glow discharge may be operated in oxygen and on either thin or thick oxide layers provided the layers are smooth; but with the same experimental conditions the presence of an irregular oxide layer was found to cause transitions. Transitions were similarly obtained with unoxidized irregular surfaces and surfaces contaminated with irregular semi-conductor layers. In all cases the transitions were observed to take place at the points of irregularity. While it is clear, for example, from the work of Llewellyn Jones[2] and his collaborators, that enhanced emission is obtained from oxide surfaces, our work indicates that a more important factor affecting glow-to-arc transitions appears to be the presence of surface irregularities. An examination of the work of the many previous investigators who conclude that oxides or oxygen produce transitions shows that the transitions which they obtained may well have been produced by the presence of oxide irregularities rather than by the oxide itself. It may be concluded that such irregularities lead to an enhanced field and the consequent rapid formation of a field-emission arc.

It is of interest to consider the formation of arcs from glow discharges when the cathode is free both from surface impurities and irregularities. By careful polishing followed by prolonged cleaning of the cathode in a hydrogen discharge, experiments of this nature are possible. With tungsten electrodes in hydrogen at atmospheric pressure, it was found possible to obtain almost continuous glow-to-arc transitions with a range of electrode diameters from 1/32 in. to 1/8 in. As the diameter is increased, the current at which the transition begins (shown by the rapid fall in the voltage-current characteristic) also increases; but in all cases the overall cathode temperature was found to be ~ 1,800° C. at the commencement of the transition. This clearly indicates, in agreement with previous investigations, that the transition is explicable on the basis of the growth of cathode thermionic emission. A small discontinuity in the falling voltage-current characteristics was found to coincide with the sudden constriction of the discharge plasma into the bright red column normally associated with the hydrogen arc. This column transition is no doubt the cause of one of the transitions reported by Suits[3], although we have found no evidence of the further transitions which he reported.

In the case of a clean smooth copper cathode in hydrogen at atmospheric pressure when commencing with a glow discharge, increase in current caused a continuous concentration of the column until a final and sudden contraction took place, producing the bright red column observed with a tungsten cathode. This form of column has been noted previously by Fan[4] and Bruce[5], and its production may well be explained by the shape of the thermal conductivity curve as proposed by Hocker and Finkelnburg[6] and King[7] for the constriction of the carbon arc in air. Despite the formation of this constricted column, the cathode still possessed the normal negative glow and cathode dark space characteristic of a glow discharge. Attempts to increase the current further produced in some experiments a completely molten cathode surface with the production of cathode vapour bursts. Although the cathode surface was molten, the cathodic part of the discharge remained in the glow form. It appears, therefore, in contradiction to the work of Plesse[8] and others, that the presence of metal vapour at the cathode does not necessarily result in the formation of an arc. Further experiments at higher currents with the cathodes cooled to prevent melting produced uncontrolled discontinuous transitions. It may be that in these cases local melting and solidification take place with subsequent transitions at the points of irregularity thus produced. Should it be possible to avoid the formation of such irregularities, it is considered that an arc may well be finally formed on copper and mercury cathodes when the cathode current density is such as to produce field emission as calculated, for example, by Mackeown[9].

## Secondary Expansion of Perlite Concrete and Plaster

EXPANDED perlite, which is made by rapidly heating small particles of suitable volcanic glass, has recently been used extensively as a lightweight aggregate for gypsum plaster and concrete in the United States, and to a lesser extent in Australia and Europe. The phenomena described below are therefore of some concern to the building industry in those countries.

Unrestrained specimens of perlite plaster show at first a setting expansion followed by a short-term shrinkage, as does normal plaster. At an age of about three weeks, however, a relatively slow secondary expansion at a rate of about 0·1 per cent length increase per annum commences, and under normal atmospheric conditions this expansion continues at a slightly decreasing rate over a long period. The oldest specimens under test in this Division are still expanding at about half the initial rate after 600 days. Perlite concrete shows a similar, though much slower, expansion following an initial shrinkage period of some months[1].

Work which I have done indicates that a slow ion-exchange reaction is the cause of the secondary expansion. Expanded perlite is a glass which contains some exchangeable alkali and alkaline earth ions. In the presence of water, the main process which occurs is that hydrogen ions from the solution are exchanged with sodium ions, and to a lesser extent potassium and calcium ions from the glass. The rate of exchange for a given perlite depends, among other factors, upon the temperature and *p*H of the solution, being greatest at high temperature and low *p*H. Such exchanges taking place in perlite plaster and concrete lead to the formation in the matrix of alkaline hydroxides which may then react with carbon dioxide and moisture from the air, causing the matrix to expand. The quantity which may be exchanged is about 8 m.equiv. per 100 gm. after 60 days and is sufficient to account for the observed expansion. There is evidence that a further cause of the expansion in perlite plaster is the exchange of calcium ions in the plaster for sodium ions from the glass; the hydrated sodium sulphate which would form in the matrix has a greater volume than the gypsum it replaces. The rates of expansion of perlite plaster and concrete increase with increasing temperature, humidity and proportion of perlite in the mix, and vary considerably for different perlites.

Although some degree of control of expansion may be achieved in the laboratory, it appears that control in job conditions is impracticable. However, preliminary tests on restrained specimens of perlite plaster have shown that all but a small part of the stress caused by expansion is relieved by internal creep. The secondary expansion is therefore not likely to cause failure of perlite plaster provided the rate of expansion of unrestrained specimens at 70° F. and 60 per cent relative humidity is less than 0·1 per cent per annum, and provided suitable construction methods are used. Similar considerations apply to the use of perlite concrete, in which the expansion is usually more than offset by the high initial shrinkage.

A more detailed account of this work is to be published at a later date.

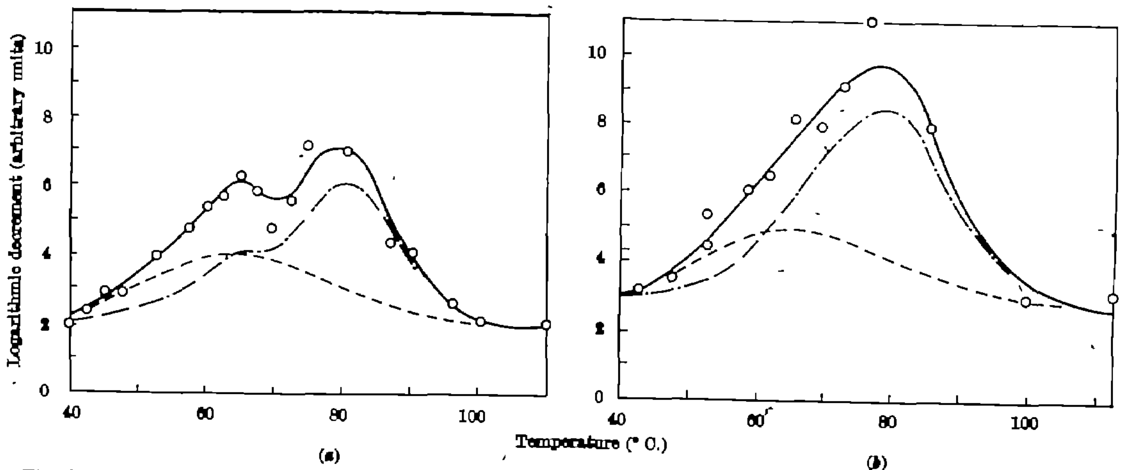
## Condition of Boron in Alpha Iron

THE question as to whether boron forms an interstitial or a substitutional solid solution in α-iron is of considerable theoretical and practical interest. Recently measurements have been made, by orthodox methods, of the solubility and diffusivity of boron in both α- and γ-iron[1-3]. These gave the maximum solubility of boron in α-iron as about 0·008 weight per cent at 900° C. The data on the diffusion in α-iron[4] were not precise but indicated an activation energy of 62 kcal. per mole and a $D_0$ of $10^{4}$ cm.$^{2}$ sec.$^{-1}$. This suggests that boron behaves substitutionally. Some calculations based on estimates of the atomic radius of boron[5] also suggest that boron may be substitutional in α-iron. However, we felt that this evidence was somewhat speculative and not sufficiently conclusive. Obviously, if boron were interstitial, it should be possible to observe an internal friction peak similar to that caused by carbon and nitrogen in α-iron[5,6]. The purpose of the present communication is to describe some exploratory measurements on internal friction which suggest that boron is in interstitial solution in α-iron.

The internal friction technique has been described in detail elsewhere[7]. Essentially a wire specimen forms the torsional suspension of a freely oscillating system. When the logarithmic decrement is plotted against temperature of measurement, the presence of an interstitial solute gives rise to a peak in the curve. The diffusion coefficient is calculated from the frequency of vibration for the temperature at which the peak occurs. The height of the peak is proportional to the amount of interstitial solute in free solution.



(a) (b)

Fig. 1. (a) Specimen quenched from 700° C. Frequency of vibration 15·5 per sec.; (b) specimen quenched from 900° C. Frequency of vibration 14 per sec. 1 unit of logarithmic decrement is approximately equivalent to 0·001 weight per cent carbon. ———, Experimental curve; – – –, relaxation peak due to 0·002 weight per cent carbon; — . —, difference between observed curve and carbon peak

Internal friction peaks have now been observed in specimens containing boron (Fig. 1). Specimens were produced in the following way. Pure iron wires (0·04 and 0·08 in. diameter) were decarburized and denitrided in flowing wet hydrogen (about seven days at 800° C.). Boron was introduced by annealing the wires, with powdered boron, in an atmosphere of dry hydrogen at 1,000° C. in a closed system. The purest boron that could be obtained contained about 1 per cent carbon. The resulting specimens contained (weight per cent) about 0·05 boron, 0·002 carbon and 0·001 nitrogen (by chemical analysis). Consequently, the only possible controversial point in ascribing the peaks of Fig. 1 to interstitial boron is the fact that carbon was also present in the specimens.

Previous work with wire specimens of similar texture to that used in this investigation gave the proportionality constant between peak height and carbon content in solution. In Fig. 1 one unit of logarithmic decrement is roughly equivalent to 0·001 weight per cent carbon. The curves in Fig. 1 represent specimens quenched from 700° and 900° C. The latter peak height is greater than that for 0·002 weight per cent. It is also at a temperature higher than that corresponding to the peak for carbon, for a frequency of vibration of 14 c./s. Experimental error is greatest at high levels of damping. The curve in Fig. 1b has been drawn purposely below the highest observed point because of this. The resultant component curves are then of the form to be expected from theoretical calculation. The specimen quenched from 700° C. gave two resolved peaks corresponding in height to about 0·002 carbon and 0·004 boron (weight per cent). The lower temperature peak corresponds, for the frequency of vibration, to that for carbon[4]. The higher-temperature peak must thus correspond to interstitial boron. A relaxation peak due to substitutional boron would not be observed for such a low concentration of boron, nor at such a low temperature.

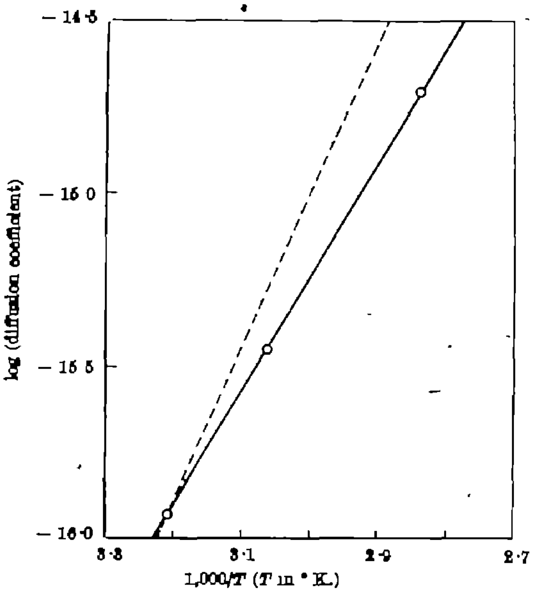


Fig. 2. Variation of diffusion coefficient with temperature. ———, Boron; – – –, carbon

Two further points arise from this present exploratory work. Assuming that the proportionality constant between peak height and boron content is the same as that for carbon, the solubility of boron in α-iron can be determined. This solubility is that in equilibrium with precipitated iron boride, presumably $Fe_2B$. At 900° C. it is 0·005 weight per cent and at 700° C. about 0·004 weight per cent. The assumption is probably untrue; it is more likely that boron strains the iron lattice to a greater extent than does carbon. This would lead to a bigger proportionality constant, and consequently the boron solubility will be less than quoted above.

Secondly, an estimate can be made of the diffusion coefficient, $D$, of boron in α-iron,

$$D = \frac{a^2 \omega}{36}$$

where $a$ is the lattice parameter of α-iron and $\omega$ the angular frequency of vibration.

Measurements carried out at various frequencies are reported in Table 1 and plotted in Fig. 2 in the form $-\log D$ versus $1/T$, where $T$ is the absolute

Table 1

| Frequency of oscillation (sec.$^{-1}$) | Temperature of peak (° C.) | Diffusion coefficient $\times 10^{16}$ cm.$^2$ sec.$^{-1}$ |
|---|---|---|
| 0·8 | 39 | 1·18 |
| 2·5 | 54 | 3·55 |
| 14 | 79 | 20 |

temperature at which the internal friction peak occurs.

The corresponding curve for carbon is also plotted in Fig. 2. In view of the results of Fig. 1, however, the evidence for considering boron to constitute an interstitial solid solution is considered satisfactory. The activation energy for diffusion, estimated from Fig. 2, is 15 kcal. per mole, with a $D_0$ of about $10^{-3}$ cm.$^2$ sec.$^{-1}$. It is not proposed, at this stage, to discuss the differences between the present results and those of previous workers. A more complete report will be given elsewhere.

## Bed-width and Wave-length in Meandering Valleys

IN a previous communication[1] it was stated that the alluvium of six winding valleys occupies large channels which meander around the valley bends. Subsequent work in other valleys has provided similar evidence[2], and confirms the view that the valleys were eroded by streams larger than those which now flow in them.

When the width of the alluvium-filled channels is plotted against the size of the drainage basins, it is clear that a relationship exists. A connexion is also observed between the size of catchment and the wave-length of valley meanders (Fig. 1). Equations of best fit have been calculated both for width of channel and for wave-length of meander, with the following results:

$$W = 43\,M^{0.43}$$
$$L = 560\,M^{0.43},$$

where $W$ and $L$ are respectively the minimum width of the filled channel and the wave-length of valley meanders, in feet, and $M$ is the size of catchment in square miles. The close interdependence of the three variables is further illustrated in Fig. 2. The coefficient of correlation between $W$ and $M$ is $+0{\cdot}791 \pm 0{\cdot}067$, while that between $L$ and $M$ is $+0{\cdot}856 \pm 0{\cdot}048$.

The closeness of the connexions is all the more impressive in view of the natural irregularities of development both of the channels and of the valley meanders. The channels are laterally enlarged at bends, and for this reason measurements were taken at the points of inflexion where lateral cutting has been at a minimum and the channel width is least. The effects of distortion of meanders during incision, with or without shift downstream, has been partly offset by taking as a value for wave-length the mean wave-length of a series of bends, some upstream and some downstream of the point at which the channel width was measured.

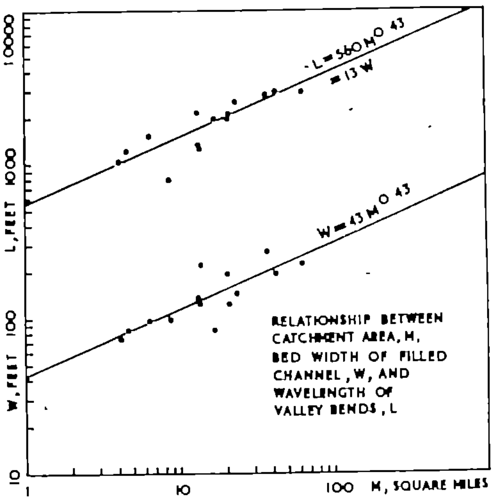

Fig. 1

It is known that the channels of natural meandering streams are shaped at bank-full discharge conditions. It has also been shown that the dimensions of meanders depend mainly on discharge[3], and that discharge is the principal control of bed-width in natural streams[4]. It follows therefore that, when the valley meanders and large channels now under discussion were being cut, bank-full discharge varied proportionally to catchment area. The circumstance is not surprising, since the catchments dealt with are all small (see Table 1). Even to-day, heavy rainfall or the melting of snow is rapidly followed by a swiftly increasing discharge.

The twelve basins represent a considerable range of hydrographic environments and of relations to former glacial and periglacial conditions. Some of them have been reduced in size, either by river capture or by-divide migration, within the Pleistocene. In view of these facts the inferred connexion between size of catchment and amount of former discharge is all the more impressive. It is evident from the contrast in size between the present stream beds and the filled channels, and between the present river meanders and the valley meanders, that all the

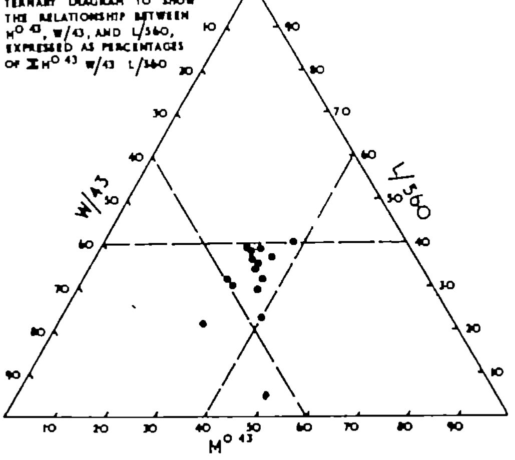

Fig. 2

Table 1. VALLEYS MEASURED

| River | Size of catchment above measured section of channel (sq. miles) |
|---|---|
| *Thames Basin* | |
| Cherwell | 12·3 |

| *Sussex Arun Basin* | |
| Dunsfold Brook | 37·0 |
| Kirdford Brook | 20·8 |

streams have suffered a marked reduction of discharge at bank-full stage. The analysis of the results indicates that the reduction has taken place within the limits of the basins as at present defined. River capture is seen to be irrelevant to the question of stream shrinkage. The problem is one of changes in the rate or amount of precipitation, or in both, and possibly also of high surface-discharge from melting snow. This conclusion, already reached on other grounds, is amply supported by the figures analysed here.

## New Zealand Crustal Structure

A SEISMIC refraction profile 170 km. in length has been recorded in the Wellington Province of the North Island by officers of the Geophysics Division, N.Z. Department of Scientific and Industrial Research. The shot point and all recording stations were sited on basement greywacke. A formal solution of the results shows four layers with thicknesses of 0·6, 1·7, 7·2 and 8·8 km. in which the velocities of longitudinal waves are $3{\cdot}5_0$, $5{\cdot}5_2$, $6{\cdot}0_7$ and $6{\cdot}2_3$ km./sec. respectively. The Mohorovičić discontinuity is at a depth of slightly more than 18 km., and the velocity below it is $8{\cdot}0_3$ km./sec. No reverse shot was possible, and gravity data indicate that the discontinuity may be slightly deeper at the northern end. The true velocities could therefore be a little greater than those given by the formal solution. The Mohorovičić discontinuity and possibly the $6{\cdot}0_7/6{\cdot}2_3$ boundary are confirmed by reflexions.

The 3·5 km./sec. velocity is not considered to indicate a separate layer, but to represent the weathered and shattered upper portion of the greywacke with which the 5·5 km./sec. velocity is associated. There is probably no sharp transition between these 'layers'. The earlier conclusion of Bullen[1] from earthquake studies that the 'granitic' layer is thin or absent in New Zealand is not accepted, since the 6·0 km./sec. velocity is that conventionally assigned to this layer. Bullen's results can be reinterpreted to conform with this view. It is uncertain whether the velocity of 6·2 km./sec. is high enough to allow the associated layer to be identified as 'intermediate'.

A detailed account of the observations and discussion of the results will be published later this year as a Memoir of the Geophysics Division of this Department.

## The Nocturnal Heat Balance

IT is implicit, in the generally accepted theory of the heat balance on clear nights[1-3] that the cooling of the air near the ground is a direct consequence of heat loss to the surface by convection and conduction; ultimately the latter. However, Ramdas and Atmanathan[4] have shown that, in India, under very stable atmospheric conditions, the lowest air temperature is not reached at the surface but at some height above it. This observation is inconsistent with the classical theory. The phenomenon has been observed by workers in other places, notably Brawand and Kohnke[5] in Indiana, and Jenny[6] in Lausanne; but apparently its theoretical implications have not been appreciated. Ramanathan and Ramdas[7], and more recently Rider and Robinson[8], have suggested that under stable conditions certain air layers near the ground may be in radiative rather than conductive equilibrium with their surroundings, the eddy conductivity approaching the molecular value. Sutton[9] and others have stated that the part of the atmosphere mainly concerned in nocturnal radiation exchange is a relatively thin layer near the ground. Now if this layer is considered to be at the same initial temperature as the surface it must be a net radiative loser of heat, and will therefore tend to cool to a temperature below that of the surface; a process more or less retarded by heat gained by convection and conduction from the ground and from the upper air layers. On the basis of this theory, the temperature reached by the surface continues to play an important part in determining that reached by the air near it, but for reasons quite different from those given in the classical theory.

The present investigation confirms the observation of Ramdas[4]. Fig. 1 shows the temperature profile observed over the centre of a thirteen-acre field of entirely bare soil. The temperature of the 'surface' was obtained by taking the mean reading of two spirit-in-glass minimum thermometers resting upon it. It is inconceivable, especially in view of Robinson's observations[8], that the temperature indicated could have been greater than the effective surface temperature under these conditions. The other temperatures were measured with a single type *U* 2361 thermistor, of diameter about 0·01 in., without aspiration or screening. So small an element indicates closely the behaviour of the air temperature. Moreover, the observed profiles could not be adequately explained in terms of errors due to radiation, evaporation or thermal lag, even if these were appreciable. The shape of the profile was confirmed qualitatively by observations with pairs of fully exposed minimum thermometers. A sensitive wind-direction recorder (vane-centre at 14 in. above the surface) remained

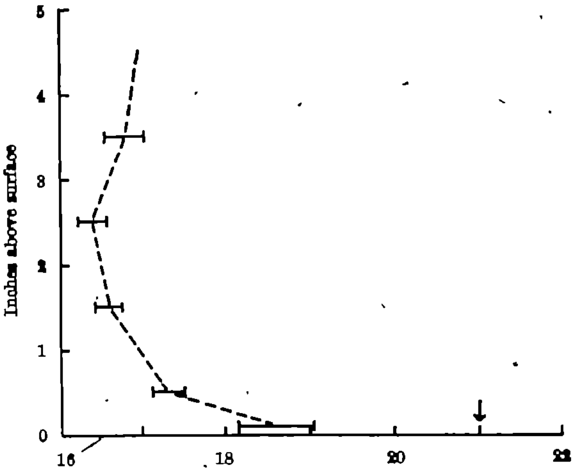

Fig. 1. Mean temperature profile on March 22 for the period 05.42–06.11 G.M.T. (before local sunrise). Sky entirely clear. The mean temperature at 54 in. was 18·4° F. Standard deviations (52 observations) indicated by ⊢⊣. Arrow indicates surface temperature

practically motionless throughout the half-hour period of observation.

From these results, and from similar observations made on the two preceding nights, the following conclusions were drawn: (1) the lowest temperature occurred at about 2·5 in. above the surface; (2) the profile of standard deviation of temperature fluctuations about the mean showed a minimum value at about the same level; (3) the negative difference between the surface temperature and that at any height up to 54 in. increased with time, so long as conditions remained stable.

The curious density distribution indicated by this profile has already been noted by Ramanathan and Ramdas[7], and conclusion (2) above supports their view that at the level of the lowest temperature heat exchange must be at a minimum.

Although on less-stable nights the discontinuity in the temperature profile may well disappear, direct radiation loss from the air will presumably continue to be of considerable importance in determining the temperature distribution. This result may be of both theoretical and practical interest, particularly in relation to the frost problem, and a fuller discussion, together with a description of the experimental methods used, will be published elsewhere.

## Accuracy and Reproducibility of Paper Protein Electrophoresis

THE analysis of the protein composition of blood serum or plasma by means of zone electrophoresis on filter paper has stimulated interest in clinical laboratories throughout the world. In addition to numerous publications dealing with the applications of the technique in various pathological conditions, critical assessments of its validity and accuracy have appeared[1–4], in which attention is properly directed to the limitations of the method from the point of view of the numerical evaluation of the separated protein fractions. It has seemed desirable to undertake a study of the accuracy and reproducibility of this method of protein analysis, using two of the most commonly employed protein-dyeing techniques.

Protein-free plasma was obtained by heating pooled human plasma in a boiling water-bath for 30 min., and then centrifuging at 3,000 r.p.m. for 2 hr. In this solution, bovine serum albumin (Armour), and bovine globulin (Armour—Fraction V) were dissolved to a concentration of 6 gm. protein per 100 ml. in each case. These stock solutions were diluted with protein-free plasma to give a final concentration of 4 gm. and 2 gm. of albumin and globulin respectively, and then mixed in the proportions shown in Table 1. The mixtures were applied to strips of Whatman No. 1 filter paper in a modification of the method described by Hardwicke[4]. The estimations were carried out in duplicate. 2·5 mm.$^3$ of solution was applied to each of five spots along a line at right-angles to the axis of the paper strips and 6 cm. from one end.

Table 1

| Protein conc. (gm./100 ml.) | Albumin – globulin ratio in mixture | Ratios obtained by electrophoresis | | | |
|---|---|---|---|---|---|
| | | Naphthalene black 12 *B* | | Bromphenol blue | |
| | | Albumin – globulin ratio duplicate | | Albumin – globulin ratio duplicate | |
| 2 | 1 | 1·1 | 1·2 | 1·04 | 0·82 |
| 2 | 3 | 2·3 | 2·2 | 1·1 | 2 |
| 2 | 0·33 | 0·23 | 0·14 | — | — |
| 4 | 1 | 0·94 | 1 | 1·06 | 1·3 |
| 4 | 3 | 2·6 | 2·7 | 2·9 | 3·4 |
| 4 | 0·33 | 0·38 | 0·43 | 0·35 | 0·43 |
| 6 | 1 | 1·15 | 1·25 | 0·96 | 0·79 |
| 6 | 3 | 3·3 | 3 | 1·85 | 1·63 |
| 6 | 0·33 | 0·51 | 0·64 | 0·42 | 0·57 |

Electrophoresis was carried out by the method of Grassmann *et al.*[5] using veronal–acetate buffer *p*H 8·6, $\mu$, $\mu = 0·05$. The serum-bearing end of the paper was placed at the cathode side of the tank and migration was permitted to continue for 16 hr. at 110 volts.

After drying rapidly in a hot-air oven at 125° C., representative strips were dyed, either for 10 min. in saturated naphthalene black 12*B* in methyl alcohol containing 10 per cent glacial acetic acid; or for 30 min. in 0·1 per cent bromphenol blue in absolute alcohol saturated with mercuric chloride. To avoid uneven dyeing due to air bubbles in the paper strips, it was found necessary to do this in an evacuated desiccator. The strips dyed in naphthalene black 12*B* were washed in 90 per cent methanol – 10 per cent glacial acetic acid until elution of dye had almost ceased, and then in 60 per cent methanol – 6·6 per cent water, 1·2 per cent glacial acetic acid and 0·2 per cent normal hydrochloric acid, until elution was complete. Strips dyed in bromphenol blue were

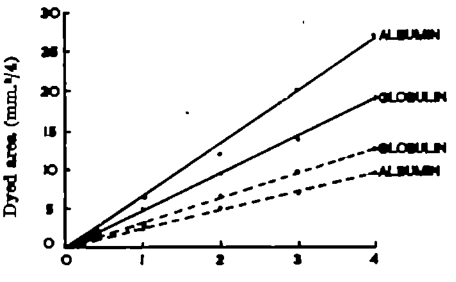

Fig. 1. Relationship between intensity of dyeing and protein concentration. — — — —, bromphenol blue; ———, naphthalene black

washed for 40 min. in four changes of 0·5 per cent acetic acid in water, followed by rinsing in dioxan and ether.

Evaluation of the strips was carried out using the strip densitometer manufactured by Messrs. Bender and Hobein, Munich, the strips being rendered translucent by immersion in a mixture of liquid paraffin and α-bromonaphthalene (6 : 1). Densitometer readings, made at 1-mm. intervals along the strips, were plotted graphically to produce a curve in which each peak corresponded to a protein component. The peaks were drawn as Gaussian curves and the areas beneath the curves measured by planimeter. In order to establish a direct relationship between the areas so measured and the protein concentration on the paper, stepwise increases in concentration of albumin and globulin applied as bands to paper strips were dyed as described, but without preliminary electrophoresis, and evaluated. The results are shown graphically in Fig. 1 and illustrate the rectilinear relationship between dyed area and protein concentration for albumin and globulin for both dye substances used. These findings have been confirmed by D. J. R. Laurence (personal communication). Also shown by Fig. 1 is the difference between the dye-binding capacity of albumin and globulin for both dye substances, together with the considerable reduction in dyeing intensity achieved with bromphenol blue.

The albumin to globulin ratios determined after electrophoresis are shown in Table 1, and from these results the following conclusions may be drawn:

(*a*) Using this particular technique, the concentration of the applied protein solution must be of such an order that the concentration of the minor component, particularly where this is albumin, is adequate to prevent significant loss or reduction by 'tailing', while the concentration of the major component is below that at which understaining or 'packing' is liable to occur[4]. Using bromphenol blue and employing an elution technique, Hardwicke[4] found that the relationship between protein concentration and optical density was lost if the concentration of any one fraction exceeded 1·0 gm. per 100 ml., whereas Martin and Franglen[1], on the basis of a scanning technique and using bromcresol green as dye solution, found that the uptake of dye by unit area of protein varied directly with protein concentration only when that concentration lay between 2 and 3 gm. per 100 ml. In the present experiment a total concentration of 4 gm. per 100 ml. was found to be optimal for accuracy and reproducibility for both the dyes investigated, thus giving a maximum component concentration of 3 gm. per 100 ml. and a minimum component concentration of 1 gm. per 100 ml.

(*b*) When used under the above conditions, and at all concentrations of protein, naphthalene black gives the more correct and reproducible evaluation of protein composition.

(*c*) With either dye, and using the optimum protein concentration, recovery of the protein fractions is only possible to within about ± 5 per cent, and while such a degree of accuracy is not impressive, it is adequate when used as an aid to clinical diagnosis. Such use with pathological sera or plasma will involve an evaluation of the minor globulin components, where concentration must inevitably fall below the optimum necessary for accuracy, and thus small numerical variations must not be regarded as being unduly significant.

## Mode of Action of *iso*Nicotinic Hydrazide

The high specific activity of *iso*nicotinic hydrazide (isoniazid; I) against *Myco. tuberculosis* suggests interference with an essential metabolite.

It is known[1] that hydrazides form stable complexes with copper. The structures (II*a* and II*b*) have been suggested[2,3] for the copper complex of (I), and the anti-tuberculous activity of isoniazid has been attributed[4], without direct experimental evidence, to the ability of the hydrazide structure (—CO—NH—N=) to form such copper (or iron) complexes. We have now obtained the following evidence relevant to this problem:

(i) Formation of the copper complex of (I) is accompanied by a marked fall in *p*H, due to the reaction of isoniazid in the tautomeric enolic form, via salt formation of the pseudo-acid (III), to give the complex (II*a* or II*b*).

(ii) Schiff's bases of type (IV) have activity equal to that of isoniazid itself[5], and have been found to form copper complexes of type (II) also.

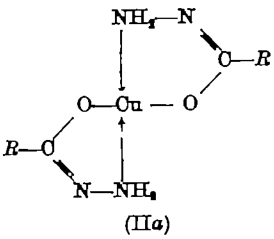
(iii) Alkyl derivatives of isoniazid of type (V) are also able to form copper complexes of type (II), and have been shown[5] to retain, either wholly or partially, the activity of the parent compound.

(iv) It is therefore clear that the ability to form chelate complexes of type (II) depends on the asterisked hydrogen atom in (I), and that substitution of this hydrogen, for example by methyl, will produce compounds unable to form such complexes.

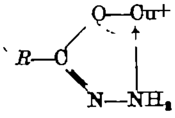
We have now prepared three such compounds: 1-*iso*nicotinoyl-1-methylhydrazine (VI) and two Schiff's bases of type (VII). These three compounds give, with cupric ion, neither a colour change nor a precipitate. When tested against *Myco. tuberculosis* H37*Rv. in vitro* by the technique previously described[6], side by side with their analogues of structure (IV) and with isoniazid itself, it was found that whereas (I) and (IV) were highly active (this activity is specific for *Myco. tuberculosis*), the corresponding methyl-

$R—CO—NH^{*}—NH_2$
(I)

$R—C(OH)=N—NH_2$
(III)



(IIa)



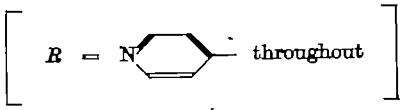
(IIb)

$R—CO—NH—N=CR'R''$
(IV)

$R—CO—NH—NHR'$
(V)

$R—CO—NCH_3—NH_2$
(VI)

$R—CO—NCH_3—N=CR'R''$
(VII)



substituted compounds (VI and VII) were, by comparison, inactive (Table 1).

Experimental evidence is thus presented that the anti-tuberculous action of isoniazid compounds may be correlated with their ability to form chelate complexes of type (II), and that inability to form such complexes results in disappearance of activity. The action of isoniazid therefore appears to include an essential chelation step.

In view of the fact that the anti-tuberculous action of isoniazid is inhibited by pyridoxal, pyridoxine and pyridoxamine[7], and by α-ketoglutarate and pyruvate[7], it is possible that the metabolic block caused by the isoniazid–metal complex involves interference with transamination, a reaction catalysed by pyridoxal in the presence of heavy metal ions. It is worth noting that the postulated complex formed from pyridoxal, amino-acid and cupric ion[8] bears a marked resemblance to the metal–isoniazid complex (IIa).

Further work on this problem is in progress, and full details will be published elsewhere. We wish to thank the National Health and Medical Research Council and the Rockefeller Foundation for partial financial support.

Table 1. TUBERCULOSTATIC ACTIVITY IN SERUM–SYNTHETIC MEDIUM

## Liberation of Amino-Acids by Oat Seedlings

IN a recent communication[1], the excretion of amino-acids by roots in relation to desiccation was discussed, and an indication given that plants grown under sterile conditions excreted ninhydrin-positive substances from their roots. In view of the importance of such root exudates in rhizosphere microbiology, the following preliminary report on the excretion of amino-acids by oat seedlings grown under sterile conditions may be of interest.

The method of obtaining material exuded by oat seedlings was by means of a perfusing system (a modification of the Lees–Quastel perfusion apparatus[2] was utilized). Surface-sterilized oat grains were placed on the surface of a column of sterile sand which could be irrigated with a sterile inorganic mineral nutrient solution (the total volume of perfusate being initially 150 ml.). The perfusion system was a closed one, sterile air being pumped into the system to effect perfusion of the sand column. Regular tests on the perfusate were made to check the sterility of this liquid. Sterility tests were effected by drawing off 1-ml. samples of the perfusate at four-day intervals, incorporating such samples with cooled molten Czapek–Dox agar (at pH 7), which was then dispensed into Petri dishes. The plates, thus prepared, were incubated and observed daily for the development of micro-organisms, the development of which would indicate a loss of sterility by the perfusing system.

Rapid germination of the oat grain ensured the formation of a dense root mass in the sand column. Perfusion was effected for three half-hour periods daily until the seedlings were twenty-eight days old. The perfusate was then collected and concentrated *in vacuo*, the residue being taken up in 5 ml. alcohol. This resulting solution was utilized (*a*) for colorimetric tests for the presence of amino-acids, and (*b*) for the chromatographic analysis of the amino-acids present.

A positive colorimetric reaction for amino-acids was given, and the chromatographic analysis demonstrated the presence of several amino-acids in the exudate preparation, among which cystine, glycine, alanine and aspartic acid have been identified.

Tests on concentrated perfusates from sterile sand columns in which no oats were grown showed no amino-acids present.

With the results given here, it is not possible to ascertain the relative roles of the grain and the roots in the excretion of amino-acids into the growing-medium; investigations are in progress to attempt to elucidate this. The work is being carried out as part of a study on the metabolism of soil micro-fungi with particular reference to forms inhabiting the rhizosphere and root surface.

## Action of Ribonuclease on Two Solid Tumours *in vivo*

THE effects of ribonuclease on ascites tumours have been described recently[1]. The present communication gives preliminary results obtained on two solid tumours, namely, the spontaneous mammary tumour in *C3H* or *C*+ mice and the Crocker 180 sarcoma in *C*+ mice.

The enzyme used in these experiments was the commercial product produced by Armour from beef pancreas (the preparations used were sterilized by Seitz filtration). It has been mentioned elsewhere[2] that this enzyme preparation differed in some respects from that described in the literature[3,4] and from other commercial sources. It may suffice to state here that the Armour product as used contained about 25–30 per cent of fully active ribonuclease, the remaining 70–75 per cent being inactive ribonuclease and material of low molecular weight. The results obtained with the ascites tumours gave an indication that the inactive portion of the enzyme preparation could, to some extent, inhibit the action of the active one. It is suggested, therefore, that the results obtained on solid tumours represent thus a minimum effect with the concentrations used.

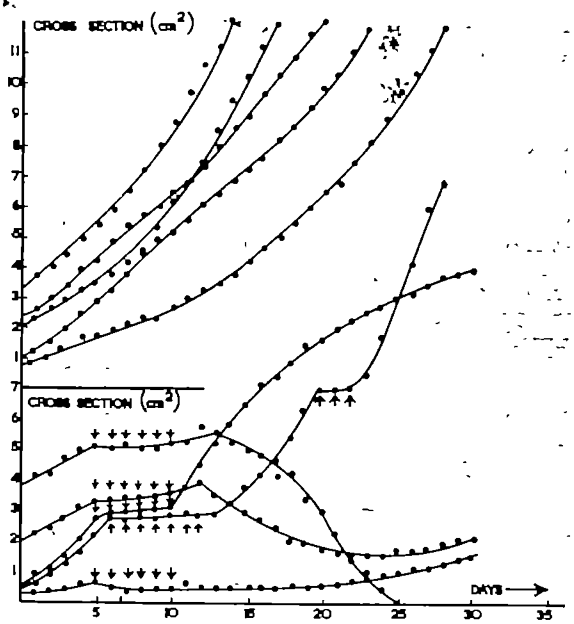

Fig. 2. Sarcoma 180. Treated animals received daily injections of: ↓ 25 mgm. ribonuclease, or † 12 mgm. ribonuclease, dissolved in 0·5 ml. saline. Controls were injected with equal volumes of saline

Fig. 1 shows the growth-curves of untreated and treated spontaneous mammary tumours in *C3H* or *C*+ mice. The size of the tumours was estimated either directly on the animal by measuring two perpendicular diameters and using their product as an expression of the size of their cross-section, or by determining with a planimeter the area of the tumours on photographs taken under standard conditions. This estimation was carried out daily for a period of seven to fifteen days prior to the commencement of the treatment, and this initial curve can serve as an additive control of the effects achieved. Controls were selected from animals showing approximately the same growth-rate as the treated ones, and while the enzyme preparation was administered to the latter by intraperitoneal or subcutaneous injections (*I* and *S* respectively on the graph) the former were given injections of saline solutions. This would exclude the possibility of injection effects in the treated series.

The mammary tumours used are known to regress spontaneously only very rarely[5], and although not always giving the same results in certain cases[6], they are certainly among the most resistant tumours to any drug used. In consequence, the effect of the treatment by ribonuclease as shown in Fig. 1 appears to be really significant: in a number of treated animals, regression occurs, and in

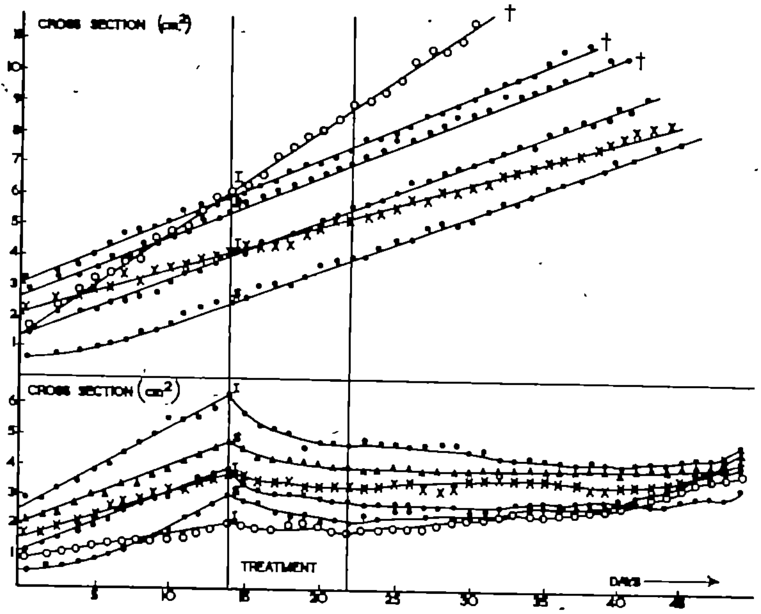

Fig. 1. Spontaneous mammary carcinoma. Treated animals received daily injections of 25 mgm. of ribonuclease dissolved in 0·5 ml. saline. Controls received daily injections of saline (0·5 ml.)

ll of them the growth of the tumour was arrested hile the treatment lasted. The regression in ize of the tumours is a transient one with the doses sed; but it lasts for some time after the treatnent has ceased. It should be emphasized that he doses used are probably not optimal ones. n fact, it was impossible to establish any toxicityevels of ribonuclease at doses up to 200 mgm./nouse. The only side-effect of the enzyme preparaion seems to be loss of hair. The hair starts falling out a few weeks after the beginning of the injections, but grows again when tumour-growth recommences; otherwise, the animals continue to take their food normally.

In Fig. 2, the results obtained on animals with sarcoma 180 (Crocker) are given. In this case, ribonuclease was administered by intraperitoneal injections only. The animals for this experiment were selected from the best of a group with implantations. In each of the animals the growth of the tumour was inhibited during treatment but continued after the cessation of the injections. In some animals a regression was noticed, and in one animal the tumour disappeared. However, none of the control animals showed any regression in tumour growth. In treated animals in which regression was observed, this was usually accompanied by necrosis of the tumour, not observed in the control series.

These preliminary results clearly reveal that ribonuclease can influence the growth of certain solid tumours, and they also indicate that it should be possible to interfere with the nucleic acid metabolism of tumour cells by enzymic means, possibly similar to the action described by Haddow *et al.*[7] for xanthine oxidase from cows' milk, another nucleolytic enzyme.

I wish to thank Profs. A. Haddow, F. Bergel, J. Brachet and R. Jeener for criticism and suggestions.

## Variations in the Direction of Venous Blood-flow in the Mammary Region of the Sheep and Goat

IT is commonly held that the udder of the cow, sheep and goat is drained by three main veins on each side[1]. These are: (*a*) the external pudic, running with the main artery through the inguinal canal; (*b*) the perineal, running up behind the udder to the perineum; (*c*) the caudal superficial epigastric (subcutaneous abdominal or 'milk vein'), running forward along the abdomen (Fig. 1). We have made observations which are at variance with this generally accepted scheme.

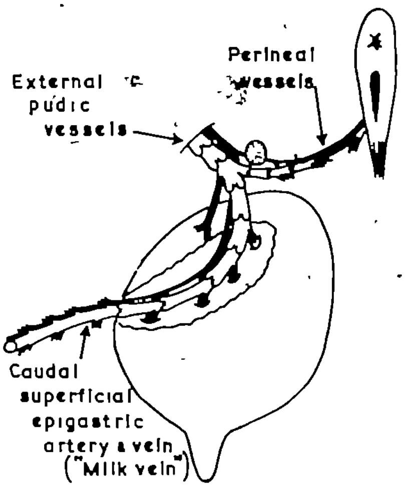

Fig. 1. Main vessels of the udder of the sheep and goat, indicating the position of the venous valves (left lateral aspect). Arteries black; veins white

At the end of an experiment involving the measurement of blood-flow through the udder of a lactating sheep, it was of great interest to find that the intramammary portion of the 'milk vein' contained valves directed caudally, although, during the experiment, blood had been flowing freely in a cranial direction through the same vein. In view of the fact that the 'milk vein', cranial to the udder, is always used as the source of mammary venous blood in milk secretion studies, we have examined a number of animals for the presence of valves and determined the direction of flow in anæsthetized and conscious animals by visual inspection, after intravenous injections of coloured solutions (milk or Evans blue) or by fluoroscopic examination after injections of iodoxyl.

In all animals examined anatomically (ten goats and ten sheep), nulliparous and multiparous, valves have been found in all three main veins in approximately the positions indicated in Fig. 1. In virgin animals all the valves were quite competent; but in pregnant or lactating animals, the valves in the 'milk vein' were often completely incompetent and allowed fluids to pass in either direction or broke down under slight fluid pressure. The angle of junction of the tributaries with the veins agreed with the orientation of the valves as regards the expected direction of flow (Fig. 1).

In some of the animals examined anatomically (five sheep and two goats) the direction of flow in the mammary veins was determined previously under anæsthesia. It was found that in the virgin sheep and goat the flow was towards the external pudic in the direction of the valves in the 'milk vein' and in the perineal vein, in both the supine and prone (standing, supported in a frame) positions. In pregnant and lactating animals the flows were also towards the external pudic in the supine position. In the prone position, however, the main perineal flow remained craniad, towards the udder (except in one animal where it was craniad near the udder and caudad near the perineum); but the flow in the 'milk vein' was reversed and carried blood cranially, away from the udder against the valves. In one lactating sheep (first lamb), in the prone position, the flow in the back half of the intramammary part of the 'milk vein' was caudad (with the valves) and that in the front half craniad. However, in a multiparous pregnant sheep and in a multiparous lactating goat the flow was craniad in the prone position along the entire vein. No blood was leaving via the external pudic vein and the 'milk vein' contained a mixture of perineal and mammary blood.

These findings have been confirmed in four conscious goats in which the 'milk vein' on one side had been exteriorized as a vein loop just in front of the udder. The animals were examined standing quietly in a stand without restraint (generally eating). In the two multiparous animals examined, the 'milk vein' flow was craniad towards the end of one lactation, when completely dry and when pregnant again. However, in two virgin kids, the flow in the umbilical region was craniad, but farther back near the udder it was quite clearly caudad.

The occurrence of valves in the perineal vein of the cow has been previously reported by Becker[2], and Becker and Arnold[3] have also described them in the other veins of the cow (which we confirm), but the actual directions of flow were not determined. However, Gracev[4] described valves in the perineal vein of goats and found the flow to be towards the udder (craniad) in eighteen of twenty-one animals, presumably supine and anæsthetized.

Our preliminary findings would indicate that the direction of flow in the veins draining the area of skin in which the mammary glands develop in the ruminant is determined by the state and history of the animal. In the virgin the inguinal and perineal areas are drained by the caudal superficial epigastric and perineal veins into the external pudic. We suggest that the great increase in mammary blood-flow consequent on pregnancy and lactation is associated with a physiological dilatation of the veins, and consequent valvular incompetence, so that the flow in the 'milk vein' is apparently reversed in the standing position and may carry mammary and perineal venous blood. Whether the flow in the perineal and external pudic veins is ever reversed in any circumstances, and whether these results apply to the dairy and beef cow, remain to be determined.

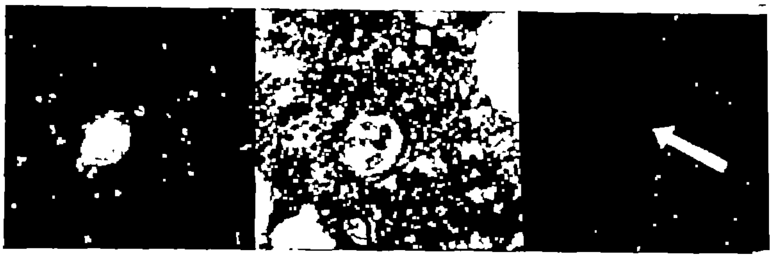
## Origin of Blood Platelets

The conclusion of J. H. Wright[1] that blood platelets are detached portions of the cytoplasm of megakaryocytes has been supported by much circumstantial evidence, and is generally accepted[2], although unequivocal direct evidence is lacking.

In the course of other experiments[3], an antiserum against guinea pig platelets was prepared in rabbits, which was rendered specific for platelets by repeate absorption with other cells and tissues, and whic upon injection into guinea pigs caused complete dir appearance of platelets from the blood withou affecting the numbers of other cells. The globuli fraction of this serum was conjugated with fluorescei isocyanate by the method of Coons and Kaplan[4] absorbed well with liver powder and used for stainin impression smears of guinea pig spleen and bon marrow, which had been fixed by immersion i 95 per cent ethanol at 37° for 15 min. After thoroug washing in saline buffered at pH 7·5, the slide were mounted in glycerol and were examined b ultra-violet illumination at 3650 A. (using a 80-W. 'Osira' lamp and a quartz cone dark-groun illuminator).



(1) Megakaryocyte stained by conjugated anti-platelet globulins (× 180); (2) same field as (1), stained with hæmatoxylin and eosin (× 180); (3) megakaryocyte (arrow) treated with conjugated normal globulins (× 180)

Apart from polymorphonuclear leucocytes, whic had a bluish-grey fluorescence, the only cells in th smears which fluoresced were megakaryocytes, and these had the apple-green colour of the fluorescein-coupled proteins. In smears treated with norma rabbit globulin conjugated with fluorescein, th polymorphonuclear leucocytes appeared the same, but megakaryocytes were unstained (Figs. 1–3).

Megakaryocytes must therefore share with platelets some characteristic unique antigenic structure, and this fact may be regarded as direct evidence o their relationship.

I wish to thank Mr. M. R. Young for carrying out the optical side of this work and for preparing the photographs.

## Microfilaræmia in Rock Rabbits

During the course of studies on transmission of Bancroftial filariasis on Ukara Island in Tanganyika, domestic and wild animals were examined for microfilarial infections. Among those infected were rock rabbits, *Heterohyrax syriacus diesneri* Brauer. Of 28 specimens of mixed sexes, 57 per cent were infected. Records of the number of microfilariæ in thin blood films, prepared by a standardized technique, are compared with body-lengths of the individual hyrax in Table 1. The results may be of interest because they show a general positive correla-

## Correlation between Cloud Shade and Shedding in Cotton

THE cotton plant is well known to shed some of its ruiting-points following periods of cloudy weather, and *such shade-induced* losses are often in excess f the natural shedding normally associated with healthy cotton plants growing in a cloudless environment. Dunlap[1] was able definitely to show that phases of excess shedding followed two to eight days after a particular cloud event. Confirmation of Dunlap's work was recently published[2], and it was further demonstrated graphically that a series of loud changes was followed by corresponding variations in the number of fruit-points lost daily from plants at Tokar in the Anglo-Egyptian Sudan. For some of the varieties tested, however, prolonged periods of cloudy weather were not associated with ustained heavy shedding.

The varieties examined at Tokar show a lag of two to four days between cloud event and the associated shedding. A direct comparison between cloudiness, as measured on the octant scale, and numbers of fruit-points shed is possible by correlating shedding with cloud events which occurred two to four days earlier. For four of the six varieties in Table 1, it was possible to demonstrate (method *A*) a direct correlation between the fruit-points lost and the highest daily cloud amount as assessed at 0600 and 1200 hr. G.M.T. Varieties *BLR* 14/25 and *X* 1730*A* failed to show a significant correlation when tested by this method; both these varieties were unable to sustain shedding at an increased rate during two or three days of continued cloudy weather. For these varieties an arbitrary method (*B*) was used in which shedding was compared with the first only of a series of cloud changes, in excess of six-eighths amount. By this method *BLR* 14/25 showed a high degree of correlation, whereas *X 1730A* just failed to reach significance level of correlation between shedding and cloud amount at probability $P = 0{\cdot}05$.

Table 1. CORRELATION COEFFICIENTS LINKING SHEDDING OF FRUITING-POINTS WITH MAXIMUM DAILY CLOUD AMOUNTS

| Variety | Method | Period examined | Calculated value of $r$ | $r$ value at $P=0{\cdot}05$ | Shedding advancement |
|---|---|---|---|---|---|
| Coker-Wilds 11 | *A* | Dec. 4–31 | 0·514 | 0·381 | 2 days |
| *BAR* 12/9 | *A* | Dec. 4–31 | 0·446 | 0·349 | 3 ,, |
| *NT* 96/40 | *A* | Dec. 19–30 | 0·735 | 0·576 | 4 ,, |
| Domains-Sakel | *A* | Dec. 14–28 | 0·587 | 0·532 | 3 ,, |
| *BLR* 14/25 | *B* | Dec. 4–Jan. 31 | 0·671 | 0·325 | 3 ,, |
| *X* 1730*A* | *B* | ,, | 0·324 | 0·325 | 2 ,, |

The varieties tested by method *B* might be considered as having become adapted to cloud-shade following the first of a series of cloud events over six-eighths amount. These varieties at Tokar developed slowly, and during December at least carried only a small boll load. The more sensitive varieties listed against method *A*, which were able to respond to most of the cloud events, had developed more rapidly and carried a heavier boll load. It is possible that this inability of some varieties to respond to all cloud events may provide evidence in favour of the usually postulated mechanism of temporary carbohydrate shortage within the plant as being the fundamental cause of shedding during periods of cloudy weather. In this way it is possible that the plants nearest maturity and with the heaviest boll loads were the most likely to be unable to tolerate temporary or continued internal shortages of available photosynthesates.

I am grateful to the Chief of Research Division, Ministry of Agriculture and Forests, for permission to publish this communication.

## Protoplasts in 'Mature' Wood Elements

IN a recent communication[1], Mia reports the presence of nuclei and cytoplasm in mature vessel elements and fibre tracheids, and states that his findings are contrary to the observations of Esau and of Eames and MacDaniels in their text-books of plant anatomy. Mia's interpretations of the statements are very loose. He quotes Esau[2]: "in the mature state, tracheids and vessel members . . . with lignified walls" are "devoid of protoplasts", and "after the secondary wall is fully formed and lignified, the swollen parts of the primary wall break down and finally the protoplasts break down and disappear". Esau's statements certainly cover the possible existence of a protoplast in a vessel element after the primary wall of the perforation plate breaks down. She does not state that disappearance of pore wall and protoplast coincide.

Mia's sketch of a vessel element is in itself proof that the protoplast is disintegrating: it is a shrunken mass restricted to a small area on one side of the cell. This is the characteristic appearance of the dying protoplast in such cells, as frequently seen in maturing xylem.

Mia does not quote directly from Eames and MacDaniels's text-book[3], but indirectly from Shah[4], with the words "the disappearance of the protoplasts usually synchronizes with the formation of perforation plates". This is not a correct quotation. Eames and MacDaniels state (ref. 3, p. 101) that when the "secondary wall is partly, perhaps even fully formed, the perforation of the end wall and loss of the protoplast begin". They make no statement as to which process is completed first, but state only that "as the cytoplasm gradually goes to pieces, it (the perforation plate) also disintegrates". Probably no critical study of the very last stages of vessel-element maturation has been made; but the protoplast must control the dissolution of the plate and therefore persist at least until the completion of the perforation. Mia has apparently described the last stage in the maturation of the vessel segment. He remarks that "the protoplasts disappear after the deposition of the secondary thickening matter"; Eames and MacDaniels stated this in 1925.

Mia also claims and figures the presence, in one species of *Corchorus*, of abundant fibre tracheids with protoplasts. His figures of these cells do not illustrate fibre tracheids but probably substitute fibres, because the pits shown are simple, as in these fibres, not bordered, as in fibre tracheids. Substitute fibres are characteristic of woody herbs, such as *Corchorus*, and fibre tracheids are usually absent.

Further, Mia finds the protoplast-containing fibre tracheids in only some varieties of jute, and vessel elements with cytoplasm only rarely. It is evident that he is dealing either with immature cells or abnormal tissues.

Shah[4], in also claiming the "rather remarkable" presence of protoplasts in "mature" wood cells of the tendrils of *Vitis*, is likewise apparently misinterpreting maturity of the cells in question. He describes vessel elements and fibre tracheids as mature because their walls are lignified. This is not proof of maturity, for it is well known that lignification of the cell wall characteristically begins long before the cell is mature. The cells figured came from immature tendril tips where there were doubtless only immature cells.

## Random Association of Points on a Lattice

FOR a lattice of rectangular array of points each of which takes any one of $k$ characters or colours with probabilities $p_1, p_2 \ldots p_k$, Moran[1] and Iyer[2] have considered the distributions for the number of joins between adjacent points of the same or different characters. The distributions for joins between points which are adjacent or not are more complicated and therefore do not seem to have been considered. The present communication gives the first and the second moments and also the nature of the higher cumulants for the distributions of the number of joins between adjacent and alternate points including diagonals of $2 \times 2$, $2 \times 3$, $3 \times 2$ and $3 \times 3$ sub-lattices, no join being counted more than once, for two- and three-dimensional lattices.

(1) *Joins between points of the same charac*

(a) $m \times n$ : *two-dimensional lattice.*

$$\mu_1' = (12b - 15a + 18)p_r^2.$$
$$\mu_2 = (12b - 15a + 18)p_r^2 + 8(69b - 145a + 299)$$
$$- (564b - 1175a + 2410)p_r^4.$$

(b) $l \times m \times n$ : *three-dimensional lattice.*

$$\mu'_1 = (62e - 75d + 90c - 108)p_r^2$$
$$\mu_2 = (62e - 75d + 90c - 108)p_r^2$$
$$+ 4(3813e - 7700d + 15490c - 31088)p_r^3$$
$$- (15314e - 30875d + 62050c - 124460)p_r^4$$

(2) *Total number of joins between points of differ colours.*

(a) $m \times n$ : *two-dimensional lattice.*

$$\mu'_1 = 2(12b - 15a + 18) \Sigma p_r p_s.$$
$$\mu_2 = 2(288b - 595a + 1214) \Sigma p_r p_s$$
$$- 2(1428b - 2960a + 6052) \Sigma p_r p_s p_t$$
$$- 4(564b - 1175a + 2410) \Sigma p_r^2 p_s^2$$
$$+ 8(564b - 1175a + 2410) \Sigma p_r p_s p_t p_u$$

(b) $l \times m \times n$ : *three-dimensional lattice.*

$$\mu'_1 = 2(62e - 75d + 90c - 108) \Sigma p_r p_s$$
$$\mu_2 = 2(7688e - 15475d + 31070c - 62284) \Sigma p_r p_s$$
$$- 2(38378e - 77300d + 155260c - 311312) \Sigma p_r p_t$$
$$- 4(15314e - 30875d + 62050c - 124460) \Sigma p_r^2 p_s$$
$$+ 8(15314e - 30875d + 62050c - 124460) \Sigma p_r p_s p_t$$

In the above expressions, $a = m + n$, $b = m$ $c = l + m + n$, $d = lm + mn + nl$ and $e = lm$ The summations extend to values of $r$, $s$, $t$ and such that $1 \leqslant r < s < t < u \leqslant k$.

The higher cumulants are linear functions of $a$ and or $c$, $d$ and $e$, and therefore as $l$, $m$ and $n$ tend t infinity all these distributions tend to the norm form so long as the $p$'s are finite. If some of the $p$' are very small, the distribution for joins betwee points of the same kind tends to the Poisson form

Similar results have also been obtained for the distributions between points separated by $h$ or les points, $h$ taking values 3, 4 etc. When joins betwee any two points of the lattice are considered, $\mu'_1$ an $\mu_2$ for the total number of joins between points o different colours reduce to the following expressions

$m \times n$ *lattice.*

$$\mu'_1 = b(b - 1) \Sigma p_r p_s$$
$$\mu_2 = b(b - 1) \{ (b - 1) \Sigma p_r p_s - (5b - 6) \Sigma p_r p_s p_t$$
$$- 2(2b - 3) (\Sigma p_r^2 p_s^2 - 2 \Sigma p_r p_s p_t p_u) \}$$

For the three-dimensional lattice also the above ex pressions give $\mu'_1$ and $\mu_2$ provided we replace $b$ by The $r$th cumulant will be of degree $(r + 1)$ in $b$ or Hence the limiting form of this distribution for larg $l$, $m$ and $n$ is normal. It may be further added tha when the points of the lattice take quantitativ values, say, $\theta_1, \theta_2, \ldots \theta_k$ with probabilities $p_1, p_2, \ldots$ $p_k$, respectively, the nature of the distribution obtained by considering the sums of the moduli or squares of the differences between observation situated on a sub-lattice similar to those discussed in this communication have also been worked out. These distributions also tend to the normal form as $l$, $m$ and $n$ tend to infinity.

Full details of these investigations will be published shortly elsewhere.

# FORTHCOMING EVENTS

### Monday, July 4

British Society for the History of Science (in the Lecture eatre of the Science Museum, South Kensington, London, S.W.7), 5.30 p.m.—Dr. L. G. A. Sims: "The History of the Determination the Ohm".

### Monday, July 4—Wednesday, July 6

Society for Applied Bacteriology (at Cambridge)—Summer onference and Annual Meeting.

oday, July 4—Tuesday, July 5

Symposium on "Food Microbiology and Public Health".

### Monday, July 4—Saturday, July 9

Museums Association (at the Barber Institute of Fine Arts, The niversity, Birmingham 15)—Annual Conference.

### Tuesday, July 5—Wednesday, July 6

Physical Society (in the Lecture Theatre of the George Holt ysics Laboratory, The University, Liverpool)—Summer Meeting—igh Energy Nuclear Physics".

### Tuesday, July 5—Thursday, July 7

Institute of Physics, Electron Microscopy Group (in the emistry Department, The University, Glasgow)—Annual Conference

### Wednesday, July 6

Royal Meteorological Society (at the College of Aeronautics, anfield, Bedfordshire)—Summer Meeting.

### Saturday, July 9—Wednesday, July 13

European Association for Animal Production (at the Univerty, Reading)—Fifth Study Meeting—"Animal Production from rass".

# APPOINTMENTS VACANT

Applications are invited for the following appointments on or efore the dates mentioned:

Senior Scientific Officer (with a first- or second-class honours egree in metallurgy, or in physics or chemistry, if with metallurgical xperience, and at least two years works or laboratory experience, referably in the non-ferrous industry) at the Royal Mint, for duties which include the supervision of production from the metallurgical oint of view; investigation of problems of material and manuacture; examination and assay of coins suspected to be counterfeit; nd research into the properties of alloys to decide their suitability or coinage—The Secretary, Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W.1, quoting S 4479/55 July 7).

Assistant Lecturer in Physics—The Registrar, Queen Mary College (University of London), Mile End Road, London, E.1 (July 9).

Lecturer or Assistant Lecturer in Botany—The Registrar, The University, Hull (July 9).

Lecturer (with a good degree in zoology, and preferably with some esearch, industrial or other relevant experience) in Biology—The Principal, Acton Technical College, High Street, Acton, London, W.3 July 9).

Research Fellow (physicist or engineer with experience of high-vacuum and high-voltage apparatus) in the Nuclear Particle Laboratory, to investigate the production of short duration, high intensity pulses of electrons with energies up to 2 MeV—The Registrar, Queen Mary College, Mile End Road, London, E.1 (July 15).

Chemical Engineer (with a first- or second-class honours degree, plus a professional qualification in chemical engineering, and experience in the chemical industry), to carry out development work to the pilot plant stage, for the Chemical Division of the Rubber Research Institute of Malaya, Kuala Lumpur, and at the R.R.I. Experiment Station, Sungei Buloh—The Secretary, London Advisory Committee for Rubber Research (Ceylon and Malaya), Imperial Institute, London, S.W.7 (July 30).

Reader in the Department of Anthropology, and a Reader in the Department of Psychology—The Registrar, Rajshahi University, Rajshahi, East Pakistan, and the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (July 31).

Research Assistant (with a good honours degree in physics and some research experience, preferably in low temperature physics) to work on the design and operation of a liquid hydrogen bubble chamber —The Head of the Department of Physics, Imperial College, London, S.W.7 (July 31).

Lecturer in Philosophy at the University of New England, Armidale, New South Wales, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, August 1).

Lecturer (with industrial and research experience) in Engineering—The Secretary, The University, Edinburgh (August 1).

Senior Lecturer in Botany at the University of Sydney, Australia —The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Sydney, August 1).

Lecturer in Bacteriology at the University College of the West Indies—The Secretary, Senate Committee on Colleges Overseas in Special Relation, University of London, Senate House, London, W.C.1 (August 2).

Biochemist (with an appropriate science degree or A.R.I.C.)—The Group Secretary, The Royal Infirmary, Bolton.

Chemist or Metallurgist (with an honours degree in chemistry or metallurgy) to carry out research on high temperature slag-metal-gas reactions—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W.1, quoting "Reactions".

Geologist (with a first- or second-class honours degree of a British university in geology, preferably with subsidiary geography) at the Ministry of Housing and Local Government in London, mainly to prepare memoranda on the distribution throughout the country of minerals of economic importance—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting G.206/5A (July 2[illegible]).

Lecturer (Grade B) in General Science in the Department of Hygiene and Public Health—The Clerk to the Governing Body, Battersea Polytechnic, London, S.W.11.

Lecturer in Education to specialize in the teaching of psychology —Prof. E. A. Peel, Education Department, The University, Birmingham 15.

Lecturer (with a degree or A.M.I.Mech.E., or higher national certificate) in Mechanical Engineering—The Principal, Faraday House College, Southampton Row, London, W.C.1.

*Nuffield Research Fellow in the Department of Zoology*, to work on reagents which will increase contrast in electron microscopy *of biological objects*—Prof. J. F. Danielli, King's College, London, W.C.2.

Physical Chemist, Experimental Officer grade (preferably with a pass degree in chemistry, or at least H.S.C. (science) or equivalent), to assist in a group engaged in the production and filling of initiation explosives and to undertake development work in this field—Senior Recruitment Officer, Atomic Weapons Research Establishment, Aldermaston, Berks, quoting 666/WJB/34.

Physical Chemist, Scientific Officer grade, in the Pedology Department, for work on ageing of oxides and the synthesis of clay minerals—The Secretary, Rothamsted Experimental Station, Harpenden, Herts, quoting "107".

Physicist (male, with a good honours degree or A.Inst.P.) for research on servo control mechanisms—The Wool Industries Research Association, Torridon, Headingley, Leeds 6.

Scientific Officer (with a first- or second-class honours degree in physics or electrical engineering, or equivalent) at a Royal Air Force Station near Maidenhead, Berks, for operational research duties, theoretical studies and development work in the field of communications and general electronics—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting A.113/5A.

Senior Experimental Officer (with at least H.S.C. in science subjects or equivalent qualifications, and with considerable experience of electronics and solid state physics), for research on the solid state with particular reference to the application of magnetic resonance techniques—The Establishment Officer, United Kingdom Atomic Energy Authority, Atomic Energy Research Establishment, Harwell, Didcot, Berks, quoting 2/103/354.

*Senior Experimental Officers and Experimental Officers* (with at least H.S.C. in science subjects or equivalent qualifications, and with training in *radio*, electronics *or* physics, and preferably several years experience in the design and development of electronic equipment) *in the Geological Instrument Group, for duties concerned* with the design, development and servicing of electronic radiation *measuring equipment for use in geological prospecting for radio*-active minerals—The Establishment Officer, United Kingdom Atomic Energy Authority, Atomic Energy Research Establishment, Harwell, Didcot, Berks, quoting 2/103/355.

# RESEARCH IN MAN-POWER

ALTHOUGH the recommendations of the National Manpower Council in "A Policy for Skilled anpower"* are too closely concerned with contions in the United States to be of more than very direct interest in Great Britain and elsewhere, the atement prepared by the Council has implications hich deserve close attention from all concerned ith the use and training of skilled man-power. They bear on the development of technical and echnological education; for example, the shortage of cience teachers and the differentials between skilled and unskilled workers. Moreover, in spite of the greater difficulty which the Federal State structure of the United States places in the way of a national policy, the report should bring home to any reader he imperative importance of viewing these related problems as a whole and of insisting that the ational interest should over-ride sectional interests r prejudices.

Of the five major long-range objectives which the National Manpower Council suggests should be pursued if the United States resources of skilled workers and technicians are to be strengthened, he first—strengthening the contributions made by econdary education to the acquisition of skill—consorts well with the policy of increasing the number of technical school, as well as of grammar school, places announced by Sir David Eccles on April 26, as does Sir David's intention of seeing that no area fails to provide fifteen to twenty-five per cent of such places with the third objective of more equal opporunities for all individuals to acquire skill. It will be noted that in the United States this latter objective is more concerned with the elimination of discriminations of race, creed or sex which prevent the utilization of existing opportunities. In Britain, the problem is rather one of increasing the opportunities available, of seeing that they are fully utilized and that they are related quantitatively to the country's needs for skilled man-power and to the resources from which those needs can be met.

Speaking at the opening of the new Technical College at Devonport and Plymouth, Dr. (now Sir) Alexander Fleck said that Britain has only 64,000 scientists and needs 90,000, and that the shortage is greatest in technologists. He also added that we need people at all levels with the powers of leadership combined with a scientific background. On its production side, industry, for example, needs three types of leaders—scientists, technologists and technicians—as well as a great body of skilled craftsmen. Competent judges, however, have expressed the opinion that the universities, which, since 1931, have increased the number of students reading science and technology by about 14,000, in spite of a decrease of about 1,500,000 in the age-group from which the student element in the population is drawn, are already absorbing very nearly all those who are inclined to take a university degree and have the ability to acquire entrance qualifications to a university. More people can accordingly only be attracted into science and applied science courses by diverting them from other fields of university study.

If, therefore, we are to expand our facilities for scientific, technological and technical training and they are to be used effectively, it is not so much vocational guidance that is needed as more accurate knowledge about our man-power resources and the needs they are called upon to meet. To acquire such knowledge is the first step towards formulating a national policy, and the importance of such reports as that of the Appleton Committee on the Supply of Teachers of Mathematics and Science in Scotland, of Sir Philip Morris's Committee on Graduate Teachers of Mathematics and Science, of the Federation of British Industries on the Shortage of Science Teachers, or of the Central Advisory Council for Education on Early Leaving is to be assessed in this perspective. It can then be seen how much more knowledge is still required and how urgent it is that the Technical Personnel Committee of the Ministry of Labour and National Service and the Scientific Manpower Committee of the Advisory Council on Scientific Policy should expedite their inquiries. Apart from this, the University Appointments Board and such bodies as the Federation of British Industries could possibly help to expedite compilation of the data essential for sound decisions both as to the scale on which new facilities should be provided and as to the balance between them.

Such decisions involve, moreover, consideration of the methods used for training skilled and technical man-power and where that training, in its varied types, is best given, not only as between the university, the college of technology, the technical college or technical school, but as before or after entry to industry. It means that industry must be clear in its mind as to the types and quality of the recruits it requires and the prospects it can offer them. Such questions in themselves affect both the number of science and technical teachers required and the extent of the scientific and technical teaching as well as its nature and the general education to be given. Moreover, as the survey of vocational and non-vocational further education and training carried out for the National Institute of Adult Education by a Committee of which Sir Robert Wood was chairman and Dr. P. F. R. Venables vice-chairman shows, the professional institutions have a major responsibility here.

The Committee reached the firm conclusion that the present narrowness of technical studies is largely due to the framing by some professional and examining bodies of their syllabuses and papers so as to put a premium on the memorizing of facts rather than on the discussion of underlying principles. The Committee suggests that such bodies should re-examine the purpose and nature of their examinations, and it also makes the sound suggestion that students should be allowed to use in the examination room the kind of reference books without which they would not dream of practising their profession.

---

* National Manpower Council. A Policy for Skilled Manpower: a Statement by the Council, with Facts and Issues prepared by the Research Staff. Pp. xxvi+200. (New York: Columbia University Press, 1954.) 4.50 dollars.

That is one handicap which technical institutions encounter in trying to introduce liberal values into vocational studies. It is clear, however, from this survey that many principals and teachers in such institutions already hold a generous view of vocational education and that, examination requirements apart, the hindrances due to unsatisfactory physical requirements, inadequate library provision and the like, would easily be overcome if industry demonstrated its desire for a more liberal education both by insisting on it in its requirements and by generous support in the provision of new and improved facilities at the technical institutions. The responsibility of industry is fully recognized by the National Manpower Council, particularly in connexion with the fourth of the five long-range objectives which its policy for skilled man-power stipulates—the improvement of the facilities and methods used for training skilled and technical man-power. Indeed, it states frankly that its objectives can be achieved only through a continued and many-sided effort sustained by an informed public opinion and the co-operation of the schools, employers, labour organizations, voluntary groups, the Armed Services and local, State and Federal Governments.

Industry will not, in fact, discharge its major responsibility for the development of the nation's skilled and technical man-power merely by closer attention to training within industry. The very fact that so large a proportion of workers acquire their skill on the job should make industry consider very carefully what technical training it requires of those entering industry. Even where the university graduate is concerned it is at least possible that the arts graduate could be employed in some positions for which it is customary to stipulate the engagement of a science graduate. Such possibilities would be considerably extended if the universities made it their business to see that the arts graduate left the university with at least that understanding of what science is and how it works which should be an essential part of the equipment of every educated man and woman in this technological age.

That bears on the question of general education which in the United States in the technical institute, the vocational high school and the engineering college is now as live an issue as it is in Britain in the colleges of technology, the grammar schools and elsewhere. Although the line between vocational and general education is admittedly blurred to a certain extent, the study made by the research staff of the National Manpower Council brings little fresh information to light that bears on the problem of general education in Britain, other than to indicate the value of general education in developing the versatility and adaptability demanded by an era of rapid technological change with its attendant changes in the types of skill demanded. This is a factor which was emphasized at the recent Conference on Education in a Changing World, as well as at th of the Institution of Production Engineers on aut matic methods in industry at Margate during Ju 16–18. It is clearly one of which close account mu be taken both qualitatively in relation to gener education and quantitatively in planning the expa sion of technical and technological education. Som agreement must be reached as to the nature ar extent of the industrial contribution to be give within industry, whether by industrial firms through the research associations, before any soun assessment can be made of the number, the locatio and the nature of the courses which the technic colleges and technical schools as well as the college of technology should provide.

What needs to be emphasized here is that, so fa as the Government is concerned, the division c responsibility between the Minister of Educatio and the Lord President of the Council offers possibilities of overlapping and waste of effort if eithe Minister fails to take a broad view of his responsibilities. The Advisory Council for Scientific Polic should be well aware of the danger, and the Parliamentary and Scientific Committee could help to se that there is full co-ordination of effort at a poin where it is essential if serious waste of one of ou scarcest resources is to be avoided.

The National Manpower Council places a large share of responsibility for the necessary research on man-power resources on the universities and foundations, specifying particularly the desirability of more knowledge as to the complex process of occupational choice, the role of skilled and technical man-power in economic development, the impact of government policy upon the supply of skilled man-power resources and the relation between how people are trained and their subsequent performance at work. In the United States the National Science Foundation is already engaged in some of this fact-finding either directly, or by arrangement with the National Bureau of Economic Research or other bodies, as Dr. A. T. Waterman, its director, indicated at the sixth Annual Conference on Industrial Research on June 6. In Britain, apart from the work of the Technical Personnel Committee of the Ministry of Labour and the Scientific Manpower Committee of the Advisory Council on Scientific Policy and certain inquiries pursued by Political and Economic Planning, some of the investigations under the two Committees on Human Relations in Industry and on Industrial Efficiency in Industry should throw light on the problems indicated by the National Manpower Council; but the technical study which the National Science Foundation is sponsoring of methods for determining the demand and supply of specialized personnel should be of particular interest to Britain.

As to how the training of skilled and technical man-power could be improved the present study gives little indication; but this aspect of the man-power problem should be engaging the close attention of professional institutions and of the trade unions. Without their full co-operation and understanding it will be impossible to frame, let alone execute, a man-power policy adequate to the country's needs, even if the estimates s to the numbers of skilled workers which the oming of the automatic factory and the adoption of lectronic computation will require prove to be exaggerated. When the secondary schools, the technical colleges and the universities have dealt satisfactorily with the problem of general education and secured the increased number of science teachers required to provide both an adequate number of graduates in science and technology but also arts graduates and school-leavers in general with an understanding of what science is which enables them to play an effective part in an industrial world based on science and technology, the increased supply of educated and trained workers will not be used efficiently and flexibly without relaxation of craft rules and trade union practices.

Moreover, besides the character of professional examinations stressed by the National Institute of Adult Education, there are other hindrances to the recruitment of more technical workers. Although their number is increasing, it is not increasing in proportion to the demand for their services which arises from advances in science and technology, particularly when an existing shortage of more highly trained scientists makes it necessary to use less highly trained technicians wherever possible. The automatic factory of the future threatens to displace the semi-skilled operative and thus to accentuate the demand for skilled- and flexible-workers parallel with the tendency for technicians to carry out tasks formerly entrusted to professional workers, and the study made by the National Manpower Council reiterates accordingly the importance of workers possessing a broad foundation of basic knowledge and skills together with attitudes which will facilitate their learning new tasks as the need and opportunity arise.

That, as already indicated, consorts ill with rigid apprenticeship systems or trade union rules and practices. Another difficulty is the decreasing differential between the wages of skilled and semi-skilled workers. Although on the evidence presented to it the National Manpower Council concluded that in the United States at present the long-term decline in the relative wage advantage of skilled workers had not produced and was unlikely to produce a general shortage of skilled workers, it appears to be a factor which should not be disregarded. In Britain, quite apart from repercussions of which the economy has recently been made unpleasantly aware, it could be a serious factor against obtaining a supply of those ready to assume the increased responsibilities as well as acquire the greater skill that the advent of the automatic factory would demand.

Apart, however, from its demonstration of the importance of a carefully thought-out and co-ordinated national policy for scientific and technical man-power and its demonstration of the many factors that enter into the formulation of such a policy, the statement of the National Manpower Council is of interest to British readers for its emphatic indication of the observations in the recent Appleton Report on the crucial importance of an adequate supply of suitably qualified teachers. In the United States, as in Britain, any inadequacy in the teaching of mathematics and science is a national problem which, if unsolved, may endanger the whole national economy, if not indeed the national safety. This is the first and most urgent matter to which our attention should be given, and it is to be hoped that the statement and the evidence on which it is based will receive careful study, above all by those who, like the Parliamentary and Scientific Committee, which has already discussed the expansion of colleges of technology with the Minister of Education, are best placed to further an impartial, all-party approach and to foster the concerted and fully co-ordinated action required.

---

# MEDIEVAL COSMOLOGY

## Le Système du Monde

Histoire des Doctrines Cosmologiques de Platon à Copernic. Par Prof. Pierre Duhem. Tome 6. Pp. viii+740. (Paris: Librairie Scientifique Hermann et Cie., 1954.) 2,900 francs.

THE first five volumes of Duhem's "Le Système du Monde" appeared in 1913. The author then hoped that the work would be completed in eight volumes; but already, at his death in 1916, ten had been written, and still the task which he had set himself was unfinished. The distractions of war and the economic difficulties that followed, however, prevented any further publication, and for many years copies of the published volumes have been eagerly looked for from second-hand sources. A second edition has now been issued, and with it appears, for the first time, Vol. 6.

This happy event, for which all interested in these subjects will be grateful, has been made possible by the patronage of the Paris Academy of Sciences, to the care of which Mme. Hélène Pierre-Duhem, the author's daughter, long ago committed the manuscript. The co-operation of the Centre National de la Recherche Scientifique was secured and has been promised for the gradual issue of the succeeding volumes. Mme. Pierre-Duhem introduces the sixth volume with a short note explaining these circumstances.

Duhem's "Le Système du Monde", by virtue of its scope, its wealth of detail, and the number of previously unexamined manuscripts on which it is based, is unique among the histories of early cosmological thought. Whereas such a valuable work as Dreyer's "History of the Planetary Systems from Thales to Kepler", for example, is confined strictly to the purely astronomical problem of the structure of the mechanism of the heavens, Duhem treats cosmology in a far wider sense and includes the whole system of philosophy of which astronomy was but one aspect. It is thus at the same time a history of philosophy and a history of science for the periods with which it deals. Though the author's treatment of the subject-matter has not escaped criticism, the work is by common consent an indispensable source of information to all who would form a true idea of the heritage of modern science.

The sixth volume is chiefly concerned with the ebbing of Aristotelianism during the few decades following the death of Thomas Aquinas in 1274. The best-known figures of this period, Duns

Scotus and William of Ockham, as well as those of lesser note such as Henry of Ghent, Richard of Middleton, Giles of Rome and others still less familiar, are presented in the manner characteristic of the author's earlier work, and the story is carried up to Jean Buridan and the beginning of the Paris School of the fourteenth century which, in kinematics in particular, anticipated Galileo in so interesting a manner. For the full treatment of this movement, however, we must wait for the next volume.

The great value of these detailed discussions of the minor, as well as the major, thinkers of those days is that they enable us, as nothing else can, to recover the intellectual atmosphere of the times and to view the problems faced as they then appeared and not as they present themselves in the light of modern knowledge. What now often appears as mere idle verbiage is thus seen to have had a real and vital content, and sometimes to be simply a translation into an outworn language of problems with which we still wrestle. There is a story of an examining body which set the same questions every year, but prevented automatic passing by varying the answers. Whatever may be said for this as an examination device, it is certainly closer to the history of thought than the common practice. The fundamental problems of philosophy remain the same; but each age, seeing them in its own light, gives its own answers. That is not to say that progress is not discernible in the answers.

The appearance of the remainder of this great work will be awaited with feelings of the liveliest expectation.

HERBERT DINGLE

## BIOLOGICAL GROWTH

### Dynamics of Growth Processes

Edited by Edgar J. Boell. (A symposium of the Society for the Study of Development and Growth.) Pp. vii+304+21 plates. (Princeton, N.J.: Princeton University Press; London: Oxford University Press, 1954.) 60s. net.

THIS volume represents the proceedings of the symposium on growth held in Williams College, Williamstown, Mass., in June 1952, under the joint sponsorship of the Society for the Study of Development and Growth and the National Research Council's Committee on Developmental Biology. Although the eleventh symposium of its kind, it is the first to have been published in book form: its predecessors appeared as supplements to the journal *Growth*. Inasmuch as publication did not take place until 1954, and some of the articles deal with lively and quick-moving subjects, one cannot but reflect upon the wisdom of the change.

The symposium is an altogether crisper and more down-to-earth affair than its title might suggest. (What would be the 'statics' of a process which is, of its nature, one of transformation?) A certain order is imposed on what would otherwise be a miscellany by arranging the articles in ascending order of the size of their subject-matter, starting with viruses and protein molecules and ending with the growth of whole organisms and their populations. It is inevitable that the articles on the more rapidly growing subjects should be the first to 'date'. One must not overestimate the danger: new hypotheses on the nature of molecular 'replication' have appeare since the preparation of the present article on viruse but its general conclusions remain essentially soun Other articles deal with amino-acid and protei synthesis, the interrelation of nucleus and cytoplasm and cellular differentiation in animals and plants with the physical, chemical and endocrine control growth; with hereditary mechanisms, and with th growth-curves of individuals and populations. All ar by scientific workers distinguished for their contr butions to these several fields; none is a mer inventory of information, and some are written wit a real sense of style.

We are left with a useful synoptic picture of th problems of growth that are most insistent at each level of the hierarchy of sizes and complexity; w learn how little in growth can be usefully thought o as merely scalar and quantitative, and how much at every level of complexity, depends upon vecto properties—organization and form.

## CLASSIFICATION OF INSECTS

### Classification of Insects

Keys to the Living and Extinct Families of Insects, and to the Living Families of Other Terrestrial Arthropods. By Prof. Charles T. Brues, Prof. A. L. Melander and Prof. Frank M. Carpenter. (Bulletin of the Museum of Comparative Zoology at Harvard College—Vol. 108. New edition.) Pp. v+917. (Cambridge, Mass.: Museum of Comparative Zoology at Harvard College, 1954.) 9 dollars.

THE previous and first edition of this well-known work appeared in 1932. The present revised edition contains half again as many pages. Most of these additional pages are due to greatly extended lists of references to the different orders of insects, the references to the Diptera, for example, occupying a hundred and twenty-four pages instead of twenty-seven. Another important and useful addition is a section of fifty pages on fossil insects. More than a hundred new illustrations have been added. There are scarcely any typographical errors, and the print is easy to read.

The extended lists of references will be useful to students; but the selection of some of these has not been done with sufficient care. References to the Tipulidae include six pages devoted entirely to listing the papers by Alexander. Some of these should be cited; but the great mass are small papers not relevant to the purpose of the book, as each is concerned with describing a few new species, and no keys are given. Sometimes the same paper is listed as a reference for two quite different groups of insects. For example, Brown's revision of the North American Aegialidae is listed in the references to both the Tenebrionoidea and Scarabaeoidea. No consistent system of abbreviation of references is used.

In a "Conspectus of the Higher Groups of Insects" (pp. 17–25), the families and higher groups are listed in the order in which they are afterwards treated. In the introduction the authors say that this list ". . . aims to present a natural classification as nearly as this can be expressed in a linear sequence". In this aim they have failed signally. The Collembola, which are not insects, are listed between apterygote and pterygote insects. One of the suborders of the Dictyoptera is given ordinal rank and the other, the antodea, is included in the Orthoptera. It is nerally accepted that the Psocoptera are closely lated to the Mallophaga and Anoplura; but the raptera, which are unrelated to these three orders, e placed between the Psocoptera and Mallophaga. ranger still, and quite inexcusable, both the orders ysanoptera and Hemiptera are entered between e Mallophaga and Anoplura.

The treatment of family relations within orders is ry unequal in quality. The beetles fare the worst. or example, no mention is made of the suborder rchostemata, and the Cupididae are placed in the border Adephaga. The Chelonariidae and Limniidae are in the Dascilloidea instead of in the ryopoidea, where they rightly belong. The families f the Cucujoidea are scattered at random between neir superfamilies Mordelloidea, Colydioidea and enebrionoidea. Of the families of the Bostrichoidea, he Ptinidae are included in the Dascilloidea; but the ery closely related Anobiidae, Bostrichidae and yctidae are placed in the Colydioidea. The Ptiliidae re included in the Colydioidea, to which they are ot remotely related. Most of these major mistakes ccur in the first edition. In the past two decades one, so far as I know, has accepted these views on he classification of beetles.

The Papilionoidea are listed by the authors as the most specialized Lepidoptera and are placed far from he groups to which they are related. The first four amilies they include in the Tineoidea are all Tineidae, nd both their *Amadryidae* and *Setomorphidae* are more closely related to *Tinea* than some of the genera included by them in the Tineidae. In the section on Diptera, the Simuliidae are said to be peripneustic, whereas in fact they are apneustic, and they have mistaken the dorsal for the ventral side of the common *Dixa*.

Throughout the work the term 'chitinization' is used when the authors mean 'sclerotization'. On a lighter note, it may be mentioned that, according to the authors, one of the characteristics of Micropterygid larvæ is that they have three-dimensional setæ.

H. E. Hinton

# SILICATE THESAURUS

## The Physical Chemistry of the Silicates

By Wilhelm Eitel. Pp. xvii+1592. (Chicago: University of Chicago Press; London: Cambridge University Press, 1954.) £11 5s. net.

In variety and ubiquity the silicates almost rival the carbon compounds, and there are indeed certain similarities between the two series. The basis of variation in the silicates, for example, is the tetravalent silica tetrahedron (compare with the carbon atom) which may link up with other silica tetrahedra, or with other ions or complex ions, to give stable three-dimensional networks. The numerous ways in which linkage can occur lead to such a variation in silicon/oxygen ratios that in pre-Bragg days a bewildering array of hypothetical 'silicic acids' was postulated; only with the application of X-ray techniques was the simplicity inherent in this apparent complexity revealed.

The compounds concerned being so numerous and varied, it is scarcely surprising that consideration of their physical chemistry has necessitated such a large volume as the one under review. Nevertheless, some idea of the growth of this subject during recent years is afforded by the fact that the volume is almost twice the size of the previous (German) edition of 1941, which in turn, despite the omission of much text-book material, was about half as large again as the original German edition of 1929. The space devoted to the various topics in each edition may also serve as some guide to the relative rates of progress in each field. The present edition is stated to be based upon a translation of a third unpublished German edition completed in 1945; but it is obvious from even a cursory glance that much later material has been added; the most recent reference noted was to a paper published early in 1953.

It is indeed refreshing in these days of symposia to encounter such a comprehensive treatise from the pen of one author, and this only serves to emphasize the vast extent of Dr. W. Eitel's knowledge; his experience of the subject, both as director of silicate research institutes and as teacher, is surely unique. It should be added that he has cast his net widely and has, indeed, made a liberal interpretation of "physical chemistry". The field covered by the book is best indicated by listing the section headings: states of silicates (crystalline; fused and glassy; colloidal); fusion and polymorphic equilibria in dry systems (general remarks; special systems); pneumatogenic and hydratogenic silicates (systems with volatile components; hydrates of the zeolite, permutite group); solid-state reactions (general; ceramics; hydraulic cements); and silicate melts (glasses; slags). In such an immense field each reader could doubtless find aspects he might feel were inadequately treated, or observe omissions; for example, a surprising omission, to the reviewer, was the absence of reference to the book "X-Ray Identification and Crystal Structures of Clay Minerals" (published early in 1951) in spite of the space devoted to this subject. Yet, considering the book as a whole and remembering that it covers the period up to late 1952, little criticism can be made on the grounds either of inadequacy or omission, and the book is indeed a valuable compendium; that it is in many respects encyclopædic rather than critical in no way detracts from its value.

The bibliography is very complete, and the multitudinous footnotes serve as an excellent medium for providing information additional to that given in the text. A special numerical system of referring to journals is employed; although the numbers of the most usual journals soon become familiar, this, at times, forms a source of irritation as one has to consult the key at the end of the book before one can trace the journal—while the possibility of typographical errors in numbering always exists. All six indexes are clear, and appear to be carefully compiled. The diagrams are, on the whole, excellent, although a very few, such as that on p. 1112, might perhaps have been better chosen; the numerous phase diagrams will delight those on whose sphere of work they impinge. A number of typographical errors and misprints were observed; but all should be obvious to the careful reader. Only one slight, and perhaps excusable, error of fact was observed in those sections of which the reviewer has most knowledge.

In general, the book is well printed and well bound, and both author and printer are to be congratulated on its expeditious production. It is a volume which in spite of its cost should find its way on to the reference book-shelf of all interested in silicate chemistry.

R. C. Mackenzie

# HISTORY OF COLE (*Brassica* sp.)

## By G. E. FUSSELL

A FEW hundred acres of cole or rape are still grown in most counties[1]. Some farmers expanded the acreage under the crop during the war years, notably in Yorkshire, but it has lost the importance it enjoyed between 1650 and 1850. The Fen farmers no longer rely upon it as a cash and forage crop, though it was once a most valuable 'vegetable' for reclaiming newly drained lands.

Like many grasses and roots that have become important in our farming, rape is indigenous, being native to our sea-shores. At the beginning of the eighteenth century the wild *Brassica oleracea* was gathered for human food; people living near the coast preferred it to cabbage. Turner had seen it long before near Dover[2]. It did not become important as a table succulent, but as a green fodder crop and an oil-producing seed crop, its residual cake proving useful as a feeding stuff and manure.

John Smith suggests that some varieties were introduced by the Romans[3]. Rape was certainly cultivated in Classical times. Several Latin works on agriculture contain references to it; but it is not easy to decide just what plant is meant. Pliny is the most definite. He knew three kinds of *rapa*: one flat and broad, the second round like a ball, the third wild with a long radish-like root, pointed rough leaves and acrid juice[4]. This suggests tankard and globe turnips and rape or cole. Pliny thought *rapa* could be sown where scarcely any other crop would succeed, being nourished by mists, hoar frosts and cold to a prodigious bulk. He had seen some of more than forty pounds weight.

Both Columella and Palladius, however, advise that the two things require different soils. The *rapa* delight in low, wet lands, the *napus* in dry sandy soils. Both believed that if grown in the opposite soils the plants would change into each other in two years[5]. The rustic Roman ate both *rapa* and *napus*; but the *rapa* was most useful for cattle. It was used in Gaul as winter feed. Pliny agreed with this. The boiled seed was excellent for fowls, and livestock flourished on the leaves.

All this must have been known to medieval scholars, but did not lead to the cultivation of either kind of *Brassica* as forage or industrial crops. Barnaby Googe, the Lincolnshire squire who translated and expounded the "Whole Art of Husbandry" (1577), was acquainted with Columella's statement and had seen rape or cole cultivated in the Principality of Cleves. He thought it valuable for green manuring, for its oil seeds and sheep fodder[6]. His remarks did not induce anyone, even himself, to grow the crop.

Rape seed was extensively grown in Belgium in the late Middle Ages, to which country it may have been brought from Holland. This was *Brassica rapa rapifera*, described by Dodoens as sown before the winter after corn harvest. It was also sown on the fallow after oats. The crop was heavily manured and was rather costly. A tenant of Hof ter Kluizen who paid 70 pound of rape seed with his corn rent in 1470 could substitute an equal quantity of wheat if rape failed.

A Belgian farmer with more rape than necessary to feed his cattle as green fodder let it run to seed in the spring and harvested the seed for sale. It wa grown on a large scale in Waes and sold in th markets of St. Nicholas in Ghent, at Louvain an Mechlin.

The name 'cole seed' first occurred in the sixteent century when Dodoens mentioned "sloren", a cabbag grown only for its seed. This Lindemans believes t have been developed from rape, though not i Belgium. After 1550 Belgian leases speak of cole seed instead of rape-seed. This was a more profitabl crop, the yield greater and the seed much riche in oil. It was *Brassica oleifera*, and became th most cultivated oil plant of West and Middl Europe.

The centre of cultivation in the Middle Ages wa perhaps in the Netherlands, most likely in the north whence it passed to Belgium, France, Artois an Picardy, and in the second half of the sixteenth century to the Rhineland and mid-Germany[7]. Thi may be a correct assumption; but the plant or some form of it was known in classical Gaul. Did it continue to be cultivated there, and how did it get to North Holland, whence it could continue its travels in the late Middle Ages?

Whatever the history of the crop in Europe, the drainers who came from the Low Countries with Vermuijden introduced it to the Fenlands of Britain. The fenmen strongly resented the activities of the drainers, and did their best to destroy the works. So early as 1639 there were riots in Lincolnshire, with great loss and damage, especially to crops on reclaimed land, which included "great crops of rape, cole-seed, corn and other grain"; while about 1646 the "Anti-Projector" (an anonymous pamphleteer) was asking scornfully, "What is cole-seed and rape? These are but Dutch commodities and but trash and trumpery"[8].

Many Walloons and French-speaking Hollanders from Picardy and North Flanders settled in Thorney after its drainage by Francis Duke of Bedford in Charles I's reign. They were expert in the cultivation of colza, from which they extracted oil.

The new crop (if it were new) immediately found its way into the text-books. Both Walter Blith and Samuel Hartlib came down heartily in favour of it. They and their successors for a century or more emphasized the importance of obtaining seed from Holland.

Blith looked at the matter both generally and particularly. Cole was most useful on marsh, fen, lands newly recovered from the sea, or any lands flat and rank. It should, as Palladius had said so long before, be sowed about midsummer. The fen-land was carefully prepared. The surface was pared off with a paring plough[10]. The turves were stacked in small heaps and burned (a process called denshiring elsewhere), the land thoroughly ploughed and ridged up. Cole-seed was then sown, and the crop harvested the following summer[11].

Blith's advice was based on practical work done in the reclaimed Fens. Vermuijden reported in 1652 that 40,000 acres of the South Level had been sown with cole, seed wheat and other grain. In the Bedford Level, "a small quantity of about 28,000a." had been cultivated. The result of the first year's crop was most profitable[12].

Hartlib optimistically estimated that 380,000 acres of the great fen of Lincoln, Cambridge and Huntingdon had been reclaimed by 1655. Its value was high. friend offered a mark an acre for 900 acres on which to sow rape, land formerly scarcely worth 12*d*. an cre.

The work went on and by the end of the seventeenth century a large area was cultivated. In 1657 it was grown between Ely and Southery; by 1696 there were great crops between Spalding and Crowland. Here were oil mills in which the seed was crushed between marble stones imported from Germany. Shipments of rape oil to London were made both from Wisbech and King's Lynn at about this time[13].

Rape was grown in Kent almost as early as in the Fens. Rochester exported thirty quarters of rapeseed to Dieppe in 1660–1—presumably the product of the county[14]. Casual shipments, too, went out of Hull between 1620 and 1670[15], although where it was grown I cannot say—perhaps in Yorkshire or in Lincolnshire; it may have been grown in Essex before the Fens.. Five quarters of rape-seed was exported from Malden in 1611, and ten quarters from Colchester in 1631, Maldon exported 353 quarters and in 1642 Colchester exported 5,000 rape seed cake[16].

By 1716 home-grown seed was nearly as good as that imported from Holland; but perhaps not so plentiful. It was still sown at a gallon or 4 lb. an acre in July on carefully prepared land, ploughed in May and again in June. As the crop became more familiar, its use as green fodder and its residue as dry feed was recognized. In Holland, rape was used for feeding oxen in winter, and that lesson was learned. English farmers used it in January, February and March "when other food is wanting". If fed one winter, it would often produce a good crop next year, and when cut the stubbs would sprout again and afford excellent nourishment for sheep.

If for seed it was reaped with the sickle in the same way as wheat, placed in small yealms or heaps to dry, gathered in large sheets and carefully threshed in the barn because very apt to shed. Lincolnshire growers threshed in the field on a sheet laid on a specially flattened piece of ground. The average yield per acre was five quarters, worth £5. Here the refuse cake was used as fuel, because the county was short of wood. Northamptonshire farmers made a better use of the cake. They fed calves from three or four days old on a mixture of powdered cake and water[17] instead of milk. The calves flourished.

The advantages of the crop were so evident that it spread to other places by the middle of the eighteenth century. In the Chiltern country it was a great success. Gloucestershire farmers were growing it on pared and burned land, though they used a breast plough to cut off the turf. Farmers near Chelmsford, Essex, were cultivating it. At Chertsey, Surrey, and Gaddesdon, Herts, the seed was sown in beds and the young plants transplanted when a few weeks old, as Palladius had recommended.

Much of this expanded acreage was for feed. Near Richmond, Surrey, and other places it was given to the ewes that suckled house lamb—a profitable business near London. If fed to cows or sheep, care must be taken not to cause hoven, or make the milk rank by giving too much at first. The animals fattened quickly on it, and a rape crop opportunely provided feed after the turnips were gone. It promoted milk yield, too.

Some farmers had begun to sow rape on one ploughing after a cereal crop, others to sow in February and feed off in midsummer—practices that developed. When sown after a cereal, ten bushels of Newbury or Hampstead peat ashes were added as fertilizer[18]. This was a novel modification of the methods introduced in the Fens.

It was not until 1756 that a hint was given that the rape- and cole-seed imported from Flanders was "not all the same kind". The plant was, said Thomas Hale, equally native of England and Flanders but did better in the latter country. Flemish seed was always to be had and always best[19]. John Mordant was sceptical about overseas seed. Home supplies were excellent. He repeated the general advice, current for a century[20].

A few years later both Nathaniel Kent and James Adam advised farmers to consider that cole occupied the ground for a whole year, and must therefore produce a profit equal to that gained from barley crop and turnip crop together. If they could make it do that, it was in addition exceedingly useful in cleaning and meliorating land.

Adam thought cabbage had begun to supersede it for feeding cattle by 1789. He quoted the Marquis of Turbilly on the Flemish method of sowing the seed in beds and transplanting it like ordinary garden cabbage. The land must be ploughed twice before winter, and again in May, harrowed two or three times, ploughed again towards the end of July, the seed sown and harrowed and rolled in. 24 lb. seed sown on three acres would provide plants to set out on twelve acres. Early in October the best plants were selected for transplanting into rows one foot apart at six-inch intervals in the rows. Harvesting was carried out as usual. Essex farmers, however, generally reaped cole and prepared frames lined with threshing cloths, each drawn by one horse, to receive the heads of the plants as fast as they were cut off. When properly managed, nothing paid better, but the product must have been sold at a high price to cover all the seed-bed preparations and careful handling[21].

Transplanting was done in two ways in Brabant. A hole was made with a special spade at the required intervals and a plant put in by a child, who pressed the soil firmly around the roots, or the plants were placed by hand at regular intervals in the furrows and covered with the earth turned upon them when the ploughman turned the next furrow. The manual method was described by the Abbé Mann. Arthur Young saw it near Cambrai on the oat stubble after one ploughing in October. Here and at Valenciennes the hole for the plant was made with a large dibble. Josiah Ringstead was the first to recommend mixing the seed with earth or sand to prevent it growing in clusters[22].

Young himself could not make cole-seed yield heavily enough to be profitable, though Philip Miller had said one acre of cole equalled two of turnips for feeding[23]. In spite of this, Young was enthusiastic about its cultivation by Essex farmers in 1807. They often grew cole on a fallow as they did turnips; but had generally found newly broken-up ground best. Three or four pints of seed were enough if grown for seed production, but for fodder five or six were often necessary. Charles Vancouver described transplanting at twelve inches square at a cost of a guinea an acre that was always profitable. The straw of rape made excellent litter. His estimate of yield was twenty-nine bushels an acre; but Mr.

Dudley, of Bradwell, an experienced grower, set it at thirty-four. Dudley thought feeding cole-seed in the county was declining, the leaves having been found better. Nevertheless, it was widely grown from Hedingham and Finchingfield to Maldon for seed. The farmers found it very profitable. In Rochford Hundred immense quantities were grown, cut with a short, strong scythe made for the purpose, and carted to the farmyard to feed bullocks. Mr. Claydon, of Audley End, and many other farmers all over the county sowed it for sheep or green manure. The crop was prohibited on the Winchelsea Estate, Foulness Island, because it exhausted the land and promoted weeds—an opinion then not widely shared[24].

By this time farmers in several counties often far removed from the Fenland grew the crop. Among these were Gloucester, Hampshire, Kent, Stafford; the farmers of Lincoln, Suffolk and Yorkshire continued their allegiance to it[25].

Sinclair was as enthusiastic as Young. In Flanders, he said, it was found to destroy the *gyrllo talpa*, so injurious in wet soils. The cake had long been used in various parts of England as manure, particularly in Yorkshire and Norfolk. It was broken up and ploughed in about six weeks before seeding. Ploughed in with wheat seed, it was particularly forcing. Flemish farmers of seventy-five acres bought as much as 5,000 rape cakes and 3,300 poppy-seed cakes, costing nearly £60 a year[26].

Twenty years later, members of the newly formed Royal Agricultural Society could read in their *Journal* how the plant was grown in Schleswig-Holstein, Lauenberg and Mecklenberg, and praise of the oil produced from the seed. When purified, it was without smell, gave a brilliant clear burning flame and was universally used all over Germany in the saloon and cottage[27].

The hint by Thomas Hale in 1756 that the seed obtained from Holland was not always the same was elaborated by the Rev. W. L. Rham, himself a Dutchman who had settled in England. *Brassica campestris* and *Brassica napus* were often confounded in Britain as rape. In the Netherlands, *B. campestris* was sown in summer and transplanted before winter and produced flowers and seed in the following year. *B. napus* was usually sown in spring, ripening its seed the same season[28].

Loudon, too, was emphatic about the distinction between the two plants for rather more botanical reasons. "Rape", he wrote, "is *Brassica Napus*, a biennial plant of the turnip kind with . . . a woody fusiform root hardly fit to be eaten", that is, the wild rape of Palladius. Von Thaer and Candolle both agree, he said, that the French or Flemish colza was a different plant from our rape, more of the cabbage kind, having a cylindrical root, cut leaves and greater hardiness. According to these authorities, it was *Brassica campestris oleifera* and the seeds produced more oil, in the ratio 955 : 700. For leaves as sheep feed and for oil this had been cultivated from time immemorial. He elaborates its use as winter forage cut green, the oil-producing qualities of its seed and the use of the residual cake for fattening livestock, and manure.

All these uses continued to be advised by the nineteenth-century didactic writers. Sussex farmers occupying 200 or 300 acres were told to sow one-tenth of their acreage to rape (*B. napus*). Sown at the latter end of May, it could be stocked about six weeks later, and would fatten and finish great quantities of sheep and lambs until near Michaelma It would then stand the winter on land not too we The following year it should be left to stand for see to make it profitable. The yield was estimated about forty bushels an acre, and the price as rath better than wheat. The profit was all the great because the cost of seed and tillage was repaid b the sheep feed. The haulm could be fed to catt and the stover after threshing used as hay. Th cake could be used as manure[30].

During the first decade of the Royal Agricultur Society many essays on this crop appeared in it *Journal*[31]. These and the references in other societie publications and the general agricultural pre indicate a widespread interest in the crop.

Most rape grown in the second half of the nin teenth century was for feed—not for seed. On th chalk and oolite, rape was often grown mixed wit vetches and turnips about 1880, but most frequentl by itself. *Brassica campestris* described by R. Scot Burn as smooth-leaved summer rape, or colza, wa suited to fen soils rich in peaty matter; *Brassic napus*, the rough-leaved winter rape or cole-seed, t clay soils. Some farmers were uneconomical enoug to burn the haulm; but this was a mistake. It mad excellent litter.

The methods of cultivation and manuring had no changed; but some farmers grew a succession o fields or patches of rape throughout the season beginning with one in April for late summer an autumn feed. The main crop was put in during June and more small areas at intervals for a few weeks This method provided a succession of growths tha could be used during winter and spring. Some continued the old practice of feeding off in autumn an letting the crop stand until the following year. It was then folded or fed green once more; but thi second growth was watery and innutritious[32].

The winter variety, still a main crop, yielded heavily on the rich fen soils in 1914. The ancient idea that neglected turnips and swedes were liable to lose their large and shapely roots and to revert, the swede to the smooth-leaved summer rape, the turnip to the rough-leaved winter rape, was then repeated[33].

With the need for economies in stock feeding between the Wars, many farmers expanded their rape acreage. The need for home-grown feed was intensified by the Second World War; the acreage under rape trebled, though it was not a major crop. In England and Wales some 52,000 acres was grown in 1935; 150,096 in 1944.

All this was grown for feed. The seed required for oil is imported; 13,419 tons during 1953 to make 4,697 tons of oil. This is not new. The quantities were 206,111 quarters in 1865; 474,667 quarters in 1866; 610,782 quarters in 1867. An experiment in making oil with home-grown seed in 1951 was not economic, insufficient oil being extracted to make seed-growing pay. In spite of this, it looks as if rape will continue to contribute substantially to feeding our livestock.

One of the main uses of the oil produced by the French, Flemish and Dutch refugees, both in their native countries and the reclaimed fens, was lighting. Condemned as it was by the irate fenmen, it provided better light than rushlights or tallow candles. Indeed, it competed with whale oil if the couplet:

"Here grows proud rape, whose price and plenty foyles
The Greenland trade and checks the Spanish oyles"

to be believed. In the early railway age it supplied ailway lamps, and later some used it in bicycle amps. In some backward countries it is still used s an illuminant. Some Asiatics cook and make margarine with it; but here and in the United States its use is for quenching steel and as a machine ubricant.

The plant, always grown more in France, Belgium, Holland and Germany than here, is to-day almost orld-wide, being grown in Hungary and the U.S.S.R., n China and India as well[34]. Here rape is now grown only for feed. Its cultivation undoubtedly owes much to the 'Dutch' settlers and to the continual reference to Low Countries' practice made in our arming text-books throughout the first two centuries f its adoption. The long-sustained trade in imported seed from Flanders and Holland, so rigidly insisted upon by a succession of writers, has helped to keep p the excellence of the crop.

# MAN-MADE DIAMONDS

By Drs. F. P. BUNDY, H. T. HALL, H. M. STRONG and R. H. WENTORF, Jun.

Research Laboratory, General Electric Company, Schenectady, New York

IN the 1920's it was quite widely believed that diamond had been made from carbon under conditions of high heat and great pressure. The story was indeed one to capture the imagination. It involved famous chemists, a thoroughly fascinating subject and very striking experimental techniques.

In the recent past, however, informed scientists soberly agree that there has been no certain example of diamond production in the laboratory. More than a century of claims and counterclaims for the synthesis of diamond attest to the fascination of the subject and the extreme difficulty of the experimental techniques. Henri Moissan dissolved sugar charcoal in molten iron and quenched the solution in cold water in order to crystallize the carbon under the great internal pressure supposedly generated by contraction as the mass cooled from the outside. When the metal was dissolved from the solidified melt, there remained traces of transparent material having optical properties similar to those of diamond and giving some carbon dioxide upon combustion. Moissan therefore believed he had made diamond.

In 1880, J. B. Hannay reported he had made diamonds by heating a mixture of hydrocarbons, bone oil and lithium at red heat in sealed wrought-iron tubes. The project was said to be fraught with great difficulty because of exploding tubes; only three out of eighty held. Hannay's identification of his diamonds seemed very conclusive, since it even included a density of 3·5 and a carbon analysis of 97·85 per cent.

Sir Charles Parsons tried for thirty years to synthesize diamonds, including in his experiments many attempts to duplicate the work of Moissan and Hannay. At first Parsons thought he had succeeded; but later, having some doubts, he scrupulously re-investigated all his work on the subject. Parsons's new work clearly demonstrated how he had been misled into regarding as diamond various transparent, singly refracting minerals (spinels) which were very resistant to chemical reagents and would not burn. He finally concluded that neither he nor anyone else had ever succeeded in making diamonds in the laboratory.

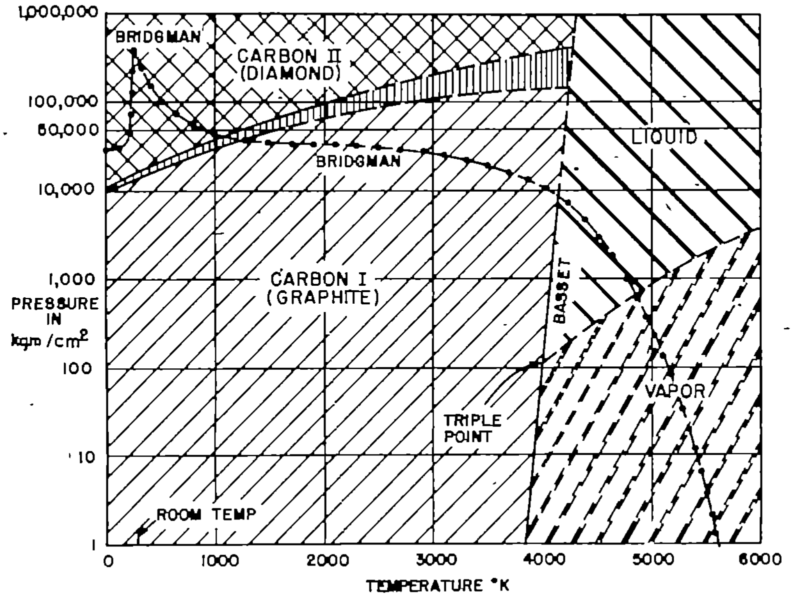

Fig. 1. Phase diagram of carbon

The early claims to diamond synthesis were again reviewed by Prof. N. V. Sidgwick, of Oxford, in 1950, and Henry Eyring, of the University of Utah, in 1952. These authorities conclude that the synthesis of diamond in the laboratory has never been shown to be a success, and that thermodynamic considerations make it seem improbable that diamonds could have been formed under the conditions used in the experiments reported.

For a full account of the arguments the reader is referred to an extensive literature on the subject, a bibliography[1–24] for which is appended.

## Suggestions from Thermodynamics

The phase diagram for carbon as now understood is plotted in Fig. 1. Only the boundary between graphite and its vapour at low pressure is accurately established by experimental measurements. The boundaries at higher pressures between graphite, vapour and liquid are based on the work of Basset, and are not fully accepted.

The location of the boundary between the graphite and diamond-stable regions has very little direct experimental evidence at present. The position of the lower temperature part of this boundary was calculated by thermodynamic methods by Rossini and Jessup[15] of the U.S. Bureau of Standards in 1938. The higher temperature part of the boundary shown by broken lines is purely extrapolated from the other part, as the physical data have never been obtained.

The chain-line running across the diagram shows the upper limits of pressure and temperature that are known to have been reached in controlled experiments (this excludes atom bombs) according to the published literature. Prof. P. W. Bridgman, of Harvard University, is the outstanding investigator in this field, working up to more than 400,000 atmospheres at room temperature. He also held temperatures near 3,000° K. at 30,000 kgm./cm.² for very short intervals of time.

The diagram shows that Bridgman has operated well up into the diamond-stable region and has tried many times to synthesi diamonds but without success. H has stated in several of his pape that the reason for his lack success is that at the relative low temperatures at which his e periments were carried out th rates of reaction were negligib He recognized the necessity going to higher temperatures; b he had not developed apparat capable of operating at these hi pressures and temperatures simu taneously. The maximum co ditions he has reported in th direction were 30,000 kgm./cm.² a 2,200°–3,000° K. for periods of o or two seconds.

Bridgman[19] attempted to esta lish a point on the diamond–graphit equilibrium curve in a series of e periments in which diamonds we heated to about 2,500° K. for a fe seconds at pressures which we increased until the diamonds faile to graphitize. This pressure wa reached at 30,000 kgm./cm.². H suggested in his paper that this point, 30,00 kgm./cm.² and 2,500° K., might lie near the diamond graphite equilibrium curve.

In Bridgman's experiment the possibility tha pressure reduced the rate of conversion of diamon to graphite cannot be ruled out. If so, the diamond would fail to graphitize at 30,000 kgm./cm.² in th few seconds at high temperature available. If this b the case, the point 30,000 kgm./cm.² and 2,500° K is still within the graphite region of stability.

The known evidence about the thermodynami stability for diamond and graphite led us to believ that diamonds could be formed in the pressure regio 30,000–100,000 kgm./cm.² at temperatures somewhere in the range of 1,000°–3,000° K.

## Pressure Vessels

Practically all known ultra-high-pressure generator are based on the principle of pushing a piston into a cylinder that encloses the substance to be subjecte

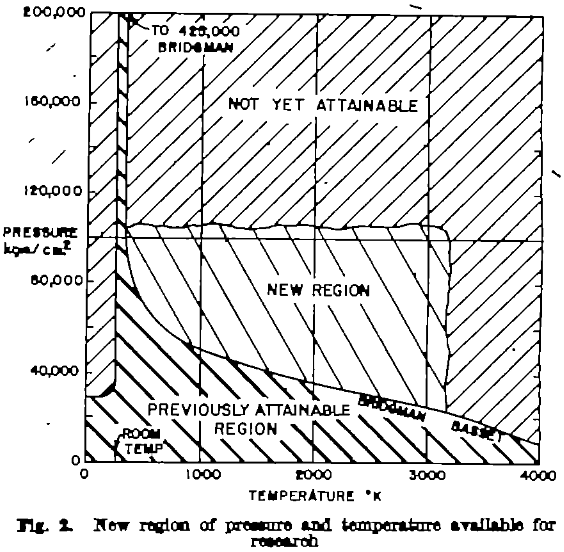

Fig. 2. New region of pressure and temperature available for research

o the pressure. The main factor which limits the maximum pressures hat can be reached within vessels is the strength of materials. The trongest steels in the most favourable form and size (piano wire, for example) have ultimate tensile strengths of the order of 14,000–21,000 kgm./cm.$^2$. Sintered carbides, such as 'Carboloy', have compressive strengths of the order of 50,000 kgm./cm.$^2$ or more. The pressure required for reasonably rapid synthesis of diamond was thought by our group to be above the compressive strength of 'Carboloy' in the range 50,000–100,000 kgm./cm.$^2$.

Merely making the walls thicker on a pressure vessel contributes very little to its pressure-holding ability after a certain wall thickness is reached. By using multiple support bands on the cylinder part (a technique used years ago in making large gun barrels), and special sealing gasket devices between

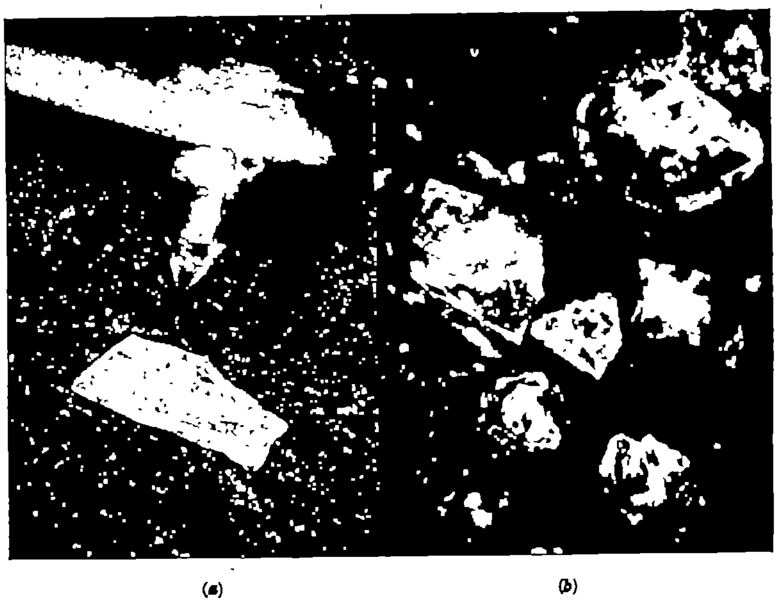

Fig. 3. Man-made diamonds. (a) 1-mm. diamond shown with phonograph needle. (b) 0·2–0·5-mm. octahedra

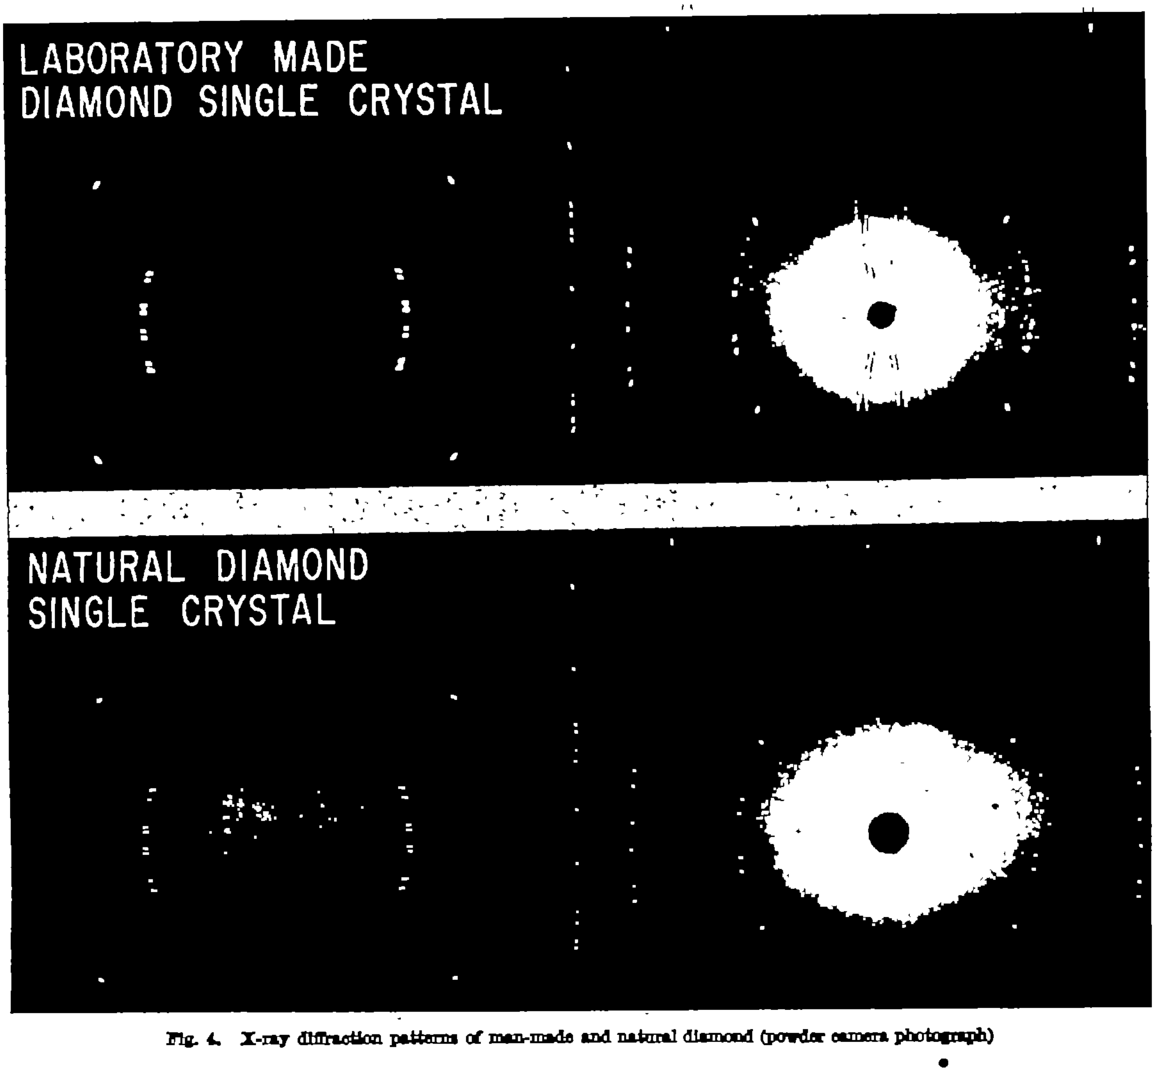

Fig. 4. X-ray diffraction patterns of man-made and natural diamond (powder camera photograph)

the piston and cylinder, Bridgman had developed pressure vessels good for 50,000 kgm./cm.$^2$ at room temperature. At high temperatures, materials get weaker and in general the attainable pressures are lower.

By developing some new ways of distributing stress and giving support to critical parts, our research group has succeeded in developing pressure vessels that operate at pressures up to at least 100,000 kgm./cm.$^2$ and temperatures in excess of 2,800° K. for hours of continuous operation.

## Calibration of Pressures and Temperatures

Pressures of this magnitude are calibrated by making use of four of the electrical resistance transitions observed by P. W. Bridgman[16] in the pressure region up to 80,000 kgm./cm.$^2$. The transitions are bismuth 25,400, thallium 45,000, cæsium 55,000 and barium at 80,000 kgm./cm.$^2$. For pressures greater than 80,000 kgm./cm.$^2$, the melting point of germanium as a function of pressure was used. It was found to decrease linearly with pressure to press loads corresponding to 100,000 kgm./cm.$^2$.

Temperatures inside the pressure cells are measured by use of thermocouples, melting points of materials, change of electrical resistance of wires, Curie points of magnetic materials, thermocolour paints, etc.

## Region now Available for Research

In Fig. 2 appears a pressure–temperature diagram, with linear scales on both axes, showing the new region of exploratory research which has been opened up by the development of our new high-pressure and high-temperature apparatus. Note that the newly attainable region covers about as much area as does all the region previously attainable.

## Diamond Synthesis

The new region of attainable pressure and temperature extended well into the diamond-stable region as defined in Fig. 1. Under these supposed diamond-stable conditions, processes were discovered which yielded diamonds ranging in size from less than 100 microns to more than 1 mm. along an edge. The various processes have been independently repeated more than one hundred times by a number of workers in this Company. Each time crystals were grown which pass the critical tests for identification with diamond. The present chamber sizes permit the synthesis of up to about ¼ carat of diamond material.

It is not necessary to introduce diamond seeds. Nucleation and growth occur spontaneously and profusely when diamond-stable conditions are reached. In some of the early successful work, diamond seeds were added; but growth occurred independently and apart from the added seed. In a few cases under special conditions, some growth has occurred on the seed crystals.

The man-made diamonds form in many of the different crystal habits found in Nature. These include octahedra, tetrahedra and dodecahedra. Some typical forms are shown in Fig. 3.

## Proof that Diamonds were Made

The proof that diamonds were made was based on the following conclusive tests:

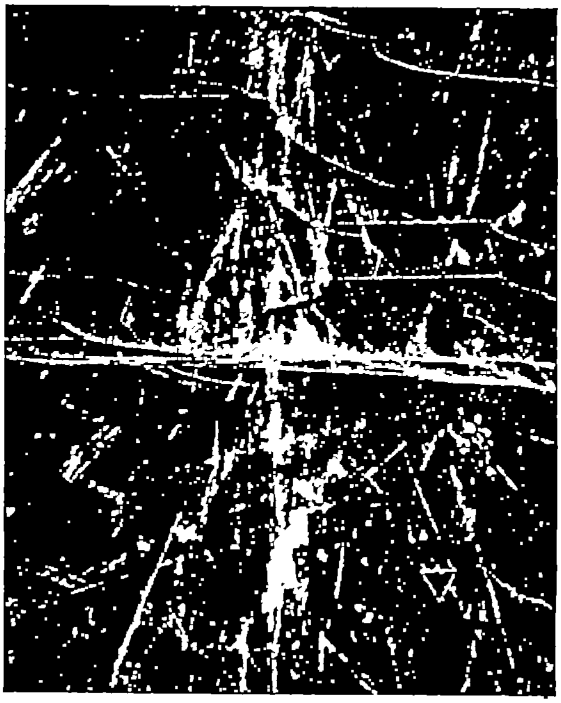

Fig. 5. Scratches made on natural diamond 111 face with man-made diamonds. A large number of scratches appear in a generally vertical direction down through the centre of the picture. The horizontal marks are growth steps on the crystal face. The triangular pit in the lower right-hand corner is also a typical growth mark found on diamond faces

(1) Identity of crystal structure of man-made diamonds to natural diamonds as determined by X-ray diffraction patterns (Fig. 4).

(2) Chemical analysis to show that crystals made were composed of carbon. Those analysed were 86 per cent carbon, 14 per cent inorganic ash identified with the growing media.

(3) Hardness tests. The laboratory-made diamonds were hard enough to scratch the hardest face, the 111 face, of natural diamond (Fig. 5).

(4) Repeatability. The synthesis of diamond has been repeated, entirely independently, by a number of workers in the General Electric Company. The diamonds so made pass the above conclusive tests for diamonds.

In addition, it was shown that the index of refraction for the man-made crystals was within the range 2·40–2·50. Mineral compilations[17] list five isotropic minerals having a refractive index near this range. Natural diamond is one of them and its value is 2·419. The other four are:

| | Index of refraction | Mohs' hardness |
|---|---|---|
| Franklinite, (Zn,Fe,Mn)O·(Fe,Mn)$_2$O$_3$ | 2·36± | 6 |
| Perovskite, CaO·TiO$_2$ | 2·38± | 5·5 |
| Sphalerite, (Zn,Fe)S | 2·428 | 3·5–4 |
| Eglestonite, Hg$_2$Cl$_2$.Hg$_2$O | 2·49± | 2·3 |

These four are ruled out as possibilities by the other critical tests.

The result of more than four years effort in this laboratory has been the development of equipment capable of holding pressures and temperatures in the diamond-stable region for hours at a time. Synthesis of diamond has been accomplished more than a hundred times. A number of people have independently repeated the various diamond-making processes successfully. These laboratory-made diamonds can scratch natural diamonds and have a crystal structure identical with natural diamonds.

# NEWS and VIEWS

## The Astronomer Royal:

### Sir Harold Spencer Jones, K.B.E., F.R.S.

SIR HAROLD SPENCER JONES, Astronomer Royal at the Royal Greenwich Observatory, will retire on December 31. Sir Harold has had a long and distinguished career as an astronomer. Isaac Newton Student and Smith's Prizeman at Cambridge, chief assistant at the Royal Observatory during 1913–23, H.M. Astronomer at the Cape during 1923–33, and Astronomer Royal since 1933, he has left his mark on each of the institutions which he has served. His record of achievement at the Cape can only be compared with that of Sir David Gill; by their efforts and under their leadership the Cape Observatory was made a leading centre of astronomy. The tenth Astronomer Royal will always be associated with the move of the Royal Observatory from Greenwich to Herstmonceux. Conditions at Greenwich have been such that the observing instruments could with advantage have been moved half a century ago; but it required boldness to consider a move of the whole establishment to the scientific isolation of Herstmonceux. The numerous difficulties associated with this move, aggravated by post-war conditions, are known in detail only to the Astronomer Royal himself; but it is clear that they, and his far too numerous official duties outside the Observatory, have imposed an almost intolerable burden. He must be looking forward to the freedom to resume his own scientific work on the fundamental astronomical constants, just as astronomers everywhere will be looking forward to the results of this work.

### Prof. R. v. d. R. Woolley, O.B.E., F.R.S.

BRITISH astronomy is fortunate in the choice of Prof. R. v. d. R. Woolley as the eleventh Astronomer Royal. His researches on fluorescence and non-coherence in the formation of absorption lines, his investigation of convection in the solar photosphere and, with Allen, of the physical conditions in the solar chromosphere, have made him one of the leading authorities in astrophysics. As chief assistant at Greenwich during 1933–37 he became well acquainted with the older branches of astronomy and had the imagination to see how the equipment there could be used with advantage in the re-measurement of physical double stars. His skill in research is matched by his success as an organizer and administrator. Under his direction the Commonwealth Observatory at Canberra has become one of the leading observatories in the world. While carrying his own research into new fields, he has at the same time attracted and inspired a strong group of workers, and has provided modern equipment including a 74-in. reflecting telescope now in course of erection. He has been successful in securing co-operation with American astronomers, so that not only is there an active exchange between Canberra and the Pacific Coast observatories, but also the Yale–Columbia Station has been moved to Mount Stromlo.

Prof. Woolley goes to the Royal Greenwich Observatory at a critical period. The past fifty years have witnessed a dramatic revolution in astronomical knowledge and in the techniques of observation, much of it initiated on the American continent. In the same period, Greenwich has continued conscientiously to amass observations, though often with obsolescent equipment and methods and on programmes some of which stem from Airy. It is right and proper that the older methods and problems should not be lightly abandoned; but the time is more than ripe for a fundamental re-assessment of the functions of the Royal Observatory, its equipment and method of staffing.

## College of Aeronautics: Principal A. J. Murphy

PROF. A. J. MURPHY has been appointed principal of the College of Aeronautics, Cranfield, as from October 1. Prof. Murphy graduated at the University of Manchester with first-class honours in chemistry and later was awarded an M.Sc. of the same University. After a period as research assistant to Prof. C. A. Edwards in the Metallurgy Department at University College, Swansea, and later on the staff of the Metallurgy Department at the National Physical Laboratory, in 1931 he joined the firm of J. Stone and Co., Ltd., as chief metallurgist, and in 1946 became a director of that Company and also of Light-Metal Forgings, Ltd., and chairman of Stone-Fry Magnesium, Ltd. For the past five years Prof. Murphy has been professor of industrial metallurgy in the University of Birmingham, and, since 1953, director of the Departments of Physical Metallurgy and Industrial Metallurgy. He is a past-president of the Institute of Metals, and for the past six years has been chairman of the Inter-Services Metallurgical Council, and is also a member of a number of research associations and committees, including committees of the Aeronautical Research Council.

## Gold Medal of the Institute of Navigation: Captain P. van H. Weems

The Gold Medal for 1955 of the Institute of Navigation has been awarded to Captain P. van H. Weems, of the United States Navy (retired), for "his outstanding contributions to the general advancement of air and surface navigation over a period of more than thirty years". Captain Weems's "Star Altitude Curves" are still, after nearly thirty years, the leading form of graphical presentation of star data, and used in conjunction with a second-setting navigational watch, preferably adjusted to keep sidereal time, they provide the quickest way to a navigational fix. By his efforts the Greenwich hour angle, which he advocated as long ago as 1928, was eventually adopted for both air and surface navigation and is now a standard feature of most nautical almanacs. His text-book on "Air Navigation", which was first published in 1931, was awarded the Gold Medal of the Aero Club of France, and he has also written a standard text-book on marine navigation. These three examples represent only a small part of Captain Weems's contributions to a subject which has been, and still is, his life's work; but they serve to show his worthiness to receive the premier British award in the field of navigation.

## Royal Society of Edinburgh: Honorary Fellows

The following have been elected Honorary Fellows of the Royal Society of Edinburgh: Prof. Giorgio Abetti, formerly director of the Astrophysical Observatory, Arcetri, Florence; the Abbé Henri Breuil, prehistorian and archæologist, formerly of the Collège de France, Paris; Prof. L. E. J. Brouwer, Department of Mathematics, University of Amsterdam; Dr. Anton Bruun, University Zoological Museum, Copenhagen; Prof. M. Florkin, Biochemical Laboratories, University of Liège; Prof. N. E. Svedelius, Department of Botany, University of Uppsala; Prof. H. Yukawa, Department of Physics, University of Kyoto.

## Committee on Colonial Road Research

After consultation with the Department of Scientific and Industrial Research, the Secretary of State for the Colonies has appointed a committee to advise on matters of road research for the benefit of the Colonies. Dr. W. H. Glanville, director of road research, will be chairman, and the United Kingdom membership is as follows: Sir George Burt (Messrs. J. Mowlem and Co., Ltd.); Mr. R. L. Fitt (Sir Alexander Gibb and Partners); Mr. G. H. Hargreaves, deputy chief engineer (civil), Ministry of Transport and Civil Aviation; Mr. R. U. Law (Messrs. George Wimpey and Co., Ltd.); Mr. S. Mehew (Derbyshire County Council); Mr. F. W. Parker (Frederick Parker, Ltd.); Mr. J. L. Phipps (Bitumen Department, Shell Co.); Mr. J. Rawlinson (London County Council); Mr. R. W. Taylor (Crown Agents for Oversea Governments and Administrations); Prof. Gilbert Walker, Faculty of Commerce and Social Science, University of Birmingham; Sir Hubert Walker (Colonial Office); Mr. F. H. P. Williams, Colonial Road Research Liaison Officer, Road Research Laboratory (*ex officio* member). Representatives of Colonial Governments will also serve as members of the Committee.

Colonial Governments have indicated support for the establishment of a Colonial Road Research Section at the Road Research Laboratory to deal full-time with road problems peculiar to tropical and rapidly developing Colonial territories. A Colonial Development and Welfare Research grant has accordingly been made providing funds to meet the cost of the establishment and maintenance of the Section during the financial years 1955–57. Staff for the Section is being recruited, and it is hoped to commence work shortly.

## *Virology*

With the appearance of a new journal, *Virology* (pp. 140. New York: Academic Press, Inc.; 9 dollars per vol.), this useful, but ugly, word of doubtful parentage presumably takes its place as the official designation of the study of viruses. The journal has an impressive editorial board consisting of an editor-in-chief, two editors, and twenty associate editors. Among them are most of the leading virologists of the day; but it is, perhaps, a pity, if it is to be an international journal, that no European plant virologists are included. This new journal is to be welcomed for two reasons: first, since it deals with all viruses, it tends to counteract an unfortunate tendency to keep the different types of viruses in water-tight compartments and to regard plant viruses as something entirely unrelated to animal viruses; secondly, it will help to bring together the many contributions which, at present, owing partly to the extensive background of virus research, are widely scattered in journals often quite unconnected with the study of viruses. It is another step towards the building up of a separate status for the science of virology. The contents of the first number indicate the scope of the journal; there are three papers on plant viruses, three on virus diseases of the higher animals, and three dealing with bacteriophages and cognate subjects. The printing and appearance are of the high standard which we associate with the publications of the Academic Press. There is little doubt that *Virology* fills a definite gap in the literature of the subject, and we wish it every success.

## *Country-side*

To mark the golden jubilee of *Country-side*, the journal of the British Naturalists' Association, it is fitting that special tributes should be paid to the founder, E. Kay Robinson, and to Richard Morse. The journal first appeared in May 1905 as a penny weekly, and, despite vicissitudes, has regularly appeared since that time despite all the difficulties caused by war and lack of finance. Richard Morse took over the editorship in 1928 and has only recently given it up; he has been the main cause of its growth into the substantial journal it now is. Besides tributes, the jubilee number contains articles by H. N. Southern on British mammals; C. B. Williams on phenology; M. B. B. Heath on the night skies of summer; and Bernard C. Pickard on British grasshoppers and crickets. There are also a number of shorter sections describing recent observations by naturalists.

### Collected Papers of the Rowett Research Institute

As already noted (*Nature*, 173, 1124; 1954), summaries of the collected papers of the Rowett Institute became available last year for general distribution, beginning with the volume for 1953. The volume for 1954 has now been published as "Rowett Research Institute: Collected Papers, Summary and Subject Reviews", Vol. 11 (pp. 44, obtainable from the Reid Library, Rowett Research Institute, Bucksburn, Aberdeenshire; 5*s*.). The larger number of papers, seventy-six in 1954 against sixty-seven in the year before, reflects the growth of the Institute. The scope and diversity of its problems may be gauged from the following sub-titles of the summary, again written by the director, Dr. D. P. Cuthbertson: methods; microbiology of digestion; absorption; movements of ruminant stomach; animal behaviour; imbalance of nutrients; bracken poisoning; experimental liver necrosis; metabolism of fat; pig research; lactation; economies in feeding non-ruminants; man; reviews and general articles. There are two welcome innovations in the current volume: the titles in the list of papers are given cross-references to the relevant pages of the summary; and the volume carries two subject reviews covering several years of work on two important aspects of the Institute's research. One of the reviews, by Dr. A. T. Phillipson, is on absorption from the alimentary tract of sheep, and the other, which is by the staffs of the Applied and Farm Nutrition Departments, deals with the practical problem of winter keep. The publication will be welcomed not only by agriculturalists but also by many interested in the fundamental aspects of animal nutrition.

### Use of Fibrenyle

Mr. B. H. Newman, of the British Museum (Natural History), has recently described the use of fibrenyle in the preparation of palæontological specimens (*Mus. J.*, June 1955). In the alvar of 1930, a vinyl resin was used for repairing fossils. Later, asbestos fibres were mixed with the alvar and an exceedingly strong and resilient adhesive was obtained. Fibrenyle, a nylon–fibrous thermoplastic which is manufactured as a sheeting or in the form of a dough, has advantages over both the materials mentioned. The dough is dark brown, easily workable, and is soluble in acetone or industrial methylated spirit. The advantages of using this new material are that it can be obtained ready for use, the joint can be finished and made good with fibrenyle at the time of repair, its colour is in harmony with many fossils and it is light in weight.

### Social Medicine at Oxford

Referring to the review of "The Meaning of Social Medicine" (*Nature*, June 11, p. 1011), in which the reviewer wrote: "but when he [Prof. J. Ryle] died social medicine languished in the University [Oxford]", Dr. Roy M. Acheson writes: "Although it is true that the University's interest in it languished, the subject itself has continued to thrive. Since the Institute was finally closed in 1953 a small and extremely active department has continued without interruption. This department has consisted of a reader and a statistician as its sole University staff. They have been assisted by a physician on the permanent strength of the Medical Research Council, and a few other medically qualified research workers who have been employed on a temporary or part-time basis when funds from outside sources have permitted. With these meagre resources, an analysis of war-time civilian medical boards and of the Child Health Survey, two major studies which were begun before 1953, have been completed and the results published as a series of communications in the medical journals. New work has been undertaken on problems connected with old age, infant morbidity and mortality, tuberculosis in industry and acute leukæmia in childhood, and some of these new studies also have reached fruition. Finally, in the course of the past two months, papers have been read on two different aspects of the research of the department to the Royal Society of Medicine and to the Association of Physicians of Great Britain and Ireland".

### University of London

The following appointments in the University of London have been announced: Prof. D. P. Craig, professor of physical chemistry in the University of Sydney, to the University chair of chemistry with special reference to theoretical chemistry tenable at University College; Dr. B. G. Peters, senior principal scientific officer at Rothamsted Experimental Station, to the University chair of parasitology tenable at the Imperial College of Science and Technology; Dr. E. A. R. Braude, reader in organic chemistry in the Imperial College of Science and Technology, to the University chair of organic chemistry tenable at that College; Mr. G. Keith Allen, to the University readership in mining tenable at the Imperial College of Science and Technology; Dr. J. H. Burgoyne, senior lecturer in the Imperial College of Science and Technology, to the University readership in chemical engineering tenable at that College; Dr. G. L. Kingston, lecturer in physical chemistry in the University of Aberdeen, to the University readership in physical chemistry tenable at the Imperial College of Science and Technology; Dr. J. S. Webb, lecturer in mining geology at the Imperial College of Science and Technology, to the University readership in applied geochemistry tenable at that College.

### The Queen's University of Belfast

The Queen's University of Belfast has received the following grants: from the Rockefeller Foundation, 21,000 dollars over two years for the purchase of research equipment for use in the Department of Microbiology; from Imperial Chemical Industries, Ltd., £300 for three years to support work on heterogeneous catalysis; from Messrs. Gallaher, Ltd., £300 per annum under covenant to support work in the Department of Chemistry; from the Aliphatic Research Co., Ltd., £285 per annum for a research studentship in organic chemistry, together with expenses of special chemicals and equipment; from the Royal Society, £580 to support research in mathematics.

Robert E. H. Reid has been appointed to a lectureship in geology.

### The Australian National University, Canberra

Dr. I. F. Wright, of the Department of Natural Philosophy, University of Glasgow, has been appointed a research fellow in the Australian National University, Canberra, and will work in the Department of Nuclear Physics with Prof. E. W. Titterton. A visitor to the Department during

August 1955–August 1956 will be Prof. J. B. Warren, of the University of British Columbia, Vancouver.

In addition to 600-keV. and 1,250-keV. Cockcroft–Walton accelerators which have been in operation for some time, the 33 MeV.-electron synchrotron, originally installed at the Atomic Energy Research Establishment, Harwell, and which was moved to Canberra last year, has recently been brought into operation.

## Royal Commission for the Exhibition of 1851: Awards for 1955

THE Royal Commission for the Exhibition of 1851 has awarded senior studentships for 1955 (value £600–650 a year for two years) to the following for research at the universities indicated: A. D. Buckingham (Sydney), theoretical chemistry at Cambridge; H. E. Hall (Cambridge), physics at Cambridge; J. G. Hughes (Wales), botany at Cambridge; B. G. Forbes (Adelaide), geology at Durham. The Commission has also awarded the following overseas scholarships for 1955 (value £450–500 a year for two years). Canada: G. R. Freeman (Saskatchewan), physical chemistry at Oxford. Australia: J. W. G. Wignall (Melbourne), physics at Cambridge; Miss P. J. Hextall and R. F. C. Brown (Sydney), organic chemistry at Cambridge. New Zealand: R. G. Kulka (New Zealand), biochemistry at Oxford; J. B. Waterhouse (New Zealand), geology at Cambridge. South Africa: Miss E. M. Stephen (Witwatersrand), organic chemistry at the Imperial College of Science and Technology, London. Republic of Ireland: W. Hayes (Ireland), physics at Oxford. Republic of India: D. Premaswarup (Andhra), physics at Oxford. Pakistan: M. M. Khuda (Dacca), organic chemistry at the Imperial College of Science and Technology, London.

## Fourteenth International Congress of Pure and Applied Chemistry, Zurich

THE Fourteenth International Congress of Pure and Applied Chemistry will be held during July 21–27 in the Swiss Federal Institute of Technology, Zurich, under the presidency of Prof. P. Karrer, of the University of Zurich. In addition, the International Union of Pure and Applied Chemistry will hold its eighteenth conference during July 20–28. The Congress will deal with organic chemistry only, and the scientific programme consists essentially of five Congress lectures, nine section lectures divided between the three sections, and six hundred papers divided between the ten groups. The five Congress lectures will be as follows: Prof. V. du Vigneaud (Cornell University, New York), "Isolation, Structure and Synthesis of Oxytocin, the Principal Oxytocic Hormone of the Posterior Pituitary Gland"; Prof. C. Dufraisse (Collège de France, Paris), "La Photooxydation"; Prof. N. A. Nesmeyanow (Moscow Academy of Sciences), "Zweifache Reaktionsfähigkeit und Tautomerie"; Prof. C. K. Ingold (University College of London), "Developments in the Theory of Steric Hindrance"; Prof. K. Alder (University of Cologne), "Neuere Entwicklung der Dien-Synthese". The three sections will deal with, respectively: theoretical and physical organic chemistry; natural products; and synthetic, industrial and analytical organic chemistry. The ten groups are lettered *A–K* and cover the following topics: *A*, *B*, *C*, molecular structure, stereochemistry and reaction mechanisms; *D*, amino-acids, peptides, proteins, alkaloids and carbohydrates; *E*, *F*, *G*, aliphatic, alicyclic, aromatic and heterocyclic compounds (terpenes and steroids included) *H*, *J*, dyestuffs, high polymers and other syntheti organic compounds; and *K*, biological and medica chemistry, and analytical chemistry. Abstracts o the papers are being published in a special handbook which will be available at the Congress. The Congres and section lectures will be published in a specia autumn supplement (No. 2) of *Experientia* (subscription price, 26 francs; subsequent price, 32 francs) obtainable from Verlag Birkhäuser, Basle. Alternatively, the supplement can be ordered through the Secretary-General of the Fourteenth Internationa Congress of Pure and Applied Chemistry, Zurich 1 from whom further information on all other matter relating to the Congress can be obtained.

## Announcements

PROF. ARTHUR HOLMES, regius professor of geology in the University of Edinburgh, has been elected a foreign associate of the Paris Academy of Sciences.

SIR ARNOLD PLANT, Sir Ernest Cassel professor of commerce at the London School of Economics, has been appointed chairman of the Colonial Social Science Research Council in succession to Sir David Hughes Parry. Sir Arnold Plant is already a member of the Colonial Research Council, and has been chairman of the Colonial Economic Research Committee since 1945.

THE Seventh British Mathematical Colloquium will be held in Exeter during September 6–8. Those wishing to attend, who have not already registered as members, should write as soon as possible to the Organizing Secretary of the Colloquium at the University College of the South-West, Exeter, from whom further information can be obtained.

THE 1955 Biennial Exhibition of the School Nature Study Union will be held at Morley College, Westminster Bridge Road, S.E.1, on July 9, from 10 a.m. until 6 p.m. A variety of exhibits will cover the work of schools, training colleges, dealers, publishers, individuals and organizations interested in various aspects of biology. Further information can be obtained from the hon. exhibition secretary, Raymond Rivers, 12 Hillcote Avenue, Norbury, London, S.W.16.

THE Oliver Memorial Fund is offering an award of £50 to a British subject for original work or services in connexion with the research, organization or donor aspects of blood transfusion. Applications or information directing attention to suitable candidates must be submitted before August 31 to the honorary treasurer of the Fund, F. W. Mills, c/o National Provincial Bank, Ltd., Holborn Circus, London, E.C.1.

DURING June 1954 a conference of those interested in the conservation and protection of Nature in the Near East was arranged in Beirut and was attended by about fifty people from a number of countries in the Near East (see *Nature*, **174**, 289; 1954). The Proceedings, which have now been published by Unesco, include not only copies of the papers which were read but also full accounts of the subsequent discussions, as well as reports from the different study groups. It is printed in French and English.

ERRATUM. In *Nature* of July 2, p. 16, in announcing the award of the Manley–Bendall Prize, Dr. J. N. Carruthers is referred to as director of the National Institute of Oceanography; this is incorrect, Dr. Carruthers being assistant director of the Institute.

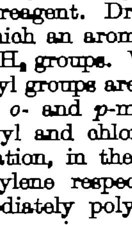
# ORGANO-METALLIC COMPOUNDS

THE symposium entitled "Organo-Metallic Compounds", which was held in the University of Manchester on April 21, was one of the annual symposia organized jointly by the Chemical Society, the Institute of Petroleum, the Royal Institute of Chemistry and the Society of Chemical Industry. These symposia have become very popular of recent years, and the interest in this year's subject was evident from the attendance of about four hundred members and the liveliness of the discussion. Dr. R. E. Fairbairn and Dr. H. Gudgeon, of the Manchester and District Section of the Royal Institute of Chemistry, are to be congratulated on their arrangement of so successful a meeting. The highlight was the evening lecture by Prof. K. Ziegler, of the Max-Planck-Institut für Kohlenforschung, Mülheim, who described some of the recent advances in the chemistry of organo-aluminium compounds and their important industrial applications, which were discovered in his laboratory.

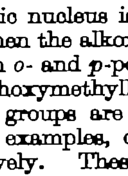
It was auspicious that this symposium should take place in Manchester, where the first professor of chemistry, E. Frankland, prepared the first organo-metallic compound, diethylzinc, just over a hundred years ago. The meeting was opened by Prof. E. R. H. Jones, who was chairman of the morning session; Mr. G. Osgood took the chair in the afternoon, and Sir Robert Robinson in the evening. The subject of the symposium was introduced by Prof. G. E. Coates (University of Durham) with a review of some recent developments in the chemistry of organo-metallic compounds. Although there has been little progress in the elucidation of the structures of the chromium phenyls and lithium alkyls, the realization that the lighter elements tend to use all their low-energy orbitals in forming covalent compounds has helped considerably in the understanding of the chemistry of the organo-metallic compounds of the lighter metals of groups 2 and 3 in the Periodic Table. The utilization of all low-energy orbitals is accomplished by the polymerization of the simple molecules, for example, $(R_2Be)_n$ and $(R_3Al)_2$, or, if suitable donor substances are present, by the formation of co-ordination compounds, for example, $R_3\overset{-}{\mathrm{Al}}\text{—}\overset{+}{\mathrm{N}}R_3$ or $K[BPh_4]$. Sometimes both methods are used together as in a series of compounds $(PMe_3)_2(Me_2Be)_m$ formed by the reaction of $PMe_3$ with $(Me_2Be)_n$. In an enclosed system the value of $m$ increases in a stepwise manner as the temperature is raised. The stabilities of the co-ordination compounds of the alkyls of the group 3 elements indicate that their acceptor properties increase from boron to aluminium, and then decrease regularly to thallium. Only thallium shows any evidence of $d_\pi$—$d_\pi$ bonding such as is found in the complex compounds of the platinum metals. The donor properties of the trimethyls of the group 5 elements in co-ordination to trimethylgallium decrease monotonously from trimethylamine to trimethylbismuthine.

The other extreme in structural type, when $d_\pi$-bonding by the metal is all-important, was next considered by Dr. J. Chatt (Akers Research Laboratories, Imperial Chemical Industries, Ltd.), who discussed the structure of the olefin complexes with metallic salts. He described the structure of the $[C_2H_4PtCl_3]^-$ ion in terms of atomic and molecular orbitals. No simple donation of π-electrons from the olefin to the metal can explain the properties of the stable olefin complexes. A structure was proposed in which the olefin-to-metal bond is a type of double bond. The σ-component of the co-ordinate bond is formed by donation of the π-electrons of the olefin to the metal atom, and the π-type component of the co-ordinate bond by the back donations of an electron pair from a $d$-orbital (or $dp$-hybrid orbital) of the metal atom into the anti-bonding π-molecular orbital of the olefin. It is significant that the only metals known to form stable olefin complexes have all their $d$-orbitals filled and are in low valency states, namely, Cu(I), Pd(II), Ag(I), Pt(II), Hg(II) and, recently added, Rh(I). Some of the more important properties of olefin complexes were described and shown to be consistent with the proposed structure.

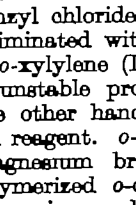
Dr. F. G. Mann (University of Cambridge) concluded the morning session with a paper on new reactions of Grignard reagents and their mechanisms. It is known that many β-substituted alkylhalides, for example, $ROCH_2CH_2X$, react with magnesium to give ethylene, $Mg(OR)_2$ and $MgX_2$, instead of a Grignard reagent. Dr. Mann has studied similar systems in which an aromatic nucleus is interposed between the $CH_2$ groups. When the alkoxymethyl and chloromethyl groups are in *o*- and *p*-positions to each other as in *o*- and *p*-methoxymethylbenzyl chlorides, the alkoxyl and chloro groups are eliminated with the formation, in these examples, of *o*-xylylene (I) and *p*-xylylene respectively. These unstable products immediately polymerize. On the other hand, the *m*-isomer gives a normal Grignard reagent. *o*-Methoxymethylaniline with phenylmagnesium bromide gives a small proportion of polymerized *o*-quinomonomethaneimine (II); but the major product is *o*-benzylaniline. The *p*-isomer behaves similarly; but there is no reaction with the *m*-isomer. The mechanism of these and many related reactions was explained in terms of electron shifts. The reactions are valuable in organic syntheses, especially for the preparation of some simple *o*-substituted benzene derivatives.



(I)



(II)

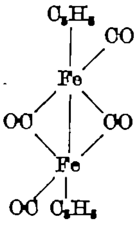


(III)

In the discussion which followed, Dr. G. Baddeley presented evidence that the alkoxyl group is eliminated only if the oxygen atom is free to turn out of the plane of the benzene ring; for example, the $o$-$CH_2$—O bond is not broken by action of magnesium on (III). Prof. Ziegler also mentioned experience of compounds where elimination does not occur; for example, the reaction of magnesium with $(RO)_2CHCH_2Br$ gives the coupled product $((RO)_2CHCH_2)_2$, provided $R$ is butyl or a higher alkyl group. Dr. E. A. Braude and Dr. N. R. Davies also took part in the discussion.

In describing organo-iron compounds, Dr. M. C. Whiting (University of Manchester) discussed some interesting acetylene complexes derived from iron carbonyl, and the analytical difficulties encountered in establishing their composition. Two distinct types of compounds were described. The first was exemplified by the products of the reaction of phenylacetylene with iron carbonyl in the presence of nickel carbonyl. It is a yellow, crystalline and very stable substance $(\text{PhC}{\equiv}\text{C})_2\text{Fe(CO)}_4$ isoelectronic with $\text{Cr(CO)}_6$. The second series was obtained by reaction of acetylenic substances with iron carbonyl hydride. They are acids, for example, $\text{H}_2[\text{Fe}_2(\text{CO})_7\text{CH}_3\text{C}{\equiv}\text{CH}]$; but the structure of the anion is unknown. Probably it is similar to that of the uncharged cobalt complex $[\text{Co}_2(\text{CO})_6R\text{C}{\equiv}\text{C}R]$.

Dr. P. L. Pauson (University of Sheffield) gave a historical review of the development of the chemistry of *biscyclo*pentadienyliron (ferrocene) and analogous compounds of the other transition metals. Of the more interesting reactions recently discovered is that of butyl-lithium to give dilithioferrocene, which has a lithium atom in each *cyclo*pentadienyl ring, and those leading to the synthesis of phenylferrocenes up to octa-phenylferrocene. The carbonyl compounds $\text{C}_5\text{H}_5\text{Fe(CO)}_2\text{Br}$ and $(\text{C}_5\text{H}_5)_2\text{Fe}_2(\text{CO})_4$ were described. An X-ray investigation indicates that the latter has the structure (IV) in which the $\text{C}_5\text{H}_5$ rings are perpendicular to the Fe—Fe bond, and the terminal CO groups perpendicular to the plane of the bridging CO groups.



(IV)

Dr. D. Bryce-Smith (King's College, London) described his investigation of whether free radical intermediates occur in the Wurtz reaction. Wurtz reactions were carried out in the presence of *iso*propylbenzene. Many free radicals react with this compound to form 2 : 3-dimethyl-2 : 3-diphenylbutane by the following reactions :

$$\cdot R\cdot + \text{PhCH(CH}_3)_2 \rightarrow R\text{H} + \text{Ph}\underset{\bullet}{\text{C}}(\text{CH}_3)_2\,;$$

$$2\,\text{Ph}\underset{\bullet}{\text{C}}(\text{CH}_3)_2 \rightarrow \text{PhC(CH}_3)_2\text{—C(CH}_3)_2\text{Ph}$$

The reaction of *n*-butyl iodide with sodium in *iso*propylbenzene gave, in addition to octane, about 1 per cent of 2 : 3-dimethyl-2 : 3-diphenylbutane, and the yield was similar when *n*-butylsodium was used in place of sodium metal. When lithium or *n*-butyllithium reacted with *n*-butyl halides in *iso*propylbenzene, the yields of 2 : 3-dimethyl-2 : 3-diphenylbutane were 15–20 per cent. Octane was also formed. The fact that 2 : 3-dimethyl-2 : 3-diphenylbutane was not formed by the thermal decomposition of alkyllithium, -sodium and -potassium in *iso*propylbenzene solution indicates that free radicals were not produced, contrary to recent suggestions by Morton and Cluff (*J. Amer. Chem. Soc.*, **74**, 4056 (1952); **75**, 134 (1953)). On the other hand, *n*-butyl radicals, generated in *iso*propylbenzene by the photolysis of di-*n*-butylmercury, gave 2 : 3-dimethyl-2 : 3-diphenyl butane in 50 per cent yield, but only traces of octane Although free radicals are formed in Wurtz reactions they probably contribute little to the coupling reaction and are produced in a secondary homolytic reaction between alkyl halide and alkali-metal alkyl

The organic compounds of lithium and their use in synthesis were admirably reviewed by Dr. E. A Braude (Imperial College of Science and Technology London). They offer definite advantages over Grignard reagents. They are more reactive, and their reactions are more free from side reactions, possibly because of the absence of such equilibria as $2R\text{Mg}X \rightleftharpoons R_2\text{Mg} + \text{Mg}X_2$. They are often easier to prepare, and many organic halides—for example, the vinyl compounds $R\text{CH}{=}\text{CHCl}$—which do not give Grignard reagents, yield lithium compounds. The lithium compounds of the vinyl derivatives retain their configuration about the double bond; thus *cis*-$R$CH : CHCl yields *cis*-$R$CH : CHLi. Dr. Braude also described numerous interesting syntheses in the aryl and heterocyclic series of organic compounds where the specific properties of lithium compounds are of especial importance.

It is not possible in the small space available to do justice to Prof. Ziegler's brilliant exposition of his recent researches into the properties of the alkyls of the lighter metals. He first described the pyrolysis of the methyl derivatives of lithium, magnesium and aluminium, then a new series of complex salts formed by aluminium alkyls and finally the use of aluminium alkyls as catalysts in the controlled polymerization of olefins.

The pyrolysis of the heavy-metal alkyls usually gives free alkyl radicals, and of the lighter-metal alkyls, olefins and metal hydrides. The above methyls decompose, however, in neither of these ways. Methane is always a product of the pyrolysis, and in the case of trimethylaluminium a residue of $\text{Al}_4\text{C}_3$ remains. Lithium and magnesium methyls yield acetylides; for example, $2\,\text{LiCH}_3 \rightarrow \text{CH}_4 + \text{Li}_2\text{CH}_2$, and then at higher temperature $3\,\text{Li}_2\text{CH}_2 \rightarrow \text{Li}_2\text{C}_2 + 2\,\text{LiH} + 2\,\text{Li} + \text{CH}_4$. Pyrolysis of such complexes as $\text{LiAlMe}_4$ give mixed carbides, for example, LiAlC.

Four types of complex salts derived from aluminium alkyls were described: $\text{Mg}[\text{Al}R_4]_2$; $R\text{Mg}[\text{Al}R_4]$; $\text{Na}[\text{Al}R_2\text{F}_2]$; and $\text{Na}[\text{Al}R_3\text{F}]$. Salts of the fourth type containing other halogens are stable only in the presence of the larger cations. The first are true salts; but the second do not conduct electricity and may be distilled in high vacuum. The third type, obtained from $R_2\text{AlCl}$ and NaF, decomposes on pyrolysis to give $R_3\text{Al} + \text{Na}_3\text{AlF}_6$, and so provides a method of converting $R_2\text{AlCl}$ into $R_3\text{Al}$.

In the polymerization of ethylene under pressure at 100–110° C. there are two stages: the growth reaction, $\text{al(CH}_2)_n\text{CH}_3 + \text{C}_2\text{H}_4 \rightarrow \text{al(CH}_2)_{n+2}\text{CH}_3$; and the displacement reaction, $\text{al(CH}_2)_n\text{CH}_3 + \text{C}_2\text{H}_4 \rightarrow \text{alCH}_2\text{CH}_3 + \text{CH}_2{=}\text{CH(CH}_2)_{n-2}\text{CH}_3$ (al = $\frac{1}{3}$ Al). The relative rates of these two reactions determine the length of the polymer chain. The displacement reaction is greatly accelerated by traces of colloidal nickel, poisoning of which is inhibited by phenylacetylene. In its presence smooth conversion of ethylene to butene is achieved. Prof. Ziegler also described schemes for the conversion of ethylene to higher *n*-alk-1-enes, and for obtaining *n*-alcohols from ethylene by oxidation and hydrolysis of the products of the growth reaction. His lecture was followed by an interesting discussion.

J. CHATT

# VISCO-ELASTIC BEHAVIOUR

A MEETING of the British Society of Rheology was held during April 29–30 in the Physics Department of King's College, Newcastle upon Tyne. About seventy members and visitors, including some from abroad, met to hear and discuss papers, under the chairmanship of Dr. L. R. G. Treloar, president of the Society.

The flow properties of a system consisting of a mixture of methylmethacrylate and pitch in tar oil were discussed by L. J. Wood and G. Phillips (Coal Tar Research Association). Measurements of viscosity and elastic modulus in the system, and also in one having no polymer added to it, have been made. Both the specific viscosity, defined as the viscosity divided by the retardation time, and the elastic recovery are practically independent of temperature, but markedly dependent on stress. The equilibrium rate of shear and the stress are related by a power law; the apparent viscosity increases as the stress is raised. The elastic recovery can be expressed as $1/e = 1/e_m + b/S$, where $e$ is the elastic recovery, $S$ the stress, $b$ the gradient, and $e_m$ the intercept of the reciprocal recovery/reciprocal stress plot. With increasing polymer concentration from 0 to 2 per cent the value of $e_m$ increases steadily and that of $b$ decreases slightly. Results to date suggest, however, that above this concentration $e_m$ and $b$ remain practically constant.

Dr. A. S. Lodge (Rayon Research Association) outlined a theory of the stresses and birefringence set up in flowing polymer solutions. The deformation of networks is considered to account for most of the viscous stresses observed, and flow birefringence is due to anisotropy of networks. The theory is developed from one which Treloar applied to the rubber-like state and compared with the results of experiments by Signer and by Schmidli.

Dr. K. Weissenberg (Colloid Science Department, Cambridge) demonstrated some interesting experiments, illustrating recent advances in the goniometry of flow, particularly those involving the three-dimensional case of pure shear. For quantitative experiments the material under investigation is contained between two rubber sheets, or within a rubber tube, and the displacements and forces across three mutually perpendicular planes are measured. The conventional technique of testing produced motions of 'simple' laminar shear, and in these the geometry is very complicated because there is a shear-dependent angular deviation between the main axes of the stresses, the strains and their various derivatives in time. The new method of testing resolves this complexity, as it produces motions of pure irrotational shear in which the main axes of all the stresses and strains and time derivatives remain always parallel to one another. The tube formation by rolling of a cylinder has now been established as a phenomenon of great generality which may be regarded as counterpart to the well-known normal pressure phenomenon occurring in elastic and visco-elastic solids and liquids (such as the climbing up of a material on a rotating stirring rod).

Drs. H. Kolsky and F. C. Roesler (Imperial Chemical Industries, Ltd., Welwyn) showed how relaxation spectra may be derived from mechanical measurements on solids. In attempting to correlate the mechanical behaviour of materials with the microscopic processes which cause them, it is desirable to obtain what is termed a 'relaxation–time spectrum' of the material. This treatment postulates that the mechanical behaviour of the solid corresponds to the summation of an infinite number of relaxing elements each with its own time of relaxation, and the spectrum describes the relative strength of these elements. Thus peaks in the relaxation–time spectrum would correspond to the presence of a large number of mechanisms which have characteristic times of values around the peak, and in many cases, especially with metals, it has been possible to correlate these peaks with specific processes taking place in the material.

A number of methods have been developed for the determination of relaxation–time spectra from experimental data and for the conversion of results of one type of measurement into another. The basis of this method is the Fourier analysis of the experimental curve on a logarithmic plot into its separate components. Each component is then multiplied by an appropriate eigen value, and a new curve is thus synthesized. These methods have been tried on a number of published experimental results, and have proved to be extremely effective in dealing with these problems. Recently a numerical iteration method, which avoids the necessity for an explicit Fourier analysis, has also been developed; and while this is not of such wide application as the other approach, in the cases where it may be used it is generally more convenient and may be shown to be equivalent to the more detailed method which employs Fourier analysis.

J. E. Caffyn and L. Goodfellow (Physics Department, Durham) described the mechanical and electrical properties of sodium chloride and made a survey of the effect of mechanical deformation on the electrical conductivity. Apparatus to enable transient electrical phenomena in sodium chloride to be investigated and its application to the study of the changes in electrical properties (particularly conductivity) of ionic crystals were described. Typical results were given for several of the alkali halides, and their variations among different crystals were discussed. A new electrical phenomenon associated with the plastic deformation of the alkali halides and its dependence on temperature was mentioned. Its significance for the earlier measurements was discussed.

Dr. R. Roscoe (Physics Department, Newcastle) spoke of the interpretation of mechanical relaxation in solids. It follows from Boltzmann's principle of superposition that the mechanical behaviour of any material which shows linear visco-elastic effects can be represented in terms of a spectrum of relaxation times or, alternatively, as a spectrum of retardation times. The question arises as to which of these two spectra can be more directly interpreted in terms of the molecular relaxation processes which are ultimately responsible for the visco-elastic effects. It is shown that, when these processes consist in the breaking of linkages in a solid structure, the spectrum of relaxation times for the molecular processes is identical with the retardation time spectrum, provided there is only weak interaction between the individual relaxation processes.

P. J. Kirby (James A. Jobling and Co., Ltd., Sunderland) described results of experiments on 'Pyrex' glass from which the relaxation spectrum over a range of temperature up to the annealing range can be derived. A migration of alkali ions in the vitreous network gives rise to another relaxation process—in electrical conductivity—and the half-maximum widths of the relaxation spectra are compared with those relating to the visco-elastic effects of the entire network. The distribution of relaxation periods suggests a distribution of the activation energies governing the process. A measure is thereby obtained of the associated distribution of potential barrier heights in the vitreous network. The migration of a network-modifying ion is subject to a wider range of irregularity of activation energy than the general visco-elastic deformation of the network-forming ions.

Drs. A. W. Pryor and E. G. Richardson (Physics Department, Newcastle) have carried out experiments using ferrite transducers of 50 and 100 kc./s. excited magnetostrictively to send torsional waves down long rods made of metal or glass. By varying the temperature in a container surrounding the rod, and measuring the attenuation and phase-shift of transmitted pulses, the elastic modulus and viscosity of the material of the rod or of a liquid under shear in the container were measured. The absorption is less in solutions of rubber in benzene than in pure solvent. The fact that the absorption in these highly viscous solutions is many times less than those calculated from the classical formula—by substituting the known shear viscosities—can be explained by assuming that the high viscosities are by-passed by associated elasticities (that is, these liquids behave at high frequencies more or less as solids).

## ADOPTION OF THE UNIFIED SCREW THREAD BY BRITISH INDUSTRY

REPRESENTATIVES of many branches of the engineering industries, the Service Departments and the nationalized industries met recently at the British Standards Institution, under the chairmanship of Mr. H. A. R. Binney, director of the Institution, to review how far the Unified Screw Thread has, in fact, been adopted in Great Britain. The conference was called in response to many inquiries as to how far and how fast the change-over from the Whitworth Thread has progressed during the seven years since the signing of the "Declaration of Accord" between the United States, Britain and Canada, under which the three countries agreed to accept the Unified Thread.

During the years immediately following the signing of the Accord, several British Standards were developed by the Institution for Unified bolts and nuts, screwing tackle and other details necessary for the implementation of the agreement. In the early stages manufacturers of bolts and nuts were unable to meet all the demands for Unified bolts and nuts; but recently the position has improved. The draft standard for black bolts and nuts in the 'normal' series will soon be issued, and manufacturers now foresee no serious difficulty in meeting any future demands likely to be made upon them. The motor, aircraft, oil and chemical industries and the Atomic Energy Authority have all adopted the Unified Screw Thread, and have found that the change-over has not been nearly as inconvenient as they had thought it would be. One of the major difficulties to be faced is not so much the change from Whitworth to Unified bolts and nuts; but the fact that tapped holes are employed in such a great variety of engineering equipment and that this equipment is produced in a wide range of separate industries which includes many comparatively small firms. The opinion at the conference was that the three key groups which can do most to further progress of the change-over are large organizations, such as the nationalized industries, with their ability to influence the market by the many large orders for equipment which they place; the stockist, who is responsible for supplying small orders to a great number of small firms; and the many small manufacturers, who produce miscellaneous industrial equipment with tapped holes.

Although the rate of the change-over to the new thread has been considerably faster than might have been expected some four or five years ago, the advantages to be achieved by working to a single screw-thread system, particularly one which there is every reason to believe will receive increasing support in the Commonwealth and other overseas markets, are so great as to make it very desirable that the tempo of the change-over should be increased. The British Standards Institution was asked to take such steps as may be appropriate to secure wider publicity for this objective, and it was decided that the conference should meet again in about six months time to review the progress then made.

## SUBJECT SPECIALIZATION AND CO-OPERATIVE BOOK PURCHASE IN BRITISH LIBRARIES

IN Library Association Pamphlet No. 12 (pp. 32; 1955), Mr. K. G. Hunt, chief librarian of Hammersmith Public Libraries, contributes a useful survey of schemes in subject specialization and co-operative book purchase by libraries in Great Britain, concluding with a quotation from the second interim report (January 1954) of the Working Party of the Library Association. Mr. Hunt gives first some examples of comprehensive schemes arranged by the universities and special libraries. In London, for example, while each of the specialist hospitals covers its own subject, the University Library is building up a large collection of medical periodicals. At Oxford the book selection committee of the Science Library, on which the departmental libraries are represented, avoids a duplication of expensive specialized scientific works. Most of the examples given by Mr. Hunt are outside the field of science, but for medicine the London School of Hygiene, the Medical Research Council, the Royal College of Physicians, the Royal College of Surgeons, the Royal College of Veterinary Surgeons, the Pharmaceutical Society and the Medical Science Library of University College formed a co-operative group, to which the British Medical Association also is attached; this group attempts to arrange that each library keeps to certain fields and informs the others of changes of holdings of periodicals.

A fairly full account of the Metropolitan Special Libraries scheme, inaugurated in 1948 by London Metropolitan public libraries, follows next in the pamphlet. This scheme enabled its constituent libraries to give a service far in excess of what was previously available and has also contributed towards a solution of the storage problem. Later, in January 1950, the South-Eastern Regional Library Bureau's scheme came into existence, under which an attempt was made to ensure that all newly published books were bought somewhere in the area. Afterwards, responsibilities under the scheme were assigned according to the resources of each library, and each library was also asked to become responsible for the biographies of persons connected with their special subjects. Later still, schemes were started among the public libraries of the Northern Region, the East Midlands (limited to books in foreign languages), Wales (for certain specialized books), and in April 1954, in the North-Western Region (in which seventy-five libraries participated, but periodicals and purchase of older books are excluded).

Mr. Hunt suggests that the most necessary future developments are likely to be concerned with increasing the provision of foreign books, and co-ordinating and improving the supply of periodicals. Such problems are mainly the concern of university and special libraries; but the various regional schemes of public library co-operation could easily be co-ordinated and improved by dividing the responsibilities for still higher degrees of specialization between the specializing libraries in each subject in each region on a systematic and orderly basis. This would give strong support to any co-ordination attempted by research institutions acting alone.

# AMERICAN PHILOSOPHICAL SOCIETY

## YEAR BOOK FOR 1954

THE Year Book for 1954 of the American Philosophical Society* includes E. G. Conklin's brief history of the Society, its charter and laws, reports of standing committees, and the usual lists of members and biographical memoirs, among which may be noted those of M. T. Bogert, Sir Henry Clay, K. T. Compton, H. E. Ives, T. Lyman, R. A. Millikan and H. A. Spoehr. The report of the Committee on Research lists 165 grants, totalling 144,770 dollars, and one conditional grant of 600 dollars, made during the year from the Penrose Fund. Six of these, totalling 8,300 dollars, were in astronomy, physics and chemistry; thirty-six, totalling 29,195 dollars, in zoology, botany, anthropology, biochemistry, physiology, psychology and related sciences; forty, totalling 37,755 dollars, in history, political science, economics and sociology; and eighty-three, totalling 72,520 dollars, in ancient, medieval and literary history, archæology, philology, art, literature, etc. Eight grants, totalling 21,336 dollars, were made from the Johnson Fund and six grants, totalling 13,335 dollars, from the Daland Fund for Research in Physical Medicine.

Reports from recipients of grants occupy some two hundred and fifty pages of the report of the Committee on Research. Among the more detailed of these summaries may be noted those of H. B. Levi on recent progress in the field of radiocarbon dating; M. K. Hecht on the comparison of recent and fossil amphibian, reptilian and mammalian faunas in the Bahamas; A. Carr's survey of the zoogeography and migrations of sea turtles, which indicates that under present conditions the green turtle is likely to be extirpated from the Caribbean within twenty years although it appears to be peculiarly amenable to conservation; K. T. Guthe's study of the myosin adenosine triphosphate of the echinoderm *Stichopus*; and C. J. Heusser's studies of glacier fluctuation, forest succession and climatic variation in the Canadian Rockies and pollen profiles from the Queen Charlotte Islands, northern Vancouver Island and northern coastal British Columbia. R. Singer reports on studies of the Basidiomycetes of South America in European herbaria, and J. L. Angel on the evidence as to human biology, health and history in Greece obtained by careful study of human bones excavated in Greece; M. J. Herskovits reports on field work in sub-Saharan Africa to assess how pre-existing cultural patterns react to different rates of industrialization and technological innovation, within the limits of differing Colonial policies, while W. B. Schwab discusses the analysis of material collected in a socio-economic survey of the Yeruba community in Nigeria with the object of examining the interrelations of urbanization and acculturation.

D. R. Brown summarizes an investigation of the effects on cortical currents of organic damage to the brain by the use of a behavioural measure involving the kinesthetic figural after-effect which appears to support the assumption that the lesion introduced in a lobotomy sets up a temporary physiological disturbance in the cortex which will change the conductivity of the higher brain centres and therefore the kinesthetic after-effect. W. S. Verplanck describes an interchange of experimental techniques and theoretical structures between European ethologists and American psychologists; and L. S. Ciereszko gives an account of the determination of vanadium in tunicates and of acidity in *Ascida nigra* as well as the collection, identification and preparation of various tunicates, sponges and gorgonians. N. C. Li reports on metal complexes of peptides containing sulphur, H. W. Neuberg on the metabolism of phosphophenolpyruvate, F. W. Crane on the spores of *Dryopteris*, and G. T. Johnson on the Mississippi species of the Trypetheliaceae.

In the social sciences, D. W. Meinig describes and analyses the nature of man's contact with the major agricultural frontier of the Pacific north-west and the Columbia Plateau grain region from 1805 to about 1910, and C. T. Mason an inquiry into the non-profit research institute and how it functions. In archæology, H. A. Carey reports on a study of the ancient Indian culture centring in the Casas Grandes Valley, north-west Chihuahua, Mexico; F. E. Day on early Islamic pottery related to that of Tarsus and 'Arija Hafir'; K. P. Kent on the textile industry of prehistoric south-western Pueblo peoples, particularly with regard to weaving in cotton; R. S. MacNeish on the development of agriculture and the concomitant development of civilization in Meso-America, Tamaulipas, Mexico; H. C. Palmatary on Brazilian, Swedish and American Tapago pottery; and A. N. Stilwell on pottery from the Potters' Quarter in Corinth. P. Drucker describes a study of intertribal organizations of the north-west coast of the United States, I. Greenwald a study of the history of goitre, and C. Eisele one of C. S. Peirce and the history of science. Investigations of the freshwater ostracods of South Carolina are described by E. Ferguson, taxonomic and ecologic researches on the ants of Nevada by A. G. Cole, and a detailed field study of spring Orthoptera in western and south-western States by J. A. G. Rehn.

# FINE STRUCTURE OF CELLULOSE AND OTHER MICROFIBRILLAR SUBSTANCES

By V. BALASHOV and

Prof. R. D. PRESTON, F.R.S.

Botany Department, University of Leeds

THE sub-microscopic structure of matter has long been investigated by deducing it from the manner in which it scatters either electromagnetic or particle rays. A method of stating this relation in a most elegant form is offered by the Fourier transform which is sufficiently general to include scattering of electrons as well as of X-rays. X-ray crystal structure analysis, however, cannot be employed when we have wave-lengths much shorter than 0·5 A., since incoherent scattering, which is not governed by the Fourier transform, becomes dominant. For these shorter wave-lengths recourse has to be made to electron diffraction. Electron diffraction diagrams of *Valonia* cellulose have already been published from this laboratory[1], and it is the purpose of this article to examine some of the features of these diagrams which were not discussed at that time.

Hettich[2] pointed out that the transform of any group of atoms will describe the contribution of that group to the total scattering from any crystal in which it may occur. Transforms of molecules which consist mainly of parallel hexagons have one feature in common: they all tend to have hexagonal symmetry[3]. Since for a periodic structure, that is, a crystal, the transform reduces to its own weighted reciprocal lattice, the latter often exhibits symmetry of the transform which can be observed on the diffraction photograph. Electron diffraction diagrams of *Valonia* cellulose show a fairly well-developed hexagonal shape of the pattern (Fig. 1). The orientation of this hexagonal distribution of reflexions with respect to the direction of the microfibrils (Fig. 2) indicates that the glucose residues are arranged in such a way that two sides of the glucose residue rings are oriented approximately parallel to the fibre axis. This confirms, therefore, the orientation assumed in the commonly accepted structure of native cellulose[4,5].

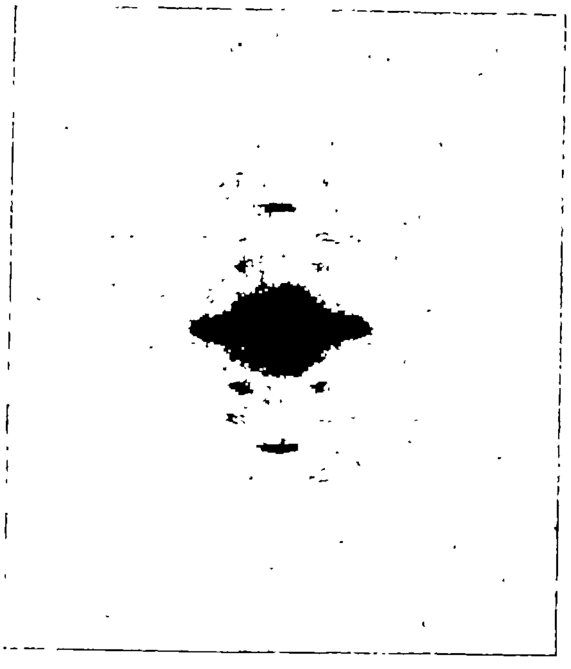

Fig. 1. Electron diffraction diagram of a single set of microfibrils of *Valonia* cellulose. Note the hexagonal shape of the pattern and the low intensity of the first and seventh layer lines

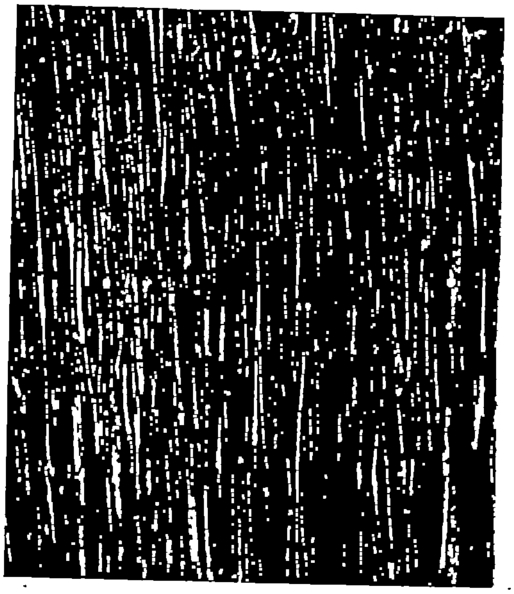

Fig. 2. Electronmicrograph of *Valonia* cellulose microfibrils in correct orientation with respect to Fig. 1 (× 30,000; shadowed Pd—Au)

The same electron diffraction photographs show also very prominently the effect of thermal motion of the cellulose chains. Since the wave-lengths used in these observations are about twenty times shorter than that of copper $K\alpha$ radiation, the intensities of diffracted rays are much more sensitive to molecular and atomic movement. The thermal vibration of the atoms is mainly shown in the direction perpendicular to the length of the chain, longitudinal waves in the direction of the chain-length being negligible. Thus the reflexion from the planes which are parallel to the chain-length fades away at much smaller Bragg angles than do the reflexions due to planes normal, or nearly normal, to chain-lengths.

At present, using the Philips electron microscope, it is possible to record nine layer lines above and below the equator. It is important to note that the distribution of intensities among the layer lines is such that, apart from very low intensity planes of the type $\{h1l\}$, there is another similar group of planes $\{h7l\}$. This phenomenon, being closely connected with the atomic architecture of the unit cell of cellulose, is a valuable guide in the refinement of the structure of native cellulose.

In contrast with the X-ray method, the amount of scattering material used in electron diffraction is enormously decreased, and thus the chance of having all scattering crystalline regions oriented in very nearly the same way is much higher. As a consequence the reflexions appear as fairly sharp spots. In fact, the electron diffraction pattern of native cellulose has more resemblance to a single crystal oscillation-rotation picture than to a fibre photograph.

The atomic scattering power in the diffraction of electrons is about $10^{8}$ times higher than for X-rays. Hence, although the collimating system has very

narrow openings and the distances between specimen and film in the electron microscope are of the order of tens of centimetres, the exposure time is usually a fraction of a second. On the other hand, the electron beam, being so strongly scattered, can pass through very thin layers only. From the formation of the spot pattern on the electron diffraction photograph of cellulose it follows that the thickness of the crystallites in the single layer of the cell wall of the alga *Valonia* is about 100–500 A.[6].

These numerical values lead to rather important conclusions. In the course of an investigation of the structure of the cell wall of *Valonia* it was shown[7] that microfibrils forming the cell wall are of width 200 A. More accurate data[8] obtained in 1951 revealed that the microfibrils vary in width from about 100 A. to about 350 A. and are flattish ribbons with the thickness to width ratio lying somewhere between 1/3 and 1/7. Comparison of the thickness of the crystallites derived from the electron diffraction pattern (from the single layer of *Valonia* cell wall) with the width of the microfibrils indicates strongly that the latter are in fact almost pure crystalline rods. It seems probable that the same considerations could be applied to all those algae in which the wall architecture resembles that of *Valonia*[9]. As has already been pointed out[9], it may not be concluded that the microfibrils of all celluloses are single crystals; on the contrary, it is clear that in bacterial cellulose and the celluloses of higher plants the internal structure may be of the general type figured by Frey-Wyssling[10], that is, with a lower degree of crystallinity.

Investigation along these lines concerning the fine structure of the crystalline state of native cellulose is continuing. The observation, however, that the microfibrils of cellulose are of the same order of diameter irrespective of their internal structure leads irresistibly to the speculation that there might be something special about dimensions centring roughly around 200 A. It is interesting, therefore, to note the order of size of various fibriform bodies (visible in the electron microscope), and we present in Tables 1 and 2 some of the data we have found in the literature. This is to direct attention to the remarkable similarity in size between the finest units visible in a number of substances of very different chemical constitution. We do not at the moment wish to comment further, nor indeed are we perhaps capable of usefully doing so; but it would seem reasonable to suggest that there may be some principle of structure conferring special stability in fibres or sheets about 200 A. thick. The microfibril of cellulose might then be not a biological unit, as we had thought, but a thermodynamic one. [May 4

# SYMMETRY OF THE SECOND EXCITED SINGLET STATE OF BENZENE

By T. M. DUNN and PROF. C. K. INGOLD, F.R.S.

University College, London

ALL π-electron theories have agreed in assigning the first singlet excited state of benzene, that responsible for the band-system at 2600 A., to the trigonally symmetrical species $B_{2u}$; and this assignment has since been fully established by experiment[1]. However, agreement between the different theories does not extend to the second excited singlet state—

that involved in the band system at 2000 A. Moreover, the nature of this state has not yet been made clear on experimental grounds, though the importance of the question, as the simplest crucial test of π-electron theories, is widely recognized.

This second state was originally assigned to the other trigonal species $B_{1u}$, in 1938, by Goeppert-Mayer and Sklar[2], on the basis of a calculation of benzene energy-levels by the method of molecular orbitals. In 1950 Craig extended this method outside its basic framework of the direct description of each molecular state in terms of a specified configuration of electrons in molecular orbitals, by computing the effect of configuration interaction, that is, resonance between the various possible distributions of electrons among orbitals[3]. On this broadened basis, Craig found the second excited level of benzene to belong to the degenerate class $E_{2g}$, the trigonal $B_{1u}$ level lying considerably higher. Also in 1950 he showed that the valency bond method, when extended within its own framework by the inclusion of polar structures[4], as is particularly necessary for the discussion of excited states, which are for the most part strongly polar, also gave the second excited state as an $E_{2g}$ state, the $B_{1u}$ state again lying considerably higher. The valency-bond method, though it employs bond orbitals rather than molecular orbitals, is essentially a resonance, or many-configuration, method; and so it appears to be the typical result of resonance among many electronic distributions that the degenerate $E_{2g}$ level of benzene lies lower than the trigonal $B_{1u}$ level. Since 1950, a number of authors[5] have continued to support the first assignment on the ground that, although Goeppert-Mayer and Sklar's form of the molecular orbital theory was not wholly satisfactory, other forms of it, particularly semi-empirical modifications, would have less need for account to be taken of configuration interaction, and so would continue to give the typical single-configuration result that the $B_{1u}$ state lies lower than the $E_{2g}$ state.

Here, then, is a clear issue; but in treating it, one must keep in mind such other alternatives as cannot already be shown to be impossible, even if they might appear improbable. One such possibility has been suggested[6]; and it is that the second singlet band-system of benzene constitutes the first member, with $n = 3$, of the allowed Rydberg series of states $2p\pi \rightarrow ns$. This implies an upper $A_{2u}$ state; and the diagnostic feature of the proposal is that such a transition must be polarized perpendicularly to the aromatic plane. However, Craig and Lyons made it very probable, by reference to the corresponding band-system of hexamethylbenzene, which they studied with polarized light in the layer-plane crystal of that substance[7], that the main intensity of the system is polarized in the aromatic plane. All pure π-type non-ionizing transitions must be polarized in the aromatic plane. This evidence is strong, but not perfectly conclusive, because the magnitude of the spectral disturbance, due to crystal forces, can only be roughly estimated; but we do not believe that it could be large enough qualitatively to invert the conclusion drawn. A subsidiary argument is that such Rydberg bands would be expected to be sharp. The bands of the system at 2000 A. are far from sharp. However, certain π-type transitions contain in their own nature a cause of band diffuseness, apart from any diffuseness that might be imposed on them by external perturbation.

We shall keep in mind also some just conceivabl interpretations of the second band-system whic have not been suggested before. One is that it ma be a π-type transition to a forbidden, partly pola $E_{1u}$ state, calculated by the valency-bond metho to lie next above $E_{2g}$ (and not to be confused wit the allowed, fully polar $E_{1u}$ state, which lies highe still). Another assumes that some current assignments of higher Rydberg terms, which are not full proved, are incorrect, thus allowing our state to b a forbidden *s*-type Rydberg state of symmetry $E_{1g}$. But the convenient procedure is to keep all suc ideas in reserve, for a subsequent consideration of an modifying effect they may have on the conclusion t be drawn from an attempt first to treat the questio of assignment as a straight issue between the contrar indications of single-configuration and resonanc theories. So we first set down the expected spectra characteristics of transitions to the states $B_{1u}$ an $E_{2g}$.

Transitions from the ground-state to a $B_{1u}$ stat are forbidden, but can occur, along with a one quantum change in that $e_{2g}$ vibration which involve radial motion of the CH groups (frequency 605 cm.$^{-}$ in the ground-state)[8]. There should be a main progression towards short waves in successive quanta o the upper-state ring-breathing vibration $a_{1g}$ (frequency 990 cm.$^{-1}$ in the ground-state). There shoul also be a similar, but temperature-sensitive, Boltzmann progression, shifted by about 1,100 cm.$^{-1}$ to lon waves, and about fifteen times weaker than the mai progression at room temperature. The bands shoul be sharp, apart from any effect of external perturbations. In short, a $B_{1u}$ band-system at 2000 A. should closely resemble the familiar $B_{2u}$ band system at 2600 A., for which, indeed, a $B_{1u}$ assignment wa at one time suggested[9]. An addition to this descriptio is made later.

Transitions from the ground-state to an $E_{2g}$ stat are forbidden, but can occur in association with a one-quantum change in a $\beta_{1u}$, $\beta_{2u}$ or $\epsilon_{1u}$ vibration most strongly with such a change in the $\beta_{1u}$ vibration of CH groups (frequency 1,010 cm.$^{-1}$ in the ground-state)[8]. The total consequences are somewhat complicated, and so we describe them in successive approximations. The first approximation is that there should be a main progression towards short waves in the ring-breathing vibration of the uppe state, but that the corresponding Boltzmann progression would be difficult to observe, as it would be more than a hundred times weaker, and displaced to long wave-lengths by about 1,900 cm.$^{-1}$, thus originating in the observable tail of the $B_{2u}$ band-system.

Our second approximation starts from Jahn and Teller's proof[10] that every non-linear molecule which is sufficiently symmetrical to permit degenerate internal motion will have a normal co-ordinate with the property that, in a degenerate electronic state, the energy will be minimized at a non-zero value of the co-ordinate, with the result that the original equilibrium symmetry will be lost, and the degeneracy of the electronic motion will be split. It is easily shown that, in benzene, the active normal co-ordinate is one of those belonging to the already mentioned $e_{2g}$ vibration; in particular, that one which flattens the hexagon vertically or horizontally by pulling apart or pushing together two opposite sides, thus reducing the symmetry from $D_{6h}$ to $V_h$. It is to be concluded[11] that the nominal $E_{2g}$ state will actually consist of the two, energetically separate, but close-

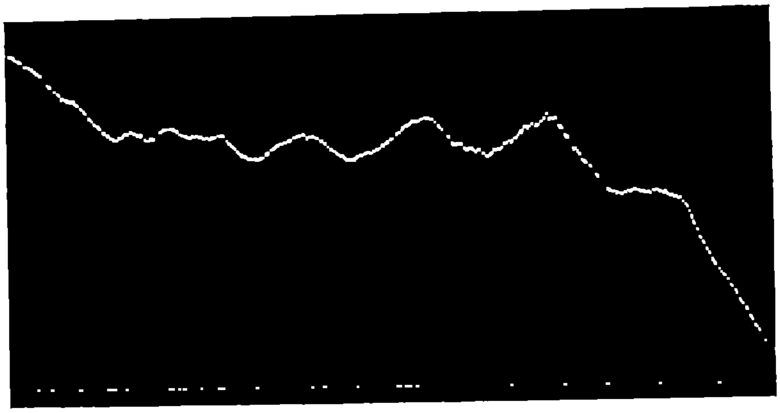

Fig. 1. The 2000 A. band-system of benzene vapour

ving states, $A_g$ and $B_{1g}$, approriate to the lower symmetry; and that each of these will have, s its equilibrium nuclear conguration, a different flattened hexagon of symmetry $V_h$, the two flattened hexagons being interconvertible by the $e_{2g}$ vibration. This has two immediate spectral consequences. First, because of the larger number of vibrations that are now totally symmetrical with espect to the reduced nuclear symmetry, our simple progression will become a compound one, involving combinations of different vibrations, especially the ring-breathing vibration (corresponding to $a_{1g}$ of frequency 990 cm.$^{-1}$ in the ground-state), which allows ring-size to change on excitation, and the ring-flattening vibration (corresponding to $e_{2g}$ of frequency 605 cm.$^{-1}$ in the ground-state), which, by converting the original regular hexagon into either flattened hexagon, allows ring-shape to change on excitation. Secondly, the whole of this compound progression should be doubled, with a separation of the order of magnitude of a vibration frequency[11], because of the doubled electronic origin.

A third approximation is necessary in this description, for the reason that the relatively small magnitude of the Jahn–Teller electronic splitting will cause a breakdown of the Born–Oppenheimer approximation, which normally allows each electronic state to have its own vibrations. This has two further spectral consequences. The first is derived from the circumstance that any vibration that could interconvert the flattened hexagons will belong in principle to both states, and will act as a vibration controlled by a potential with two unequal minima separated by a low barrier. We therefore expect our compound progression of doubled bands to break up at various points, depending on the interconverting vibrations concerned, into a series of single bands about twice as closely spaced. A very few quanta of the ring-flattening vibration, which is best suited to effect the change of shape, could bring about such a break-up; but more quanta of the ring-breathing vibration would be needed, inasmuch as change of shape on its account depends on the differences of amplitude of the radially moving carbon atoms. The second spectral consequence follows from the consideration that vibration will become coupled, not only with electronic motion, but also with rotation, because conserved angular momentum, quantized totally, and about the axis of a symmetrical top, but not about the axes of asymmetrical tops, and carried by degenerate vibrations in a symmetrical top, and by electronic motion and rotation in this, and in our interacting asymmetrical tops, will be shifted about between these carriers during excitation to the double state described. We can see here plenty of cause for expecting all bands to have a smooth appearance.

A final point can now be added to our theoretical description of a $B_{1u}$ band-system. The intensity of the system at 2000 A. is obviously stolen from the shorter-wave allowed system, involving the upper state $E_{1u}$. This is degenerate, and must suffer Jahn–Teller splitting. It follows that a $B_{1u}$ system at 2000 A. should, in its main progression, but *not* in its Boltzmann progression, exhibit a pale reflexion of the consequences of this degeneracy, by showing a narrow splitting, and a little smoothing of the bands. These effects should be small compared to those arising from an upper state, such as $E_{2g}$, to which degeneracy is indigenous.

Experimental study of the band-system at 2000 A. is, indeed, made difficult by the smoothness of the bands, and the consequent impossibility of securing frequency differences of the accuracy desirable for vibrational analysis. However, our study of the system includes an attempted analysis. We conclude that no analysis is possible on the basis of a $B_{1u}$ upper state, but that a plausible analysis can be given on the assumption of an $E_{2g}$ upper state.

The band-system has been described several times before[12]; but we reproduce a general microphotometer record of it as a reminder of its overall form (Fig. 1). We see a widely spaced progression of strong bands, breaking up at the fourth quantum into a series of closer, moderately strong bands, and carrying, from the first onset of strong absorption, a superposed ripple of closely spaced weaker bonds, which at higher energies die away. All bands are smooth, and, so far as can be seen, are shaded in both directions. None of the bands mentioned appears to be weakened by cooling. Little can be seen of any Boltzmann progression in the long-wave region. This remains true on heating.

So different is this appearance from that of the familiar $B_{2u}$ system, at 2600 A., that we think it unnecessary to elaborate the thesis that any attempted analysis of the present system on the basis of a $B_{1u}$ assignment is bound to fail. In particular, there are no Boltzmann bands remotely approaching the strength of those required for a $B_{1u}$ assignment in, or anywhere near, the expected region.

Although we have not the confirmation which might follow could we measure accurate frequency differences, the general lines of an analysis based on an $E_{2g}$ assignment can be given. The two vibronic origins demanded by Jahn–Teller splitting are identified with the first two bands at the onset of strong absorption, the first at 49,065 cm.$^{-1}$ and the second at 49,215 cm.$^{-1}$; the splitting thus amounts to 150 cm.$^{-1}$. The frequency of the first quantum of the ring-flattening vibration is taken as about 320 cm.$^{-1}$ in either state; and we account for the smallness of this value, compared to the corresponding ground-state frequency, 605 cm.$^{-1}$, by supposing that, although the zero-point levels in the split states are separate, even one quantum of this vibration will mix the electronic states. This vibration is totally symmetrical with respect to the deformed hexagons, and therefore is allowed to appear with successive quantum numbers. Consistently, we find it appearing with one, and then with a second quantum in each split state, or, putting it more correctly, with four successive quanta in the interacting pair of states. Then a quantum of the breathing frequency, taken to be about 900 cm.$^{-1}$ in either state, supervenes, leading to a strong maximum, doubled because of the two vibronic origins. After that, the pattern of weak bands repeats itself, gradually fading out over the next two strong bands, which represent the addition of a second and a third quantum of the breathing vibration. About here, the breathing frequency begins to show very strong anharmonicity; and immediately thereafter the breathing progression breaks up into more closely spaced, but apparently simpler, bands, which can be followed into the bank of intensity leading to the next band-system. We explain the sudden incursion of strong anharmonicity, and the immediately following break-up of the progression, by assuming that four quanta of the breathing vibration suffice to cause full mixing of the split electronic states.

In the long-wave region, only one Boltzmann band of more than very small strength has been observed; but it is very difficult to measure, being so overlapped in the first onset of strong absorption. Our measurements place it 275 cm.$^{-1}$ below the first maximum at 49,065 cm.$^{-1}$; but, because of the overlap, this estimate could be wrong by 50 cm.$^{-1}$. The only Boltzmann band which might be predicted from the $E_{2g}$ electronic assignment, to have sufficient strength and separation from main bands for fairly easy observation, would occur in this region. It is the 1 → 1 transition of the ring-flattening vibration; for, although 1 → 1 transitions in all vibrations are allowed by symmetry, no vibration other than this could have, at once, so large a Boltzmann factor, so large a frequency difference between upper and lower states, and a transition probability so favoured on Franck–Condon grounds. Because of the two vibronic origins, this 1 → 1 transition should produce two bands, situated, according to the figures already given, 140 and 285 cm.$^{-1}$ below the maximum at 49,065 cm.$^{-1}$. The first of these would be completely buried in the strong band; but the second could be the much overlapped band we have measured, 275 cm.$^{-1}$ below the first maximum.

The only other Boltzmann bands the presence and approximate location of which seem certain are two (at least) extremely weak bands near 850 and 1,000 cm.$^{-1}$ below 49,065 cm.$^{-1}$. They are not overlapped; but their extreme weakness makes measurement difficult. Two interpretations are possible, one depending on, and the other independent of, the electronic assignment. The strongest (though still very weak) Boltzmann progression that should be characteristic of an $E_{2g}$ electronic state is that which involves one quantum of the ground-state frequency 1,010 cm.$^{-1}$ throughout, and, in the upper state, a succession of quantum-levels of the breathing vibration. Each member of this progression should consist of a pair of bands 150 cm.$^{-1}$ apart; but the first member of the progression would be mixed with the tail of the long-wave $B_{2u}$ band-system; and the third and higher members would be under the strong bands of the band-system now under discussion. The one member that we might hope to find is the second, for the two reasons that it alone would not be overlapped and that it would be the strongest member of its progression, just as the second member is th strongest in the main ring-breathing progressio This second Boltzmann member would be represente by a pair of bands in about the positions in whic ours are observed. However, any electronic assign ment would permit a very weak Boltzmann pro gression involving one quantum of the ground-stat frequency 990 cm.$^{-1}$, and a succession of quanta c the upper-state breathing vibration. The second an higher members of this progression would be burie under strong bands; but the first member would no be overlapped, and would consist of a pair of band approximately where ours are observed. These tw bands are too weak and diffuse to belong to th main Boltzmann progression of a $B_{1u}$ system, which should consist of single, sharp and fairly stron bands.

Turning to the electronic assignments held i reserve, an interpretation of the system as one of th forbidden π-state $E_{1u}$, or of the forbidden Rydber s-state $E_{1g}$, must fail, for one of the reasons for whicl the $B_{1u}$ assignment fails, namely, all these assign ments require easily observable Boltzmann bands, where none can be found. Interpretation as a system of the allowed Rydberg s-state $A_{2u}$ fails among the main bands: it cannot account for the doubling, the ripple and the break-up; and it disagrees with Craig and Lyons's probable identification of the direction of polarization. Thus we are unable to suggest any type of upper state, other than $E_{2g}$, on the single basis of which all the chief features of the spectrum can be understood. Of course, this does not mean that some other electronic state, perhaps one of the others considered, may not be responsible for a minor part of the intensity or even for some of the spectral appearance near the high-energy limit, where our system merges with the next strong system.

It is our provisional conclusion, therefore, that the second excited singlet π-state of benzene has the symmetry $E_{2g}$, in agreement with configuration interaction and valency bond theory, but contrary to single-configuration molecular orbital theory, in all its proposed forms. Further details of this work, and an account of some supporting investigations on hexadeuterobenzene, and on some halogen substituted benzenes, will be given elsewhere.

This investigation has benefited much from theoretical suggestions by Prof. D. P. Craig, and from exploratory work by Dr. L. E. Lyons. One of us (T. M. D.) wishes to acknowledge the receipt of a Science Scholarship from the Royal Commission for the Exhibition of 1851.

## Isolation and Properties of a Collagen soluble in Salt Solution at Neutral pH

The presence of a soluble type of collagen in skin, extractable with slightly alkaline phosphate buffers, has been reported by Highberger *et al.*[1]. On the basis of their studies of the metabolism of collagen in rabbit skin, Harkness *et al.*[2] have concluded that this protein is almost certainly a direct precursor of mature collagen and have called it 'alkali-soluble collagen'. The isolation procedure of Highberger *et al.* involved purification by solution in citrate buffer of pH 3·8 and dialysis against distilled water; *but the final product was no longer soluble in either neutral or alkaline buffers used for the original extraction.* It thus seemed likely that the physical properties of alkali-soluble collagen had been altered during isolation. We report here a new method of isolation and preliminary studies of some of the physical properties of the isolated protein.

The material was extracted from the skins of young rabbits with *M*/15 phosphate of *p*H 7 and precipitated by addition of sodium chloride to a final concentration of 16 per cent. Purification was carried out by repeated solution in phosphate and precipitation with sodium chloride or ammonium sulphate. The isolated material had a hydroxyproline content of 8·2 per cent (expressed as amino-acid nitrogen per cent total nitrogen) and very low tyrosine content. It had a low solubility, approximately 0·2 per cent, in *M*/15 phosphate of *p*H 7.

Ultracentrifuge studies were made at 26° and 7° C., viscosity and birefringence measurements at 4° C., on solutions containing 0·02–0·09 gm. per cent in *M*/15 phosphate of *p*H 7·4. The schlieren diagram given in the ultracentrifuge showed a single sharp peak, without any evidence of gross heterogeneity. The sedimentation coefficient $S_{20}$, corrected to water at 20° C., varied considerably with the concentration $c$ (gm. protein per 100 ml. solution); $d(1/S_{20})/dc$ was constant at 1·68, and $S_{20}$ extrapolated to infinite dilution was 3·23 Svedberg units. The relative viscosity ($\eta_{rel.}$) measured in a Couette viscometer increased markedly as the velocity gradient was decreased below 5 sec.$^{-1}$. At zero velocity gradient, $(\eta_{rel.}-1)/c$ was 47 and did not change appreciably with concentration. Using Ogston's[3] method for a spheroidal particle, the following dimensions were derived: particle weight $\sim 10^6$, axial ratio 40, length 5,800 A. and an apparent hydration of 40 ml./gm. Birefringence measurements indicated a particle-length of about 4000 A., but showed that the material was not homogeneous. The ultracentrifuge schlieren diagram did not exclude inhomogeneity. The values are only approximate, but definitely indicate elongated particles. Electron micrographs made by Mr. R. Valentine of a solution of the material fixed on the grid by osmium tetroxide vapour and shadowed with platinum–palladium showed fine fibres of varying lengths. Material fixed in formalin, disintegrated by ultrasonic vibration and stained with phosphotungstate showed similar fibrils about 100 A. in diameter, and these were banded, with principal repeat units of about 2200 A. and 5000 A. (Fig. 1). This suggests that the material existed in solution as various linear aggregates of a unit of several thousand angstroms.

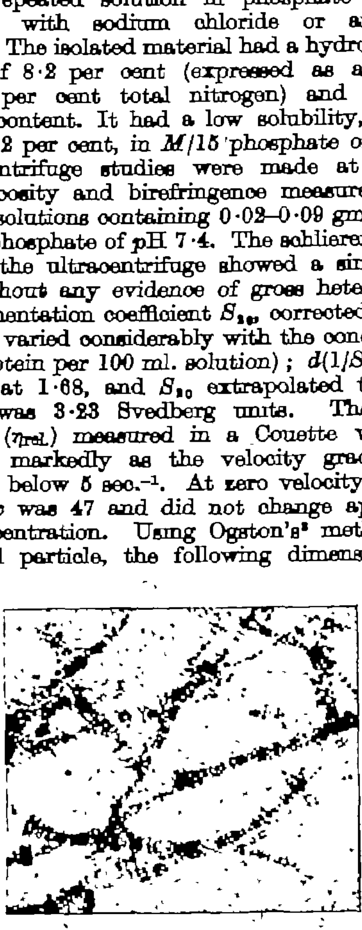

Fig. 1. Neutral salt-soluble collagen. Preparation as in text. × 50,000

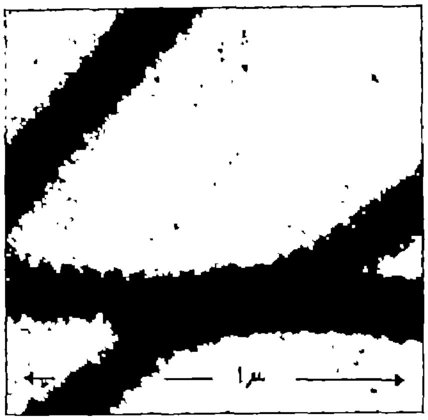

Fig. 2. Fibres formed at 5° C. from a solution containing 0·03 gm. per cent of neutral salt-soluble collagen, pH 7·2. Phosphotungstate stained. × 50,000.

On keeping solutions in various buffers at temperatures between 4° and 37° C., up to 80 per cent of the material was precipitated. This precipitate has been provisionally called 'heat-precipitated collagen'. The time taken for a precipitate to appear varied from seconds to weeks according to conditions. Between *p*H 6·5 and 7·4, the reciprocal of this time varied directly as the hydrogen ion concentration and also varied with the concentration of starting material. The logarithm of the reciprocal precipitation-time was approximately proportional to the reciprocal of the absolute temperature.

When the precipitate formed slowly, it consisted of fine fibres directly observable in the optical microscope and readily stainable with van Gieson connective tissue stain. Electron micrographs of the heat-precipitate stained with phosphotungstate show banded fibres of up to 2000 A. diameter with a major repeat distance varying from 580 A. to 800 A. in different fibres (Fig. 2). Various patterns of sub-striations, one 'polarized' in the direction of the fibre, are seen.

The appearance was quite different from that of neutral salt-soluble collagen, in which lateral aggregation did not exceed 100 A.

Preliminary studies indicate that heat-precipitated collagen is similar to acid-soluble collagen in that it is soluble in dilute acetic acid and citrate buffers, and has a similar appearance under the electron microscope. The transformation of neutral salt-soluble collagen to heat-precipitated collagen may then be similar to the *in vivo* transformation of alkali-soluble collagen to acid-soluble collagen suggested by Harkness *et al.*[3]. This possibility and the nature of heat-precipitated collagen are being further investigated.

After observing the phenomenon of heat precipitation, we received through Dr. A. Neuberger a personal communication from Drs. Gross, Highberger and Schmitt of similar findings; this work has now been published[4]. We are grateful to Dr. A. Neuberger and Dr. A. G. Ogston for valuable advice and to Mr. R. Valentine for the electron micrographs.

## Sorption Chromatography of Polar Substances on Polyamides

Linear polyamides, in the form of fibres or fine powders, are able to absorb polar substances from solution[1], with the formation of hydrogen bonds. The sorption is restricted to the amorphous regions, where a solution process of the polar substance into the polymer takes place. The Flory–Huggins relation[2]:

$$\ln a_1 = \ln v_1 + (1 - 1/x)\, v_2 + \chi_1 v_2^2 \qquad (1)$$

has been found[1] to hold, when the volume fractions $v_1$ and $v_2$ of the polymer and the polar substance are corrected for the degree of crystallinity of the polymer.

The amount of a polar substance which can be absorbed at equilibrium by a unit weight of polymer (which is related to $v_1$ and $v_2$) therefore depends upon a number of factors. These are: (i) the chemical potential of the substance at a given concentration of solution (which is related to its activity $a_1$ in the polymer); (ii) its thermodynamic interactions with the polymer (which are expressed by the semi-empirical parameter $\chi_1$); and (iii) the degree of crystallinity of the polymer.

The sorption isotherms of very similar compounds have been found to show marked differences, and substances containing groups which are able to form strong hydrogen bonds with the amide groups of the polyamides are absorbed to a very large extent. These observations have turned our attention to the possibility of using polyamides as absorbents for chromatographic separation of polar substances. Experiments undertaken in this direction have so far given promising results.

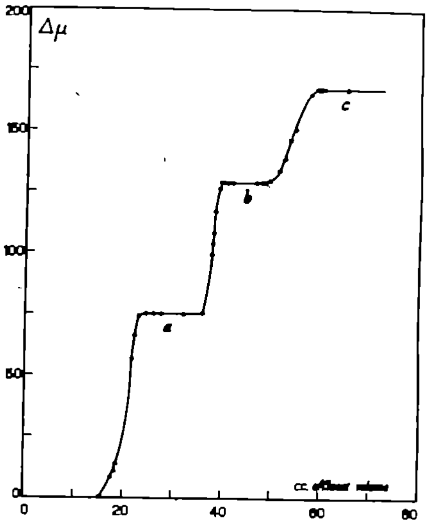

Fig. 1. Frontal chromatography of a mixture of three isomeric xylenols:

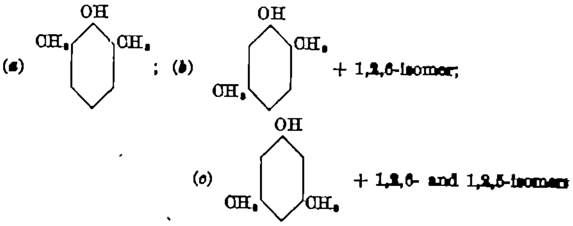

Two examples will be given here of absorption chromatography of compounds belonging to an isomeric group and to a homologous series. The first example deals with the frontal chromatography of a mixture of three xylenols, namely, the 1,3,5 (m.p. 68° C.; b.p. 219° C.), the 1,2,5 (m.p. 74° C.; b.p. 211° C.) and the 1,2,6 (m.p. 49° C.; b.p. 212° C.) isomers, all of which have very close physical constants. The second example deals with the frontal chromatography of a mixture of propionic acid, butyric acid and caproic acid.

The experiments were carried out in a Tiselius–Claesson apparatus of the *L.K.B.* type. A solution in *cyclo*hexane of the compounds to be separated was forced through a short column filled with a tightly packed powder of polyhexamethylene adip-

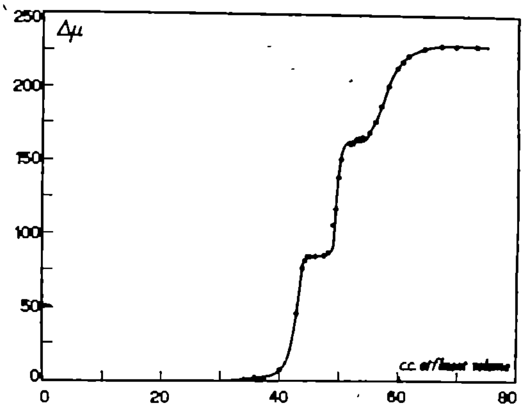

Fig. 2. Frontal chromatography of a mixture of propionic, butyric and caproic acids

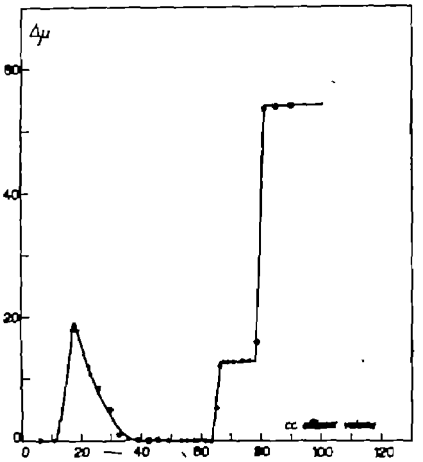

Fig. 3. Displacement chromatography of a mixture of 1,2,5- and 1,2,6-xylenols, using the 1,3,5-isomer as a displacer

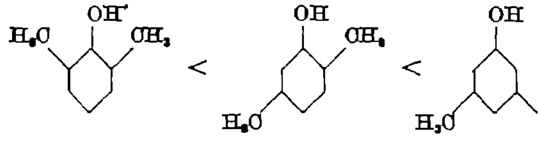
amide obtained by precipitating the polymer from a concentrated solution in formic acid by the addition of a water–alcohol mixture. The change in refractive index in the effluent liquid was determined interferometrically according to Claesson[3].

The chromatograms of Figs. 1 and 2 show that sharp fronts have been obtained.

When a solution of the 1,2,5- and 1,2,6-isomers was absorbed at the top of the column and a solution of the 1,3,5-isomer was then forced through the column, the first two isomers were displaced[4] by the third and a complete separation was achieved, as can be seen from Fig. 3.

In the first example, the extent of absorption follows the sequence :

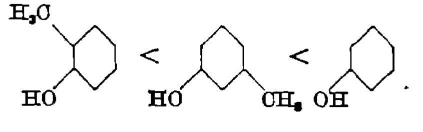


and in the second example :

caproic acid < butyric acid < propionic acid.

It must be emphasized that in the case of xylenols the extent of absorption increases with the separation between the methyl groups and the phenolic group.

The same rule has been found to hold for the absorption of *o*-cresol, *m*-cresol and phenol, where the sequence is :



Therefore, what might be called a 'screening effect' of the methyl groups on the OH group is likely to control the ability to form hydrogen bonds. It is interesting that the same effect seems to control the sequence in the partition coefficients of isomeric phenols between water and *cyclo*hexane[5].

This type of chromatography which has been described is an uncommon example of partition chromatography which might be termed 'sorption chromatography'. The method is very similar to liquid–liquid partition chromatography, the main difference being that one of the two solvents is the amorphous part of a polymer. The large capacity of the absorbent, which may take up to 50 per cent of its own weight of a polar substance, and the fact that it is able to support itself might make sorption chromatography very efficient for preparative purposes and for large-scale separations. Interesting results may be achieved in this way by applying less traditional chromatographic methods, taking advantage of the possibility of using the polymer both as fixed and mobile phase. The polymer could, for example, be used as a mobile phase in the form of long fibres, which, as pointed out by Martin[6], would be the most suitable form for an adsorbent to be used in a continuous separation.

Finally, an attractive feature of sorption chromatography lies in the possibility of choosing a suitable polymer for any given group of compounds to be separated. The sorption capacity of a given polymer could also be enhanced by suitable chemical modifications, or by block or graft copolymerization.

We are indebted to Dr. A. J. P. Martin for a valuable discussion and for reading the manuscript of this communication.

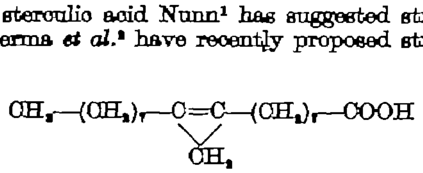
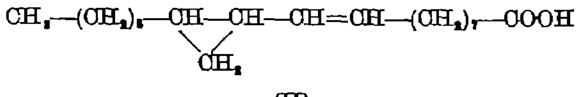
## Structure of Sterculic Acid and other Analogous Fatty Acids

For sterculic acid Nunn[1] has suggested structure (I) ; Verma *et al.*[2] have recently proposed structure (II).



$$\mathrm{CH_3{-}(CH_2)_7{-}\underset{CH_2}{C{=}C}{-}(CH_2)_7{-}COOH}$$

(I)



$$\mathrm{CH_3{-}(CH_2)_5{-}\underset{CH_2}{CH{-}CH}{-}CH{=}CH{-}(CH_2)_7{-}COOH}$$

(II)

In the course of an investigation into the composition of kapok seed oil, which is supposed to contain a fatty acid with a similar grouping, evidence has been found in support of structure (I) suggested by Nunn.

(1) Characteristic of the particular grouping in question is an infra-red absorption at 1,009 cm.$^{-1}$ (1,004 cm.$^{-1}$ by Verma); on careful hydrogenation a dihydro-derivative was obtained having an absorption of 1,021 cm.$^{-1}$ (1,015 cm.$^{-1}$ by Nunn). This characteristic frequency near 1,020 cm.$^{-1}$ of the *cyclo*propane ring is an 'in-plane wagging vibration' of the CH$_2$-group[3]. On conjugation with a C=O bond a slight displacement is to be expected, which actually occurs towards higher frequencies; Slabey[4] has found the following values: 2-*cyclo*propylpropane 1,018 cm.$^{-1}$; 2-*cyclo*propylpropene 1,023 cm.$^{-1}$.

However, the difference between 1,021 cm.$^{-1}$ and the 1,009 cm.$^{-1}$ occurring on the transition of dihydrosterculic acid to sterculic acid is considerably greater, and means a displacement in another direction. This may be due to the increased ring strain which is to be expected in a *cyclo*propene ring, and which has been established by means of electron diffraction measurements[5].

That this frequency is actually lowered by ring strain is also borne out by its displacement in the following series: *Cyclo*hexane 1,028 cm.$^{-1}$, *cyclo*pentane 1,028 cm.$^{-1}$, *cyclo*propane 1,023 cm.$^{-1}$, *cyclo*propene (?) 1,009 cm.$^{-1}$.

(2) *Sterculia fœtida* oil[6], kapok seed oil[7], and cotton seed oil[7] give the Halphen reaction (reddening with a solution of sulphur in carbon disulphide). With the first two oils the reaction is attended with the occurrence of a band at 1,009 cm.$^{-1}$; with cotton seed oil this band could not be detected, but this is probably caused by the sensitivity of the reaction and the extremely small amount of a similar fatty acid in cotton seed oil.

Whenever treatment of the oils caused the band to disappear, the Halphen reaction became negative, so that this reaction is apparently characteristic for the grouping in question.

As *cyclo*propane derivatives or conjugated systems do not give the Halphen reaction, it seems characteristic of the *cyclo*propene grouping rather than of structure II.

(3) The *cyclo*propane group is less reactive than the ethylene bond. A smaller activity is also to be expected from this system in conjugation with a C=C bond (II) than from a system of two conjugated double bonds. Sterculic acid, however, polymerizes very rapidly[1], whereas 9,11-octadecadienoic acid is fairly stable at room temperature.

In a more detailed publication we intend to adduce further arguments. Our work has mainly been concerned with the isolation of an as yet unknown 'kapok fatty acid'. The dihydro-bombacic acid (we suggest the name 'bombacic acid' for the unknown 'kapok fatty acid', derived from the family name Bombacaceae) prepared by us appeared to be a C$_{18}$-acid, in contrast to dihydro-sterculic acid, the chain-length (C$_{19}$) of which was verified.

Thanks are due to the management of Unilev N.V., Rotterdam, for permission to publish th communication.

## Paper Electrophoresis of Amino-Acids an Oligopeptides at Very High Potential Gradients

THE importance of the amino-acids and oligo peptides and the complexity of their mixtures ofte encountered stimulate a demand for more powerfu analytical tools to complement those already available. Paper electrophoresis does not show satisfactor resolving power, particularly in the separation o the neutral amino-acids, at the low potential gradient (5–10 V./cm.) usually applied. Its value is greatl

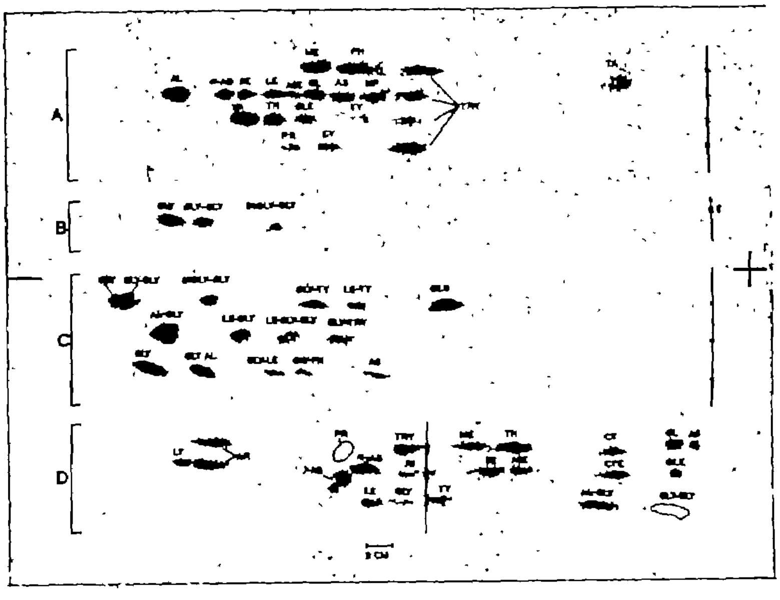

Fig. 1. Electrophoresis of amino-acids and peptides

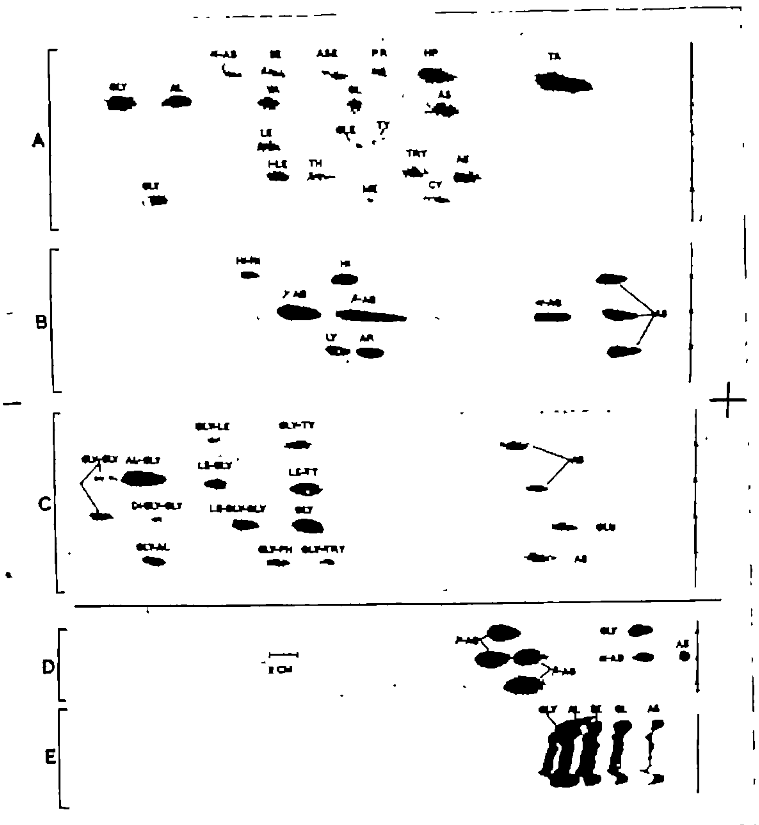

Fig. 2. Electrophoresis of amino-acids and peptides
As in Fig. 1. Conditions: (*A*) 110 V./cm., 2·4 m.amp./cm., Whatman No. 3 *MM* 5 in. × 22½ in. strip, buffer sol., pH 2·9 (454 ml. 2 *M* acetic acid, 6 ml. 2 *M* sodium acetate, 540 ml. water), amount of compounds and place applied as in Fig. 1, 1½ hr. (*B*) 90 V./cm., 2·2 m.amp./cm., ½ hr. (*C*) 110 V./cm., 2·3 m.amp./cm., 1 hr. (*D*) 200 V./cm., 7 m.amp./cm., 2 in. × 11 in. strip, 8 min. (*E*) 200 V./cm., 8 m.amp./cm., 15 min.

enhanced, however, by the application of high potential gradients, most likely because the great reduction in time required for the molecules to traverse a given distance minimizes the detrimental effects of diffusion and moisture changes in the paper strip. Technical difficulties arising from increased heat generation can be overcome by modification of the design of basic equipment and by efficient cooling.

Although Durrum[1] applied a field strength of about 25 V./cm. satisfactorily, it was Michl[2] who first used high potential gradients of more than 40 V./cm., but the shortness of the paper strip used limited his results. Kickhöfen and Westphal, and more recently Heilmeyer *et al.*[3], by adopting Michl's design of equipment and applying potential gradients of up to 120 V./cm., achieved very striking separations of mixtures of chemically and electrically closely related amino-acids and peptides.

My high-voltage technique[4] differs basically from that of the former workers[2,3] in that it is a horizontal closed-strip method with applied pressure and efficient water cooling, allowing the application of 0·7 W./cm.[2] and even more, depending on the temperature of the tap water. The effective length of the strip is 45 cm. A smoothed, full-wave rectified current at up to 6,000 V. is supplied by a power pack, making the application of potential gradients of up to 130 V./cm. possible. In one particular series of experiments 200 V./cm. was applied to a strip of 25 cm. length. A detailed description of the equipment will be published elsewhere[5].

Results obtained using three selected buffer solutions of pH values 2·0, 2·9 and 9·2 are illustrated by Figs. 1 and 2. It is thought that the presentation of results in this form is preferable to the tabulation of mobility values or migration-rates, since separations are often dependent not only upon the differences in migration-rates, but also upon the quality of the spot, that is, its shape, size, tendency to streak, etc. This applies to a lesser degree to bands. Fig. 1 shows the electrophoretic behaviour of twenty-three amino-acids and twelve oligopeptides at pH 2·0 (*A–C*) and pH 9·2 (*D*).

At pH 2·0 (*A*) the positions of some compounds, both absolute and relative to each other, were found to be in disagreement with those reported previously by Kickhöfen and Westphal[3]; for example, tryptophan, serine, proline and tyrosine. In the case of glycine, glycyl-glycine and diglycyl-glycine (*B* and *C*), the pH of the buffer solution appeared to be very critical, as between pH 2·9 and 1·8 the migration-rate of glycine increases rapidly with decreasing pH. On the whole, migration-rates of amino-acids were faster, so that they could be separated in about one-third of the time reported by Kickhöfen, whereas comparable peptides required about the same time. Separation at pH 9·2 offers additional differentiation between methionine and threonine, tyrosine and aspartic acid, cystine and glutamic acid, etc. Fig. 2 shows the electrophoretic behaviour of 24 amino-acids and 13 oligopeptides at pH 2·9.

Of particular interest are the separation of the basic amino-acids (*B*) within half an hour and the exploratory separations at 200 V./cm. of some basic, acid and neutral amino-acids within 8–15 min. (*D* and *E*).

Good reproducibility and speed of process have made electrophoretic separations very helpful in my laboratory for testing fractions of eluate from ion-exchange columns during the run. Used as a second dimension for paper chromatograms, electrophoresis has provided additional and often decisive information on the identity of components of mixtures derived from plant products.

Thanks are due to Mr. H. C. S. de Whalley, director of research, for encouragement, to Mr. S. D. Gardiner for valuable suggestions for the design of electrical equipment, and to the Directors of Tate and Lyle, Ltd., for permission to publish this communication.

## Xylanase in the Soil and the Rumen

In connexion with experiments on enzymatic decomposition of wheat straw xylan[1], the xylanase activity in the soil has been investigated by a method very similar to that of Hofmann[2]. To 5 gm. of air-dry soil in 50-ml. Erlenmeyer flasks were added 2 ml. of toluene, and, after 10 min., 5 ml. phosphate buffer ($p$H 6·5) and 5 ml. xylan solution, or 5 ml. water in the blanks. The stoppered flasks were placed in an incubator at 37° C. and shaken now and then. Samples were taken out by means of a pipette and centrifuged, and reducing power was determined in 1 ml. of the supernatant by the Somogyi method[3]. Soil samples were taken from unfertilized, artificially fertilized and farmyard manured plots in fertilizer experiments at Danish Government field experiment stations.

The xylanase activity was found to vary with the manuring and the kind of crop. The activity was smallest in the unfertilized plots and greatest in the farmyard-manured ones. The variation caused by the crop was, however, much larger; the xylanase activity was three to five times greater after a crop containing xylan (wheat) than after a crop containing no or little xylan (beets); but the same order was observed within each set of samples (plots), activity being smallest in the unfertilized and greatest in the farmyard manured plots.

Recent investigations have shown that a correlation exists between the activity of soil enzymes (saccharase, urease) and fertilization or manuring especially with nitrogen[4,5], and biological activity of the soil as determined by production of carbon dioxide[6].

Portions of 25 gm. of a loam soil ($p$H 6·2, humus 2·2 per cent) from an unfertilized plot with low xylanase activity were incubated in beakers for fifteen days at 25° C., with addition of: (*a*) powdered wheat straw in amounts from 0–2·0 per cent, (*b*) 0·5 per cent xylan, mannan, starch, cellulose, xylose, arabinose or glucose. 10 per cent water and 0·05 per cent ammonium nitrate were added in each case, and evaporated water was restored during incubation. The xylanase activity increased six times due to t incubation with xylan, but only 1·3 times with t other carbon sources (except straw); the resul found in soil incubated with wheat straw are se in Fig. 1.

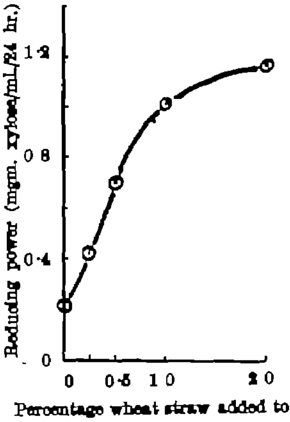

Fig. 1

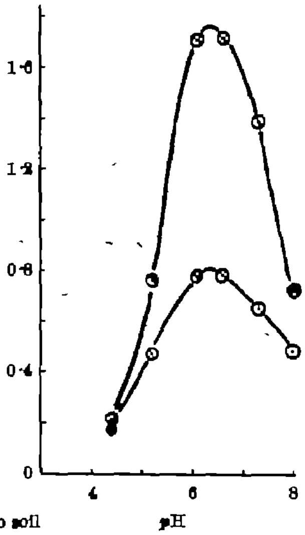

Fig. 2

Fig. 1. Xylanase activity in soil after incubation with increasing amounts of powdered wheat straw

Fig. 2. Xylanase activity in rumen liquid at different $p$H. Upper curve, centrifuged liquid; lower curve, sterile filtrate

The amount of xylanase in the soil appea primarily to be a function of the amount of xyl decomposed in the soil giving rise to an accelerat excretion of the adaptive enzyme xylanase, besid an increase of the microflora, provided that sufficie available nitrogen is present. The small rise in xyla ase activity observed on addition of non-xyla carbon sources may be caused by a general increa of the microflora.

*Xylanase activity in rumen content.* Material large consisting of straw was taken from the rumen of newly slaughtered cow. Juice was expressed fro this material by means of a fruit press and centrifuge to give a liquid almost free of bacteria; part of th liquid was filtered through a bacterial filter (Jena gla filter 11*G*5), and its xylanase activity was measure in the following experiment: stoppered test-tube with 1 ml. of centrifuged or filtered liquid, 1 ml. o phosphate buffer ($p$H 6·2), 2 ml. of 1 per cent xyla solution, 0·5 ml. toluene were incubated at 37° C. and reducing power was determined[3]. Fig. 2 show the xylanase activity at different $p$H values. Th bacteria in the sediment from the centrifugation wer separated from most of the impurities, washed an precipitated in acetone. 10 mgm. of this powde had almost the same xylanase activity as 1 ml. o the liquid.

The xylanase in the soil and the rumen conform in respect of $p$H and temperature optimum with th xylanase from pure cultures. The reaction product have been isolated and determined on paper chromatograms, and xylose, xylobiose, xylotriose, etc., hav been observed, as in studies with xylanase fron pure cultures[1].

A more detailed account will appear later.

## Auxotrophic Mutants of *Pseudomonas aeruginosa*

Auxotrophic mutants of a strain of *Pseudomonas aeruginosa* were isolated by Loutit[1] following X-ray treatment and using a modification of the penicillin-isolation technique devised by Davis[2] and Lederberg and Zinder[3]. An attempt was made to repeat this work using a new strain of *Pseudomonas aeruginosa*; but from a series of ten experiments only one auxotrophic mutant was isolated. A further thirty experiments were carried out on this new strain, using ultra-violet irradiation instead of X-rays and employing the same isolation technique. From these thirty experiments only eleven mutants were isolated, presenting less than 0·2 per cent of the total lonies examined. Six of the eleven mutants were olated in one experiment; but five of these had the me nutritional requirements.

The possible reasons for the inability to isolate utants lay either with the mutagenic agent or the lective technique. Since the mutagenic agent was und to be satisfactory when working with *scherichia coli*, attention was concentrated on the lective technique. One aspect of the selective chnique which was considered was the possibility f genetic exchange, which could occur either as a sult of sexual fusion or some transforming process.

To examine the possibility of genetic exchange, xperiments were carried out by inoculating two utants together into nutrient broth. At the same ime, controls were set up for each mutant using the ame inoculum in half the quantity of broth used for he mixture of mutants. The tubes were incubated vernight, the cells centrifuged, washed twice with terile distilled water and the total cells were spread ver the surface of minimal agar plates prepared sing the medium devised by Davis and Mingioli[4], which would not support the growth of the mutants. The plates were incubated for 24 hr. and the number f prototrophic colonies counted on the plates noculated with the mixed growth and those inocu- ated with the control growth of each mutant. The results of these experiments are shown in Table 1.

Table 1

| Cross | Number of prototrophs | |
|---|---|---|
| | Mixture | Total controls |
| $B_1 me^-$ × $B$[illegible] $me^-$ | 0 (2 ml.) | 0 (1 + 1 ml.) |
| $B_1 me^-$ × $B$[illegible] $me^-$ | 92 (5 ml.) | 8 (2·5 + 2·5 ml.) |
| $B_1 me^-$ × $B$[illegible] $me^-$ | 3,628 (20 ml.) | 447 (10 + 10 ml.) |
| $B_1 me^-$ × $B_{11} h^-$ | 609 (2 ml.) | 183 (1 + 1 ml.) |
| $B_1 me^-$ × $B_{11} h^-$ | 4,593 (5 ml.) | 1,581 (2·5 + 2·5 ml.) |
| $B_{17} ad^-$ × $B_{21} l^-$* | 51 (2 ml.) | 2 (1 + 1 ml.) |

$me^-$ = methionineless; $h^-$ = histidineless; $ad^-$ = adenineless; $l^-$ = leucineless.

* This result was obtained using two mutants isolated in subsequent experiments.

Since the number of prototrophic colonies was greater on the plates inoculated with the mixed mutants than those inoculated separately with individual mutants, there was some justification in assuming that a process of genetic transfer could occur.

In the isolation method, genetic transfer could occur at the stage of incubation of the cells in broth immediately after irradiation and thus prevent the isolation of the mutants. To overcome this difficulty, the technique of Adelberg and Meyers[5] was adapted. In this technique the cells were incorporated in minimal agar after irradiation and incubated for 6 hr., thus isolating each cell from its neighbour and preventing either fusion or transformation. The only modifications necessary to the technique were increases in the amount of penicillin and penicillinase. The quality of the penicillinase was important; a purified product was necessary. Most commercial preparations were unsatisfactory as they were simply culture filtrates containing growth factors. The material used for the present work was prepared in this laboratory according to the method of Morgan and Campbell[6].

Using the Adelberg and Meyers technique, relatively high numbers of mutants were isolated in three separate experiments as shown in Table 2.

These results showed that the penicillin-isolation technique was satisfactory for isolation of mutants, provided the organisms were not grown in broth but in minimal agar for the period of incubation necessary for full expression of the mutants. It is suggested that a process of genetic exchange occurred during that period of incubation in broth, masking any mutants which were present. To confirm that genetic transfer could occur under the conditions used in the early isolation work, two mutants, $B_{17}ad^-$ and $B_{21}l^-$, were grown separately and irradiated. Half the cells of each mutant were then mixed in broth and the remainder inoculated separately in broth. The tubes were incubated for 6 hr., the cells were centrifuged, washed twice in distilled water and spread over the surface of minimal agar plates. The plates were incubated and scored for the appearance of prototrophs. From the mixture of irradiated cells in two experiments, eight and seven prototrophs respectively were found, while there was none in any of the controls. This amount of genetic exchange considered in conjunction with the fact that all mutants do not survive the penicillin treatment would probably be sufficient to prevent the isolation of mutants.

Table 2

| | Number of mutants | Total number of colonies examined after penicillin treatment |
|---|---|---|
| Experiment I | 10 | 70 |
| " II | 25 | 170 |
| " III | 60 | 170 |

## Mode of Cleavage of the Eggs of *Hydroides norvegica* in the Mediterranean

In a recent paper[1], it was pointed out that the eggs of the marine polychaete *Hydroides norvegica* may have different cleavage patterns in the North Sea and in the Mediterranean. Whereas at the Kristineberg Zoological Station (near Fiskebäckskil), on the west coast of Sweden, Wolsky found the early cleavage to be spiral and equal, an earlier observer, Soulier[2], working at Cette (Séte), on the Mediterranean coast of France, found it orthoradial and unequal. It was suggested that this difference may be a sign of differentiation of two distinct physiological races within the species, and it was thought desirable to check the correctness of this suggestion. A short visit to Naples in April 1954 and the hospitality of the Stazione Zoologica, for which I am greatly indebted, made it possible to carry out such a check on Mediterranean material.

As regards the relative position of the cleavage planes, Soulier's finding that the cleavage is orthoradial up to the 16-cell stage could not be confirmed. Spirality can be detected in the 4-cell stage already, and an analysis of camera lucida drawings almost invariably reveals polar furrows (Fig. 1*a*). Consequently, the sudden change of the configuration of the blastomeres from the orthoradial to the spiral type in the 16-cell stage, as described by Soulier,

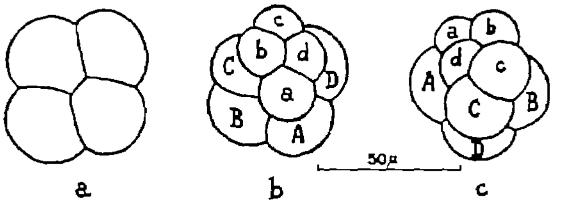

Fig. 1. Cleavage stages of *Hydroides norvegica* in the Mediterranean (Gulf of Naples). (*a*): 4-cell stage showing spirality and polar furrow; (*b*) and (*c*): 8-cell stages showing extreme inequality of blastomeres and irregularity of blastomere arrangement. (In both cases it is the blastomere labelled *C* which seems to have drifted 'out of place')

cannot take place. However there is evidence that blastomeres frequently change their original position relative to each other, and sometimes their configuration is quite irregular (cf. Figs. 1*b* and *c*).

Concerning the inequality of the cleavage, the difference between North Sea and Mediterranean eggs is also less striking than assumed on the basis of Soulier's categorical statement (ref. 2, p. 1662). The 1/8-blastomeres of *Hydroides* eggs are slightly unequal even in the North Sea (ref. 1, Table 1), and therefore the difference between the North Sea and Mediterranean material is rather one of degree than of category.

Circumferences of blastomeres were measured on a number of camera lucida drawings of eggs in the 8-cell stage, and the results are given in Table 1. (The results are in the same arbitrary units as used for the North Sea material, one unit being approximately 9μ.) A comparison of these data with those for North Sea eggs (ref. 1, Table 1) shows that the inequality of the cleavage is somewhat more pronounced in the Mediterranean than in the North Sea material. In the North Sea the size difference of sister blastomeres ranges from 0 to 20 per cent and is on the average 6·5 per cent. (In my earlier paper[1], this figure is given erroneously as 3·5 on pp. 343 and 347, but the correct value can be obtained from the data of Table 1 on p. 343.) In the Mediterranean, on the other hand, the size differences vary between 0 and 39 per cent, and the average is 16·8 per cent, that is, 2½ times the value for the North Sea eggs. This is a definite indication that the cleavage is somewhat more unequal in the Mediterranean than in the North Sea material. However, it is rather difficult to treat these data statistically and to express exactly the degree of the inequality of cleavage or the significance of its difference in two or more populations. For this reason the difference between the Mediterranean and North Sea material as regards inequality of the cleavage cannot be considered as statistically established. Although it very probably exists, further results must be awaited before statistical evidence can be furnished.

Table 1

| Blastomere / Egg | *A* | *a* | *B* | *b* | *C* | *c* | *D* | *d* |

## Demonstration *in vivo* and *in vitro* of Peristaltic Contractions in the Portal Vein of Adult Mammals (Rodents)

In previous investigations evidence has bee produced of a spontaneous peristaltic activity i veins of the hepatic portal system of chick embryo and newly hatched chickens[1] and of adult goldfinche and in the portal vein of adult mice[2], cultivate *in vitro*. In the latter the contractions are ver powerful and of very high frequency (up to 70 pe min.), and activity continues for a long time (up t more than two weeks without washing or renewa of the nutritive medium).

In continuation of these investigations a simila peristaltic activity has been observed in the porta vein of albino rats and guinea pigs, explanted *in vitro*: in the former a frequency of contraction up to 35 per min., in the latter up to 20 per min., have been recorded.

With the aim of ascertaining whether this rhythmical contractile activity occurs also in the vessel *in situ* in the living animal, I have made some observations on albino mice and rats.

For this investigation the following technique has been employed. The animal is anæsthetized by ether and laparatomized; the liver is lifted up and the duodenum displaced to the left, so that the portal vein is exposed. The field is continuously irrigated with a physiological salt solution at 38°–39° C. and a coverslip is placed over it, care being taken not to bear any pressure upon the vessel. It is thus easy to observe rhythmical contractions of the portal vein, with a propagation of the contractile wave in the direction of the liver and a frequency up to 30 per min. in the mouse, up to 14 per min. in the rat. In the state of relaxation of the wall, it is possible to recognize on its surface one or more slight indentations, which correspond to the spiral fold projecting into the lumen, which has been described in the portal vein of these and other mammals[3,4].

If the animal is killed, for example, by administration of a large dose of ether, the peristaltic activity persists for some hours with remarkable intensity; indeed, the activity can be studied more easily, as the respiratory excursions of the diaphragm, which cause rhythmical movements of the liver and of the vessels attached to it, no longer interfere with observations. After the death of the animal a frequency of the contraction up to 52 per min. in the mouse and up to 22 per min. in the rat has been recorded.

Half an hour to one hour after death it becomes possible, owing to the sedimentation of the blood cells and the transparency of the plasma and of the venous wall, to perceive within the lumen, in the phase of relaxation of the vessel, the spiral fold already mentioned; during the contraction of the vein the spiral fold seems to be incorporated in the wall, so that it becomes for the most part invisible.

The function of this fold, as well as that of similar spiral structures projecting into the lumen described within the portal vein of other mammalian species[4-6], is probably, according to Barnett, to mix the various streams of blood that enter the portal vein, so that the different lobes of the liver can all receive the same kind of blood. This is especially important in animals possessing multilobed livers, and as a matter of fact in these animals spiral structures are particularly well marked.

As regards the rhythmical peristalsis of the portal vein, it seems safe to assume that it plays a part in the propulsion of blood towards the hepatic capillary bed.

Further researches in this direction are in progress.

## Rust Resistance in Sunflowers (*Helianthus annuus* L.)

Rust (*Puccinia helianthi* Schw.) is a major hazard to sunflower production in a number of countries. The area devoted to sunflowers for edible oil in Canada, all in southern Manitoba, was reduced from 60,000 acres in 1949 to 3,500 in 1952, largely because of losses from rust. The Argentine crop was severely damaged by rust in 1952–53. In Peru, where sunflowers were grown for fodder, rust has practically eliminated the crop. The search for rust resistance is therefore a prime objective in sunflower breeding. The present communication is a preliminary report on resistance which has been discovered in the Canadian sunflower investigations.

Three sources of rust resistance have been recognized to date. The first resistant plant was found in 1949 in an $F_2$ population of the natural cross, Sunrise × Texas Wild Annual, in a field nursery. Seedlings from selfed seed of this plant proved resistant to rust when inoculated in the greenhouse. Field-grown plants of the progeny were used as male parents in crosses with rust-susceptible inbred lines of commercial agronomic type. The $F_1$ populations contained plants which were only lightly infected in the field in 1951, the year of the severest rust outbreak ever recorded in Canada. One hundred and thirty-three lines of later generations, selected on the basis of agronomic type from 1,500 lines, averaged only 9·6 per cent rust infection in the field compared to an average of 26·9 per cent in susceptible check material. From the 133 lines, 320 plants with 5 per cent or less rust were selfed. Seedlings derived from them were inoculated in the greenhouse with three different single-pustule isolates of rust. On the basis of reaction type, 70 per cent of the progenies showed resistance. Twenty-six progenies were grown in isolation and allowed to interpollinate to produce the recently licensed rust-resistant variety Beacon. Several inbred lines from the same source have uniformly low rust infections, in some cases less than 1 per cent when susceptible check plants have 10–90 per cent.

The second source of rust resistance was one large plant discovered in 1951 in the $F_3$ progeny of the natural cross California Oilseed × Texas Wild Annual. When eleven seedlings from open-pollinated seed of this plant were inoculated with the three isolates of rust mentioned above, six proved resistant and five susceptible. Seed of fifty-eight selfed plants of the same progeny yielded two outstanding lines in the field in 1952. Of thirty plants in the two lines, eleven were free of rust, fifteen had only one or very few pustules, and four had one or a few pustules on most leaves. Several other lines also contained plants which were free of rust. Nearby check plants had 20–80 per cent infection.

Selfed progenies of twenty-one plants from the two lines mentioned above were inoculated in two tests with three isolates of rust in the greenhouse in 1952–53. Ten of the twenty-one progenies were resistant in all inoculations; the others segregated. Derivatives of the ten progenies continue to show high field-resistance in later generations. Sunflowers with the same parentage have also proved resistant to rust in the field in Peru and Argentina.

The third source of resistance was one plant with low rust infection in a field plot in 1952 from seed of open-pollinated plants of the variety Hopi. The second selfed generation from this plant, tested in the greenhouse with a field collection of rust, contained twenty-five resistant and twenty-four susceptible seedlings. Eleven third-generation selfed progenies, each with eight to fifteen plants, were grown in the field. One progeny had 1 per cent or less rust on all plants; two progenies had 2 per cent or less; and seven progenies had 5 per cent or less. Adjacent susceptible plants had up to 90 per cent infection.

The first two of the three sources of resistance are assumed to have been derived from wild *Helianthus annuus* L., on the basis of plant type in the segregating populations, and because of the absence of other wild annual species of *Helianthus* in the region of Renner, Texas, where the seed originated. As the rust-resistant Hopi plant came from open-pollinated seed produced at Renner, it may also have derived its resistance from the wild *H. annuus*. Although wild forms of *H. annuus* occur over a large part of the North American plains, including the sunflower-growing region of Canada, no rust resistance has been recognized from any location other than Renner.

Studies are now in progress to determine if the same genes are involved in all three sources of rust resistance, and to determine the inheritance of resistance from each of the three sources when crossed with susceptible plants.

Fuller reports of these and related investigations will appear elsewhere. We acknowledge the contributions made to this work by Dr. W. A. Russell during 1949–52, while he was at the Experimental Station at Morden, and by Mr. A. M. Brown, Plant Pathology Laboratory, Winnipeg, during 1949–50.

## Termination Reaction in Vinyl Polymerization: Preparation of Block Copolymers

THE nature of the termination reaction in vinyl polymerization, that is, the question of disproportionation or combination of polymeric free radicals, has been the subject of controversy. A number of methods have been used for distinguishing between the various possibilities[1–4]; these depend on relations between degrees of polymerization measured by osmotic pressure and end-group analysis, or on relations between rate and molecular weight data. In all these cases the extremes of 100 per cent disproportionation of radicals and 100 per cent combination give rise only to a difference of a factor of two in the appropriate quantity which is compared with experiment. These methods have been applied to comparatively few monomers, and results obtained by different groups of workers have not always been in agreement[3,4]. We therefore thought it worth while to attempt to devise an independent method of general application which would be more sensitive in its distinction between combination and disproportionation. We now wish to describe briefly the method which has been developed and its application to four vinyl monomers.

The method depends on the use of an initiator containing functional groups so arranged that every free radical produced contains one such group. If the conditions of polymerization are such that chain transfer to monomer, solvent and polymer is negligible, each growing radical will carry one functional group at its inactive end; hence the final polymer molecules will have a functional group either at one or both ends, depending on whether termination occurs by disproportionation or combination of radicals. (The argument so far is identical with that employed in methods involving the use of labelled initiators.) The two types of polymer may readily be distinguished by reaction with an equivalent of a bifunctional reagent capable of linking the polymer molecules by their terminal functional groups. If termination occurs exclusively by disproportionation, the polymer molecules can only be joined in pairs, so that the number average degree of polymerization can increase at most to twice its initial value (neglecting the molecular weight of the ligand). On the other hand, if termination occurs exclusively by combination, theoretically *all* the polymer molecules could be joined together, and under suitable conditions the degree of polymerization would be expected to increase to much more than twice the initial value. Both types of behaviour have been observed.

One initiator employed was γγ′-azo-(γ-cyano-*n*-valeric acid), which decomposes thermally to yield radicals of structure, $HOOC(CH_2)_2\dot{C}(CH_3)CN$. After polymerization and purification of the polymer by repeated precipitation, the carboxyl content was estimated by titration. A sample of the polymer was converted into the corresponding acyl chloride by treatment with thionyl chloride, the excess of which was then removed in vacuum. Coupling was carried out in methyl ethyl ketone solution at 90° C., using 1 : 6 hexane diol or 1 : 10 decane diol. After precipitating and drying the polymer, its intrinsic viscosity was measured and compared with the original value. Some results are shown in Table 1. In each case we have taken $1/\alpha = 1{\cdot}40$, $\alpha$ being the Houwink constant.

Table 1

| Monomer | Conditions of polymerization | Intrinsic viscosity (decilitres per gm.) Initial $[\eta]_i$ | Final $[\eta]_f$ | $\left(\frac{[\eta]_f}{[\eta]_i}\right)^{1/\alpha}$ |
|---|---|---|---|---|
| Styrene | 100°, in *o*-dichlorbenzene | 0·143 | 0·618 | 11·5 |
| | ,, | 0·143 | 0·797 | 11·1 |
| Methyl methacrylate | 90°, in benzene | 0·145 | 0·201 | 1·59 |
| | ,, | 1·145 | 0·210 | 1·69 |
| Vinyl acetate | ,, | 0·169 | 0·254 | 1·76 |
| | ,, | 0·169 | 0·268 | 1·92 |
| Methyl acrylate | ,, | 0·183 | 0·220 | 2·08 |
| | ,, | 0·183 | 0·227 | 2·11 |

The results show that chain-termination occurs substantially by combination in the case of styrene, and by disproportionation with the other monomers. Our conclusions agree with those of Mayo, Gregg and Matheson[1], Baysal and Tobolsky[2] and Bevington-Melville and Taylor[4] for styrene, and with Bevington *et al.*[4] for methyl methacrylate.

The use of initiators of the type described, together with suitable coupling reactions, obviously enable a large range of block copolymers to be prepared in a simple manner. For example, a block copolymer of styrene and methyl methacrylate in which the molecules contain one block of about a hundred units of styrene between two blocks of methyl methacrylate each of approximately 120 units has been prepared in the pure state, free from the parent polymers. These preparations may be scaled up without difficulty.

This work is being extended to other monomers and to different conditions of polymerization, including the use of other initiators. We hope to publish a more quantitative treatment elsewhere.

We wish to thank Dr. W. A. Waters, of the Dyson Perrins Laboratory, Oxford, for providing us with practical details of the synthesis of γγ′-azo-(γ-cyano-*n*-valeric acid).

## Density of Amorphous Polyethylene Terephthalate

POLYETHYLENE terephthalate can be melt-spun and afterwards hot-drawn to form continuous filament yarn[1] marketed under the trade name of 'Terylene'. In the quenched or spun form, it possesses a very low degree of molecular orientation, and the X-ray diagram shows a characteristic amorphous halo with no evidence of crystalline reflexions. The density of this amorphous form is 1·335 gm./c.c., whereas the calculated crystallite unit-cell density is 1·455 gm./c.c.[2]. With the onset of crystallinity, indicated by an increase in density, the growth of crystallite reflexions in the X-ray diagram, and an increase in the brittleness of the sample, the amorphous halo in the X-ray diagram disappears and hence no X-ray estimate of the degree of crystallinity is possible. It can, however, be estimated from the ratio of the infra-red absorptions in the 898 cm.$^{-1}$ and the 875 cm.$^{-1}$ bands[3], and from the density.

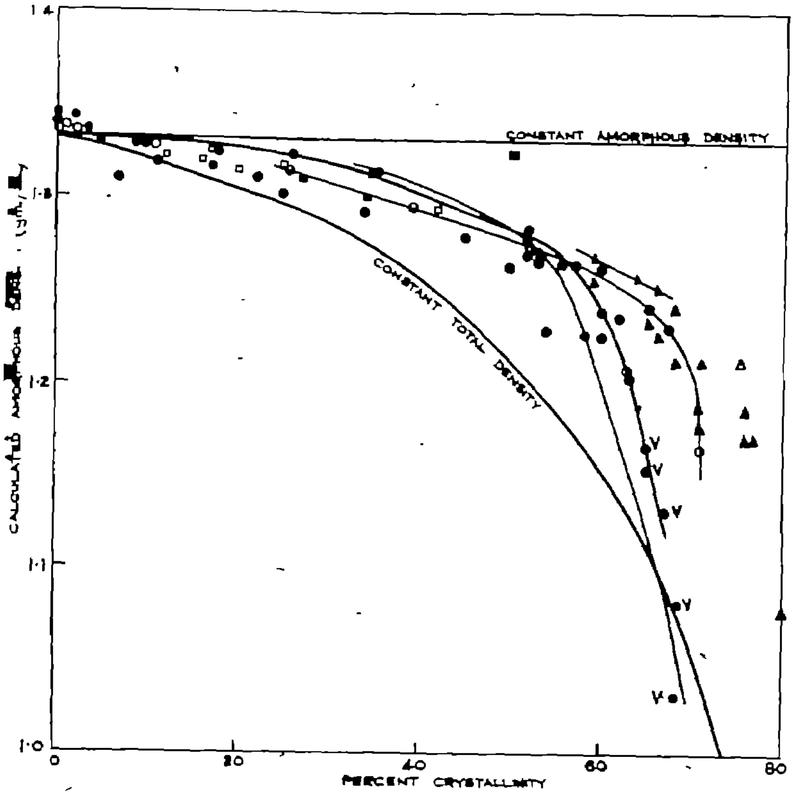

Fig. 1. Calculated amorphous density (gm./c.c.) *vs.* percentage crystallinity

▲, Production 'Terylene' polyester yarns; ▲, Production 'Terylene' polyester yarns (heat-set); ●, yarns spun at low speed; ○, yarns spun at high speed; ○, ⊕, ⊟, other experimental yarns; ⊞, unoriented crystalline polymer; *V* denotes presence of internal needle-shaped voids

It has been found that these two measures disagree, the density estimates being considerably lower than the infra-red estimates. Previous work on polyethylene[3] has shown a similar situation in which the crystallinity estimate obtained from the density of the sample is less than that obtained from X-ray data. With increasing hot-stretching of polyethylene terephthalate, the density rises to a flat maximum or even actually decreases, whereas the birefringence, the initial tensile modulus and the infra-red absorption ratio all continue to rise. Furthermore, at high stretch ratios, microscopic voids sometimes appear. These observations thus suggest that the density estimate of crystallinity is suspect, while the infra-red estimate agrees with the other data, increasing uniformly with increasing stretching and heat treatment. Whereas infra-red estimates of up to 80 per cent crystallinity have been obtained, the highest density estimate obtained from a large number of measurements of highly crystalline material is 55 per cent.

Table 1

| Polyethylene terephthalate filaments | Density of sample | Crystallinity | |
|---|---|---|---|
| | | Density estimate (per cent) | Infra-red estimate (per cent) |
| Non-crystalline, non-oriented | 1·335 | 0 | 2 |
| Partly crystalline, non-oriented | 1·385 | 42 | 48 |
| Highly crystalline, highly oriented | 1·390 | 46 | 65 |
| | 1·389 | 45 | 76 |
| | 1·381 | 38 | 80 |

Assuming the validity of the infra-red estimate, and knowing the density of the sample and the calculated crystallite density, the corresponding densities of the amorphous region have been calculated for drawn yarns produced under a wide range of conditions and are given in Fig. 1. This shows that the amorphous density decreases with even a small amount of crystallinity, and falls very rapidly at high crystallinities: an increase in the spinning speed, and also a heat treatment after drawing, delay the reduction in density. At the lowest amorphous densities, needle-shaped voids appear at the centre of the filament without any discontinuity in the curves, suggesting that similar voids of submicroscopic size may exist at higher amorphous densities.

It is thus concluded that the amorphous region gradually changes character as crystallization proceeds, and the data suggest the gradual appearance of a fibrillar structure in general qualitative agreement with electron microscope and low-angle X-ray results[4].

The effect of random crystal growth on the amorphous regions would be expected to be less than that due to crystallization which accompanies drawing, on account of the absence of external stress, and Table 1 shows that the density estimate for the former is in better agreement with the infra-red crystallinity estimate.

## Acid Character of Some Phenolic Resins in Relation to their Structure

AQUEOUS suspensions of finely ground phenol formaldehyde, resorcinol formaldehyde and phloroglucinol formaldehyde resins gave potentiometric titration curves each of which showed an inflexion at a pH between 11·0 and 12·0. The amounts of phenolic hydrogen in the three resins indicated by these inflexions were in approximate agreement with the values, 898, 1,563 and 2,083 milliequivalents per 100 gm. calculated from the formulæ, $C_6H_3(OH)(CH_2)_{1\cdot5}$, $C_6H(OH)_2(CH_2)_{1\cdot5}$, and $C_6(OH)_3(CH_2)_{1\cdot5}$, of the repeat units contained in the three resins respectively.

Titration with a dilute base, for example, dilute potassium hydroxide, revealed additional inflexions at lower $pH$ values, as can be seen from Fig. 1. Phenol formaldehyde showed an inflexion at $pH$ 10·3. The acidity calculated at this inflexion was only about 57·0 m.equiv. per 100 gm. Resorcinol formaldehyde gave two inflexions corresponding to acidities of about 58·0 and 115·0 m.equiv. per 100 gm. Three inflexions were found in the case of phloroglucinol formaldehyde, indicating acidities equal to 55·0, 110·0 and 162·0 m.equiv. per 100 gm. These values were found to be independent of the particle-sizes of the resins and they were obtained, subject to variations of less than ± 2·0 per cent, as often as the resins were prepared with an acid or an alkali as the catalyst, and with any molecular ratio between 1·5 and 3·0 of formaldehyde to the phenolic compound.

The cataphoretic velocity (in cm./sec./volt/cm.) of the resin particles, when plotted against added potassium hydroxide, showed a maximum corresponding to each inflexion (see Fig. 1), the second and the third inflexion of phloroglucinol formaldehyde being covered by a flat maximum. The potassium ion activity of the suspensions measured with the help of clay-membrane electrodes[1] also showed sharp changes corresponding with the inflexions in the $pH$ curve.

These inflexions are therefore real. They indicate the neutralization of hydroxyl groups which, apparently, have a stronger acid character than the majority of the hydroxyl groups present in the resin. It is possible that some benzene nuclei are not attacked at all three points by the formaldehyde, and if one assumes that the 'strong' hydroxyl groups are attached to such nuclei, one readily sees why, as noted above, the number of additional inflexions is the same as that of hydroxyl groups present per benzene nucleus. The amount of acid neutralized at the last additional inflexion bears to the total quantity of phenolic hydrogen a ratio which varies from 1:13 to 1:15 in the three resins, and this indicates, in the light of the above assumption, that one in about fifteen benzene nuclei is not attacked at a three points by the formaldehyde. This slig deficiency in cross-linking does not make an appr-ciable difference between the total quantity phenolic hydrogen actually found on titration an that calculated on the assumption that complet cross-linking had taken place.

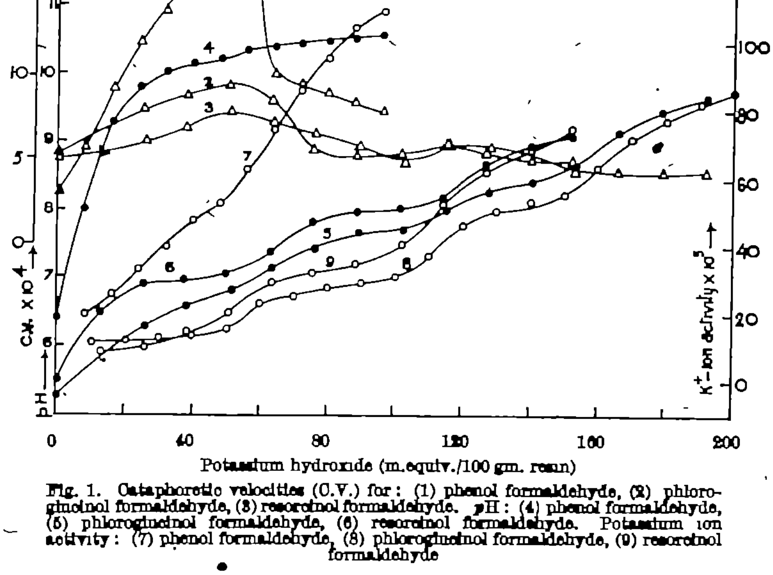

Fig. 1. Cataphoretic velocities (C.V.) for: (1) phenol formaldehyde, (2) phloroglucinol formaldehyde, (3) resorcinol formaldehyde. $p$H: (4) phenol formaldehyde, (5) phloroglucinol formaldehyde, (6) resorcinol formaldehyde. Potassium ion activity: (7) phenol formaldehyde, (8) phloroglucinol formaldehyde, (9) resorcinol formaldehyde

Additional inflexions similar to those reporte above have also been found with several other typ of solid condensation polymers. Details and fulle discussion will be published elsewhere.

## A New Class of Compounds containing the Pentacyanoferrate Group and an Unpaired Electron

RECENT work in this Laboratory has establishec the existence of a class of compounds containin anions of the general formula $[\mathrm{Fe^{II}(CN)_5}R_1\dot{\mathrm{N}}R]^{3-}$. Here $R$ is an aromatic nucleus which may carry certain substituents and $R_1$ may be a hydrogen atom or an alkyl group such as a methyl or an ethyl radical. The dot over the nitrogen atom in the formula represents an odd, unpaired electron which, for convenience, is shown associated with a nitrogen atom.

The sodium salts of many of these anions are very soluble in water and give rise to intensely coloured solutions. The maximum extinction coefficients are often comparable with those of dyestuffs. Thus the logarithm to the base 10 of the maximum extinction coefficient in the visible region of the salt $\mathrm{Na_3[Fe(CN)_5H\dot{N}C_6H_4OH]}$ prepared from $p$-aminophenol is 4·29, which may be compared with values of 4·5 and 5·0 for malachite green and crystal violet respectively. Several of these compounds (for example, that derived from $p$-aminophenol) are relatively stable and have half-lives of many days in aqueous solution in the presence of air.

The solubilities of the salts of these anions are generally similar to those of the corresponding ferrocyanides; but the groups $R$ and $R_1$ have some effect on the solubilities. As several of the heavy-metal salts are insoluble in dilute aqueous acetic acid, and as many of these salts are intensely coloured solids, it is probable that solutions of the sodium salts of these complexes will find application as colour reagents for paper chromatography.

These complexes can be made conveniently by allowing the appropriate aromatic amine to react with a faintly alkaline solution of disodium pentacyanoammino-ferrate, that is, with the salt

$_3[Fe(CN)_5NH_3]$. For example, *p*-aminophenol acts with this salt to give the anion e$^{II}$(CN)$_5$H$\dot{N}$C$_6$H$_4$OH]$^{3-}$; but many amines give a ore complicated reaction. Thus aniline yields the ion [Fe$^{II}$(CN)$_5$H$\dot{N}$C$_6$H$_4$NHC$_6$H$_5$]$^{3-}$, identical with at obtained by the reaction of *p*-aminodiphenyl-aine with disodium pentacyanoamminoferrate.

Although the iron in these compounds is in the valent state, yet strong reducing agents (for ample, sodium hydrosulphite) destroy the com-exes and release the corresponding amine, $RR_1$NH. is reaction provides a method for the identification the organic radical in a complex. For example, duction of the complex prepared from aniline yields aminodiphenylamine and not aniline.

Unique syntheses may be carried out with the aid these compounds. For example, *p*-aminodiphenyl-nine can be prepared directly from aniline, and : 7-dimethylphenazine (Chemical Society Number-g System) can be made in 40 per cent yield from toluidine in a single step.

Full details of the preparation and behaviour of ese substances, together with evidence of their ructure, will be published elsewhere. The work scribed has been carried out as part of the research ogramme of the Chemistry Research Board, and is communication is published by permission of the irector, Chemical Research Laboratory

## A New Model Material for Photoelasticity

Gelatin, and a number of imported plastics like atalm 800', '*BT*.61-893', '*CR*-39', 'Marco Resin', c., are commonly used as model materials. Gelatin optically more sensitive than all other materials, ut has some disadvantages. The stress-optical ensitivity of gelatin[1] varies considerably with the elatin concentration, glycerine content and tem-erature; the recommended working range of tem-erature is 14°–19° C.[2]. In the tropics, the gelatin mix very weak elastically at room temperature, whereas gar has proved to be more stable.

I have used agar as the model material for photo-lastic experiments. This material is cheap, easily vailable, and very widely used in preparing solid edia for bacteriological work; and the models can asily be prepared from it. The stress-optic sensitivity f this material has been calculated from the fringe ystem obtained with a model of a circular disk in iametral compression, and is found to be better than ther plastic substances and as good as gelatin itself.

The fringe constant of the material is found to be s low as 0·08 lb./sq. in./fringe/in. thickness (approx-mately) for 2–3 per cent agar concentration at 29° C. using an analyser as the compensator). For 15 per ent gelatin models this value is as high as 0·14[3]. hough low, the Young's modulus of about 14 lb./sq. n. for 5 per cent agar (obtained by loading a free ample without any side support) compares favourably vith the figure 6 lb./sq. in. for 13 per cent gelatin.

An attempt to increase the Young's modulus and he stress-optic sensitivity of the material in com-ination with other ingredients is being made and he results will be published elsewhere.

I am much obliged to Messrs. T. Ramasarma and . J. Mohanrao, research students of the Bio-chemistry Department of this Institute, for discussions and suggestions in the preparation of the model material.

## Spot Chromatography of Hydraulic Mineral Oils using Fuller's Earth

The recent communication by L. H. Bryant[1] on an adsorbent-coated glass technique for circular chromatography of terpenes, etc., was read with interest. A rather similar method was developed in this laboratory in 1948, and various adsorbents were tried; pulverized silica gel appeared to cause some alteration (darkening) in certain of the mineral hydraulic oils tested, so its use was discontinued and ordinary fuller's earth (B.P. grade) used instead. This material (prepared as a trichlorethylene slurry poured on the glass to form a pool and then rapidly poured off to leave a thin film, which is allowed to dry in air) has proved consistently satisfactory. Spot tests made with it provide a convenient means of checking the consistency of different batches of mineral oils by examining the fluorescence of the rings containing the various oil constituents, using ultra-violet light from a mercury in quartz lamp fitted with a Wood's glass filter.

## A Simple Version of Bragg's X-ray Microscope

The method described by Bragg[1] for the artificial production of the image of a crystal structure from its X-ray diffraction pattern is of fundamental importance in the subject of X-ray optics. The experiment, however, requires the use of two accurate lenses which may not be available in most laboratories, and it is the purpose of the present brief communication to show how simpler apparatus can be made to serve the same purpose.

The simplification consists merely in making a small diffracting mask. This may be accomplished in a number of ways[2], but we have found that simple photographic reduction of a drawing is sufficient; over a distance of about 2 mm., a photographic plate is often sufficiently uniform for the optical thickness to be reasonably constant. Moreover, with a small diffracting mask the angles of diffraction are large enough for a lens of long focal length to be unnecessary for viewing the diffraction pattern.

The experiment has been carried out as follows. A drawing (Fig. 1) was made of the *h0l* weighted reciprocal-lattice section of nickel-phthalocyanine.

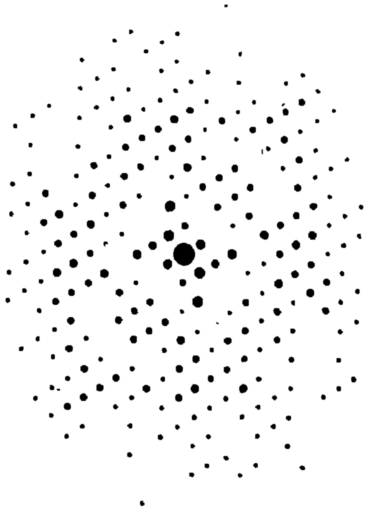

Fig. 1. Weighted reciprocal-lattice section of 'rhodium' phthalocyanine

This crystal nearly satisfies the condition that all the structure factors should be positive, but a few of appreciable magnitude are negative[2]; these were removed by the general addition of a positive scattering factor, so that the results corresponded to a central atom of atomic number 45 (rhodium) instead of 28. The spots in Fig. 1 were given areas roughly proportional to the structure factors. At first sight it may seem that the areas should be proportional to the intensities of the corresponding X-ray reflexions, but this would be so only if the dimensions of the diffraction pattern of a hole were independent of the size of the hole; it can easily be shown that the amplitude at the centre of the diffraction pattern of a circular hole is proportional to the area of the hole.

The drawing was photographed down directly to about 2 mm. diameter on a maximum-resolution plate. An ordinary telescope was then focused on a hole of 5 mm. diameter, about 10 metres distant, illuminated by filtered light from a compact-source mercury-vapour lamp. When the photograph of the reciprocal-lattice section was placed in front of th objective of the telescope, an image of the phthalocyanine molecule could be clearly seen around th central maximum. An improved image (Fig. 2a) wa obtained by covering the diffracting object with thin film of cedar-wood oil held in place by a microscope coverslip. Comparison with the calculate Fourier synthesis[3] (Fig. 2b) shows that the image a reasonable representation of the molecule.

Although the demonstration is valuable chiefly as teaching device for those departments that stress th relationship between physical optics and X-ra diffraction, it is hoped also to explore its usefulnes in connexion with the Fourier and Patterson method for general crystal-structure work.

## Evaporation of Water from Soil under Field Conditions

Canavan[1] has shown that, under field condition at Wellesbourne, very small deficits of soil moistur may adversely affect the germination of many kind of vegetable seeds and the subsequent establishmen of the crop. Further investigations have shown tha the top inch of a seedbed on light sandy loam contains approximately 0·30 in. of water, not all o which is available for germination.

On the basis of laboratory experiments, Penman concludes that, under summer conditions, evaporation of water from a bare soil takes place at th same rate as evaporation from a free water-surfac until a certain critical deficit is reached, approximately 0·35 in. Work during the summer of 195 at Wellesbourne has shown that several factors ma change the relationship between rate of evaporatio from bare soil and from a water-surface.

A number of undisturbed core of soil were taken from a seedbed which was at field capacit and were enclosed in water tight containers. They wer then replaced in the seedbe Similar containers were fille with water and were placed i the seedbed adjacent to th soil cores. All the surfaces wer protected from rainfall by a movable glass shelter. The rate of evaporation from the soil an from the water surfaces wer compared by daily weighing o the respective containers.

When the total evaporatio from the soil surfaces was plotte against total evaporation fron free water-surfaces, the curv showed two distinct stages. I the first stage, the loss was equa to the water-loss; but in th second stage the soil-loss becam

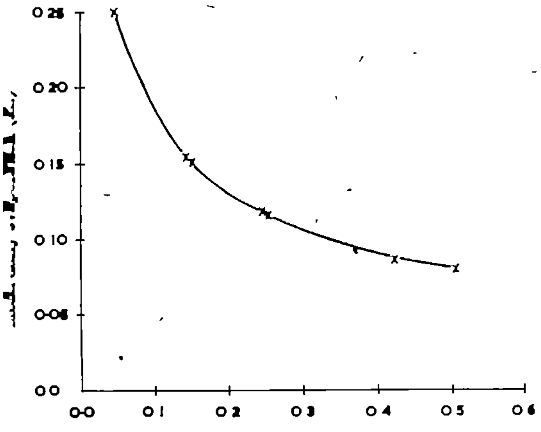

Fig. 1. Relationship between intensity of evaporating conditions and water loss from soil during the period when loss from soil surface equals loss from water surface

ogressively less. Fig. 1 shows the mean daily loss uring the first stage plotted against the total loss the end of this stage. The duration of the first age depended on the intensity of the evaporating nditions during this period.

Such a relationship between intensity of evaporing conditions was to be expected, for in 1907 uckingham[3] showed in laboratory experiments that e greater the intensity of evaporating conditions e sooner did evaporation-loss exceed the supply moisture to the surface by capillarity, thus reucing subsequent loss by the formation of a surface ulch of dry soil.

As the evaporation-rate is governed by capillary pply as well as by evaporating conditions, any il factor which reduces capillary movement may e expected to reduce the evaporation-rate. Field periments have indicated that differences between e apparent specific gravity of a number of soil ores altered the relationship between the rate of ater evaporation from the soil-surface as compared ith that from a water-surface.

In other experiments it was found that the modication of the soil structure brought about by sieving fluenced the rate of evaporation of water from the il surface independently of the apparent specific ravity of the soil. This may explain differences etween results obtained in these field experiments, n which the natural structure of the soil cores was ndisturbed, and laboratory experiments in which eved soil was used[1]. Further experiments at Wellesourne have shown that even small differences in the moisture content of the surface layers affected the rate of evaporation.

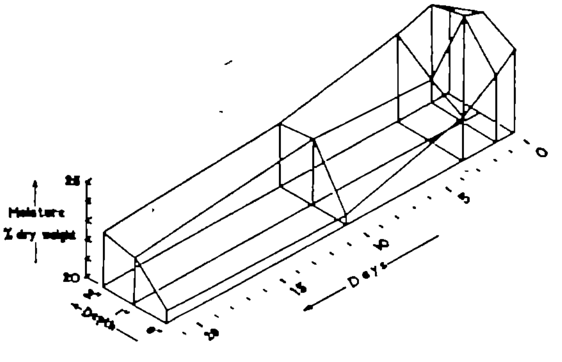

Fig. 2. Progress of drying in the top 3 in. of a seedbed

Staple and Lehane[4] have shown recently that the capillary movement of water in an unsaturated soil was affected by apparent specific gravity and moisture content, and they have described a method of estimating the rate of capillary movement from these two factors.

Detailed knowledge of the factors influencing the rate of capillary movement and a consideration of the intensity factors of evaporating conditions would enable the overall soil moisture deficit to be estimated more accurately than Penman's purely meteorological methods at present permit[5].

In addition to the overall deficit, it is desirable to know the progress of drying at various depths in order to determine the moisture environment of seeds sown in the soil. Fig. 2 shows the progress of drying in the top 3 in. of a seedbed exposed to slow evaporating conditions. After three days, the drying zone extended to 2 in. in depth, and half the deficit was in the top inch of the seedbed. After twenty-one days the deficit was demonstrable to a depth of 3 in., 55 per cent in the surface inch, 29 per cent in the second inch and 16 per cent in the third inch.

These studies of evaporation in the field are being continued, the aim being to establish the relationship between apparent specific gravity, moisture content and evaporation under the yearly cycle of evaporating conditions, and to investigate their effect on the drying of soils at various depths.

This work was done at the National Vegetable Research Station during the tenure of a Ministry of Agriculture Scholarship.

# Effect of Temperature and Initial Moisture Content on the Heat of Wetting of Wood

THE results of tests by Shipley, Campbell and Maass[1] and Clarke (unpublished results), and also of tests at the Forest Products Research Laboratory (Department of Scientific and Industrial Research)[2], clearly show that the variation in the specific heat of cellulosic materials with moisture content does not follow the relation for simple mixtures. Assuming the specific heat of the cellulose to be unchanged, the apparent specific heat of the sorbed water has been calculated to be as high as 1·8 times the value for liquid water.

It can be shown thermodynamically[3] that if the heat of sorption is dependent on the temperature, $T$, the following relation holds:

$$c_m = \frac{1}{1+m}\left\{mc_w + c_s + \left(\frac{\partial \Delta H}{\partial T}\right)_{p,m}\right\} \qquad (1)$$

where $\Delta H$ is the integral heat of sorption, defined as the heat absorbed when $m$ gm. of sorbate are sorbed

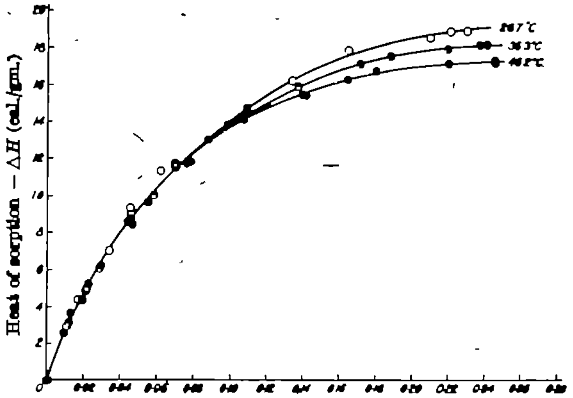

Fig. 1

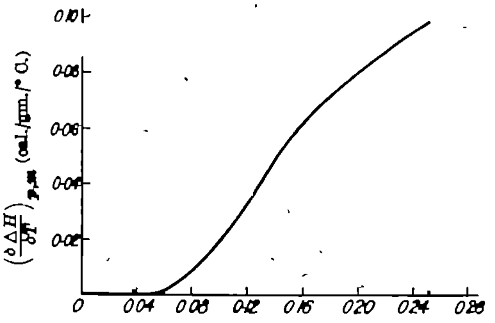

Fig. 2

by 1 gm. of pure sorbent, and $c_m$, $c_s$ and $c_w$ are the specific heats at constant pressure of the sorbent at moisture content $m$, of the pure sorbent, and of the water, respectively. Wahba and Nashed[4] found that the heat evolved on wetting dry cellulose decreased with an increase in temperature, that is, at saturation $\partial \Delta H/\partial T$ was positive, and they concluded that the specific heat of the sorbed water at saturation is greater than that of liquid water.

We have determined the heats of immersional wetting of wood samples having initial moisture contents, $m$, ranging from 0 to 0·24 gm./gm. The tests were made at three different temperatures using an adiabatic calorimeter of the type described by Hirst and Kerridge[5]. Matched samples of ground klinki pine (*Araucaria klinkii* Lauterb.) were used, the experimental conditions being chosen so that wetting occurred as rapidly as possible. The heat of sorption, $\Delta H = \int_0^m \left(\frac{\partial \Delta H}{\partial m}\right)_{T,p} dm$, was obtained by subtracting the calorimetrically measured heat, $\int_m^{\text{sat.}} \left(\frac{\partial \Delta H}{\partial m}\right)_{T,p} dm$, from the heat of wetting of dry wood.

The variations of $\Delta H$ with both temperature and moisture content and of $(\partial \Delta H/\partial T)_{p,m}$ with moisture content are shown in Figs. 1 and 2 respectively. The results confirm the observations of Wahba and Nashed, the quantitative agreement between the two sets of data being quite good since, in both cases, the value of $(\partial \Delta H/\partial T)_{p,m}$ at saturation is 0·4–0·5 per cent of $\Delta H$ for a rise in temperature of 1° C.

Our results show that the value of $(\partial \Delta H/\partial T)_{p,m}$ decreases with decreasing moisture content. At very low moisture content its value is zero (within experimental error), and this is confirmed by the res of Taylor's isosteric measurements[6] at low relat vapour pressures, which showed that the differen heat of sorption $(\partial \Delta H/\partial m)_{T,p}$ for viscose rayon independent of temperature at all moisture conte less than 0·02 gm./gm. Shipley, Campbell and Ma found that for bleached sulphite pulp at a moist content of 0·02 gm./gm. the apparent specific h of the sorbed water, measured between 5° and 25° was 1·13, this being the maximum value obser at any moisture content. From equation (1), corresponding value of $\partial \Delta H/\partial T$ at this moist content is 0·0026 cal./gm./° C.; but this deviat from zero is within the experimental error of tests.

The present results clearly show that the eff of temperature on the heat of sorption is adequ to account for the departure of the specific he moisture content relation for cellulosic materi from that for simple mixtures. Since the effect m be regarded as being significant compared with perimental error only at moisture contents grea than 0·12 gm./gm., it is suggested that the ene of binding of the most strongly held water is relativ unaffected by temperature.

## Fitness of Microcythæmics : a Correctio

I MUST apologize for an error I made in a co munication[1] about the fitness of microcythæm heterozygotes, published in *Nature* by Silvestro Bianco, Montalenti and myself. I am grateful Dr. T. E. Reed (University of Michigan) for pointi out that, in Table 2 of that communication, the seemed to be an excess of *MM* among sibs as co pared with the theoretical number if calculated fro the proportion of *Mm* among the parents, given the communication as 0·101. This query gave the opportunity of rechecking the data and findi the error.

Actually, in Table 2 the proportion of *Mm* paren should have been given as 0·1496, and therefore t direct estimates and theoretical values for the fi nesses would have to be accordingly recalculate However, I do not propose to do this here, becau a careful examination of the data in the light of t criticism made by Dr. Reed has convinced me tha in fact, the data from which Table 2 was prepar were biased by incompleteness of ascertainme among parents and even more so among sibs (f example, only those families with tested childr were taken into account, and even in these famili not all the children could be tested).

Penrose's method for estimating fitness seems be correct only when the gene frequencies have be obtained from data collected with complete ascerta

Table 1. 1951 AND 1952 DATA: COMPLETED FAMILIES ONLY

| Type of mating | No. of families | No. of children | Mean No. of children per family, and standard error | Theoretical fertility |
|---|---|---|---|---|
| $mm \times mm$ | 1,886 | 9,217 | 4·89 ± 0·188 | $2f'$ |
| $Mm \times mm$ | 793 | 3,978 | 5·02 ± 0·217 | $f' + g'$ |
| $Mm \times Mm$ | 79 | 394 | 4·99 ± 0·749 | $2g'$ |

nt. Such conditions are very difficult to satisfy the case of human data. But perhaps the data ven in Table 1 of the previous communication[1] may used to give some further information. (This ble covers data collected in 1952 as well as 1951; e heading to the table should be corrected accordgly.) The table is reproduced here in an expanded rm.

The distribution of genotypes among the children not given here, because it was determined for the 51 sample only. Also, as stated in the previous mmunication, this table refers to completed families ly, that is, those in which the mother was more an forty years old, and therefore presumably would t have any more children. This limitation was cessary in order to avoid having different average mbers of children per family according to the fferent ages of the parents. Furthermore, this table cludes practically all the completed families in the stricts studied. (The standard errors were calculated om the observed distributions of family size.)

In this population, *M* genes are constantly being st through the death of *MM* individuals from ooley's disease; so, if equilibrium is to be mainined, the *Mm* individuals must have some kind of lective advantage over the *mm* (assuming that the utation-rate is inappreciable). Taking the frequency f the *M* gene to be about 0·09, corresponding to the opulation under consideration, Penrose's theory[2] ows that the fitness of *Mm* must be about 1·11 mes that of *mm*. This assumes additive fitness ncluding additive fertility, as shown in the last olumn of Table 1); if the fitness is assumed to be ultiplicative, almost identical values are obtained. This advantage may result either from a greater rtility of *Mm* individuals, or from a greater survivalate between conception and reproduction, or to a ombination of these factors.

An estimate of the fertilities $f'$, $g'$ of *mm*, *Mm* dividuals, respectively, may be obtained by applying ast squares to Table 1, that is, by minimizing

$$= \frac{(2f' - 4{\cdot}89)^2}{0{\cdot}188^2} + \frac{(f' + g' - 5{\cdot}02)^2}{0{\cdot}217^2} + \frac{(2g' - 4{\cdot}99)^2}{0{\cdot}749^2}$$

which gives the estimates $f' = 2{\cdot}45 \pm 0{\cdot}068$, $g' = {\cdot}55 \pm 0{\cdot}193$, covariance of $f'$ and $g' = -0{\cdot}00342$. Other methods of estimation lead to substantially he same conclusions[2].

The difference between $f'$ and $g'$ is accordingly $-0{\cdot}10 \pm 0{\cdot}22$. Although the deviation is in the direction required for producing stability, it is insufficient in quantity and not statistically significant. Thus the data are compatible either with the assumpion that there is no difference of fertility (true value of $f' - g' = 0$), or with a ratio $g'/f' = 1{\cdot}11$ (true value of $g' = 1{\cdot}11$, $f' = 2{\cdot}72$, $f' - g' = -0{\cdot}27$). On the first hypothesis, it would be necessary to suppose that the gene frequency of *M* is increased by a greater survival-rate between birth and reproduction, or at least that there was such a greater survival value until recently (for example, possibly acting as a protection against malaria). For data on survival, see Montalenti[3]: a difference of this kind has been established for the sickle-cell condition by Allison[4]. On the second hypothesis, the difference in fertility alone would be sufficient to maintain equilibrium. With an explanation of this kind it would have to be supposed that the fertility ratio would differ from district to district to agree with fluctuations in gene frequency. But it is clear that the evidence so far gathered is indecisive.

## "Air Pollution"

I SHOULD like to direct attention to a statement made in the leading article entitled "Air Pollution" in *Nature* of March 5 dealing with cement kilns which might be misleading.

Reference to Clauses 43–47 of the Beaver Report will show that the matter of dust emission from cement works is already subject to the Alkali, etc., Works Regulation Act, 1906, and the Alkali, etc., Works Order, 1935, which deal with scheduled processes. In 1935, cement works were specifically scheduled under this Act, which obliges the owner of any scheduled process to use the best practicable means to remove or reduce nuisance. The Act requires the processes to be operated to the satisfaction of the Chief Alkali Inspector, and various penalties are imposed for non-compliance.

It may be noted that power stations and similar coal-burning installations do not come under this Act, and the recommendation of the Committee is to bring such installations under control to a greater extent than indicated in Clause 40.

EDWARD BURKE
(Director of Research)

Associated Portland Cement Manufacturers, Ltd.,
Research Laboratories,
Stone, Greenhithe, Kent.
March 15.

---

IT is correct that the Beaver Report referred to the statements as set out in Mr. Burke's letter, and the Report urged an acceleration of effort in the directions desired. It is our view that the comment in the Report was not strong enough.

A parallel case arose in which reference was made in the Report to the pollution emerging from motor-car exhausts. In that case it was pointed out that legislative provision had been made; but that no effective action was taken towards abating the resulting nuisance.

We have in mind a very beautiful part of the country in which the amenities of the countryside continue to be reduced by emission from cement works. A law may exist whereby provision is made for action; but unless the law is observed it becomes ineffective. Only by sufficiently strong protest can the nuisance in question be abated.

EDITORS

# FORTHCOMING EVENTS

*(Meeting marked with an asterisk * is open to the public)*

### Monday, July 11—Tuesday, July 12

Society for Analytical Chemistry (joint meeting of the Biological and Physical Methods Groups and the Scottish Section, with the Edinburgh and East of Scotland Sections of the Royal Institute of Chemistry, the Society of Chemical Industry and the Chemical Society, in the Department of Biochemistry, University New Buildings, Teviot Place, Edinburgh 8)—Meeting on "The Use of Radioactive Materials in Biological Assay".

### Monday, July 11—Saturday, July 16

Society of Chemical Industry (at Birmingham)—Seventy-fourth Annual Meeting.

### Wednesday, July 13—Friday, July 15

Chemical Society (at the University College of the South West of England, Prince of Wales Road, Exeter)—Symposium on "Recent Work on Naturally Occurring Nitrogen Heterocyclic Compounds".

### Thursday, July 14

National Institute of Agricultural Botany (at Huntingdon Road, Cambridge), at 2.15 p.m.—Annual General Meeting.

### Friday, July 15

Biochemical Society (in the Department of Agricultural Chemistry, University College of North Wales, Bangor), at 11 a.m.—Scientific Papers.

Bone and Tooth Society (at the Royal Society of Medicine, 1 Wimpole Street, London, W.1), at 3 p.m.—Discussion on some of the Proceedings of the Ciba Foundation's Symposium on "Bone Structure and Metabolism".*

### Friday, July 15—Saturday, July 16

British Association for the Advancement of Science, Division for Social and International Relations of Science (in the Washington Singer Hall, University College of the South-West, Exeter)—Conference on "Land Use".

# APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Lecturer in Inorganic and Physical Chemistry—The Registrar, Trinity College, Dublin (July 20).

Lecturer or Assistant Lecturer in Agriculture with special reference to Grassland Husbandry—The Registrar, Wye College, Wye, Ashford, Kent (July 20).

Senior Assistant in Research in the Department of Geodesy and Geophysics—The Secretary, Appointments Committee of the Faculty of Geography and Geology, Department of Geography, Cambridge (July 21).

Chemist, Senior Scientific Officer grade (with a first- or second-class honours degree or equivalent in chemistry, postgraduate research experience in physical chemistry, preferably on the properties of surfaces or of high polymers, and some knowledge of biological subjects), at the Ministry of Supply Experimental Establishment, near Salisbury, Wilts—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting F.458/5A (July 23).

Lecturer in Mathematics—The Secretary of University Court, The University, Glasgow (July 30).

Lecturer in Social Anthropology—The Registrar, The University, Manchester 13 (July 30).

Organic Chemist (honours graduate and preferably with experience in handling natural products, or of chromatography and enzyme work), at the Colonial Products Laboratory, London, S.W.7, for fundamental investigations into the chemistry of pyrethrum—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting F.465/5A (July 30).

Senior Lecturer in Agriculture—The Secretary, West of Scotland Agricultural College, 6 Blythswood Square, Glasgow, C.2 (July 30).

Lecturer/Senior Lecturer in Biochemistry at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Sydney, July 31).

Professor of Experimental Physics, and a Lecturer in Mathematics at the University of the Witwatersrand, Johannesburg, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, August 10).

Senior Lecturer (with a university degree in mechanical engineering, and preferably with experience in industrial or production engineering) in Mechanical Engineering, at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, August 15).

Lecturer (with special qualifications in physical chemistry) in Chemistry—The Secretary, The University, Aberdeen (August 20).

Chair of Applied Mathematics at the University of Cape Town, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (August 30).

Assistant Lecturer in Anatomy, to undertake teaching research—The Secretary, University College, Gower Street, Lond W.C.1 (August 31).

Lecturer or Senior Lecturer in General and Experiment Psychology at the University of Melbourne, Australia—The Sec tary, Association of Universities of the British Commonwealth, Gordon Square, London, W.C.1 (Australia, August 31).

Lecturer (with a degree in agriculture and preferably some perience of teaching) in Agriculture, at the Imperial College Tropical Agriculture, Trinidad—The Secretary, Imperial College Tropical Agriculture, 40 Norfolk Street, London, W.C.2 (August 31)

Chair of Botany at the University College of the West Indie The Secretary, Inter-University Council for Higher Education Ov seas, 1 Gordon Square, London, W.C.1 (September 30).

Lecturer, a Reader, and a Professor in Physics at t Chulalongkorn University, Bangkok, Thailand—Royal Thai Embas 21 Ashburn Place, London, S.W.7.

Lecturer (with a good honours degree, teaching and indust experience) in Chemistry, at Rutherford College of Technolo Newcastle-upon-Tyne—The Director of Education, Northumberla Road, Newcastle-upon-Tyne 1.

Senior Physical Chemist (with a first- or second-class hono degree in physical chemistry or biochemistry, together with consid able research experience), to lead the newly formed Technolog Irradiation Group, and carry out research and development work the field of beta and gamma irradiation—The Establishment Offic U.K. Atomic Energy Authority, Atomic Energy Research Establi ment, Harwell, Didcot, Berkshire, quoting 2/103/236.

Senior Scientific Officer (with at least a second-class hono degree, and preferably with experience in electronic circuit desig for work on the design of electronic instruments and development techniques in using such instruments in the discovery and ass of radioactive ores—The Establishment Officer, United Kingd Atomic Energy Authority, Atomic Energy Research Establishme Harwell, Didcot, Berkshire, quoting 2/103/273.

# DEVELOPMENT IN EAST AFRICA

THE report of the Royal Commission on East Africa*, appointed in January 1953, with Sir ugh Dow as chairman, to examine the measures ecessary to achieve an improved standard of living, cluding the introduction of capital to enable peasant rming to develop and expand production, is a assive document of nearly five hundred pages and nges over a distinctly wider field than its strict rms of reference cover. The Commission was indeed arged to examine, and where necessary comment pon, policy in such related fields as education and ublic health which appeared to it to bear on the roblems with which it was primarily concerned, and particular the extent to which existing technical aining facilities are adequate to meet the require- ents of extensive industrial development. It was so to consider probable trends of population in East frica and to make appropriate recommendations in lation to the other problems involved. Specifically, was instructed to frame recommendations with articular reference to six topics: the economic evelopment of the land already in occupation by e introduction of better farming methods; the daptations or modifications in traditional tribal stems of tenure necessary for the full development f the land; the opening for cultivation and settle- ent of land at present not fully used; the develop- ent and siting of industrial activities; conditions f employment in industry, commerce, mining and lantation agriculture with special reference to social onditions and the growth of large urban populations; nd the social problems which arise from the growth f permanent urban and industrial populations.

Even without the broad interpretation of its terms f reference—including some study of the historical ackground, of the results of past legislative and dministrative measures, and an attempt to under- and how East Africa's modern environment has risen—which the Commission has wisely chosen to dopt, the report deals largely with details which lie utside the field of science and even of technology, hough they are of indirect interest to both scientist nd technologist and may determine the success or ilure of his work in Africa. Nevertheless, in its nsidered unprejudiced approach, even more than its comprehensive grasp and constructive un- hibited suggestions, the report is characterized sentially by the scientific spirit. Its whole approach nd treatment of the problems are in keeping with e late General Smuts's plea for the cool, serious, entle spirit of science in world affairs in his Sidgwick emorial Lecture at Cambridge more than a quarter f a century ago, though in that interval neither the ientific expert nor the scientific spirit has won the lace and influence which Smuts considered necessary a truly democratic order.

For that reason alone although, apart from some oints in the chapters on manufacturing industries nd on African labour, particularly relating to technical education, the chapters on health and education, water development, statistics, agricultural potential and alternatives to customary land use contain most of the material of immediate concern to the scientific worker; the main conclusions and the recommendations and suggestions collected at the end, numbering nearly five hundred, will be read with interest by all men of science concerned with African problems. Not only do they confirm important findings of the recent Binns report on education and of Dr. E. B. Worthington's survey of research and scientific services in East Africa, but they also provide background for the consideration of work being carried out by the Colonial Research Council, or with the assistance of Colonial Development and Welfare Funds or Technical Aid. They indicate how large a contribution science can make to African development and welfare, and indeed that, without such assistance and a scientific approach to many of the problems involved, these problems are unlikely to be solved.

The Commission does not over-simplify the issues or disguise its belief that many of the problems it was called upon to examine are highly complex. It agrees with Sir Philip Mitchell's description of them as "complex and recalcitrant". Nevertheless, its main message can be stated quite briefly. Throughout most of East Africa agricultural development is impeded on the physical side by inadequate or unreliable rainfall, by soil deficiencies and by the scourge of the tsetse fly; and on present knowledge there are few of the exploitable mineral resources which have contributed so largely to the greater national incomes of some other African territories. The economic development and prosperity of the local populations thus depend in the main on the capital and knowledge which are brought to bear upon the limited natural resources rather than upon the persistent bounty of Nature.

Moreover, while the capital, knowledge and enterprise mainly responsible for economic expansion in East Africa have come almost entirely from outside the territories, the majority of Africans are still ill-equipped to face the complex problems confronting a people so recently brought into intimate contact with Western civilization; and in particular they are handicapped by their traditional form of society, which has sought its security and stability in a mode of life that has had little specialization on the side of production, few opportunities for the exchange of goods and few human contacts with the outside world. Those responsible for policy in East Africa have always been alive to the importance of introducing the capital, organizing ability and technical skill which progress requires. They have also been alive to the economic weakness of the African when confronted by enterprising forces emanating from more developed regions, and as part of a policy designed to safeguard and protect the indigenous populations a land policy has been introduced which preserves the customary rights in land that the

* East Africa Royal Commission 1953–55 Report. (Cmd. 9475.) p. xiv+482+4 maps. (London: H.M.S.O., 1955.) 17s. 6d. net.

African has enjoyed; in other directions, too, endeavours have been made to insulate the African from rigorous external competition.

This policy, however, conflicts with the desire to create the new income which alone can make possible a rise in African living standards; and the combined effect of a strong resistance to change on the part of the African, modified by an increasing desire to participate in the advantages derived from the ideas and practices of the modern world, and of a strong protective urge in official policy, has been to create a network of restrictions and controls which impede the progress it is sought to attain. All communities in East Africa face an apparent choice between progress and security; but there is no real security in the institutions which now seem to offer it. What is required, the Commission finds, is to create conditions favourable to the exercise of those activities which make for progress, and to substitute for policies hindering change other policies which will facilitate those modifications of traditional African society that will enable the requirements of the modern economy to be met.

In examining the population problem, the Commission accordingly focused attention on the conditions under which the African may participate in the advantages that a modern society has to offer, concentrating on the possibility of raising income per head of population in an environment which perhaps offers more discouragements than assistance. There are no short cuts, and there is no escape from the necessity to transform the traditional methods of production and exchange if the desired result is to be achieved. The Commission never flinches from facing difficulties; if at times it may appear to be looking too far ahead, the imagination and vision of the report are unmistakable, and the real issues are laid bare. Whatever reservations may be made as to timing, the essential soundness and value of the Commission's ideas and practical suggestions are unmistakable, and they are presented with a courage and clarity that should commend them to the many scientific workers and technologists who will be called upon to play their part in implementing them.

Fundamentally, the creation of larger incomes per head of population means greater emphasis on specialized production and greater facilities for the exchange of goods and services, as well as a greater mobility of economic resources, so that new forms of production become possible. It means greater access to supplies of new capital and the acquisition of new skills and new knowledge; but the Commission points out that the essential pre-requisite for creating an effective African labour force is the stabilization of African labour and the severance of its ties with the reserves. The key to a permanent rise in the supply price of African labour is to foster an increase in the incomes of the peasants, whether they produce for their own subsistence or for the market. Moreover, while the Commission believes that African labour can be trained to a considerable level of proficiency, the low productivity of ordinary African labour is not due merely to the lack of technical skill but also to such factors as under-nourishment, poor physique, endemic disease, inadequate supe vision and a lack of interest in ordinary econom incentives.

If these conditions can be fulfilled, the fear over-population which dominates so much of t contemporary debate may well prove to be illusory, but their fulfilment will demand not only coura but also a degree of open-mindedness and the reac ness to put the general interest in front of section interests that, from the Commission's comments such diverse matters as economic developmen transport, statistics and research, has often be conspicuously absent. In particular, a re-examinati of the whole system of restriction and controls whi dominates the distributive system is called for, wi the view of discarding those administrative devic which serve only to perpetuate an obsolete co ception of self-sufficiency or to promote a section interest. Moreover, whether in the field of educatio in the supply of credit facilities or in the acquisitic of technical skill, the expenditure of resources providing such aids should be concentrated whe they are likely to be most effective; and there shoul not be undue disappointment if positive results a slow to appear.

While the Commission thinks that a stage has no been reached when a more direct contribution fro the African to the development of East Africa is bot possible and desirable, it does not believe that an appreciable amount of capital for new industri development can conveniently be raised from th African population through compulsory saving with out imposing unreasonable burdens or doing damag to African enterprise and production. No larg reservoir of investable resources for rapid industria ization or for investment in new social capital exis in East Africa, and any substantial amount of ne industrial development will depend on the productio of increased income from the land. The econom cannot afford to provide large and effective induc ments to encourage any large-scale promotion new enterprise from abroad, and public expenditu on development projects should be concentrated objects likely to yield immediate and reasonab certain results in the form of increased income, that there will be a larger surplus to devote projects which take longer to mature. It is importa that the public expenditures of the territories shoul be closely geared to their respective national income

Such considerations imply that land policy mu be directed towards the removal of those condition which prevent the available land from being effectivel utilized and equally towards the creation of co ditions which will facilitate the application of tech nical knowledge, labour and capital in proportion suitable over the long period to the generation maximum income; what may be called individu rights of land tenure must replace the existing trib controls. It is from this point of view that th Colonial development and welfare schemes for Ea Africa, including research schemes, educationa policy, and the specific scientific problems of agr culture, forestry, hydrology and the like, should b considered.

"One of the most useful roles for statistical analysis," wrote Prof. Ely Devons, in *Lloyds Bank Review* last year, "is to reveal the implications, and sequently the consistencies in policy decisions and to attempt to ensure that the main lines of policy are in harmony and not in conflict." Much in the recent report of the Royal Commission admirably illustrates that thesis, and the main argument of the chapter on statistics, with its strong plea for adequate support for the East African Statistical Department, is that some of the political and administrative problems have now become so urgent that policies formulated on the basis of inaccurate data, or on the general impressions of observers with different standards of reliability, may, at the best, be ineffective and, at the worst, dangerous, and that the regular collection and publication of statistical data are one means of reducing or avoiding these dangers. While, however, it is of the utmost importance that the exceedingly limited resources of East Africa should be employed in the most effective manner, the resources at the disposal of the East African Statistical Department, alike in finance and qualified personnel, are inadequate for the proper discharge of the duties and responsibilities assigned to it, notwithstanding that its work is efficiently conducted.

Nor is this all. These limitations are intensified by the unsatisfactory and uncertain relationship existing between the Department and the Territorial Governments. While the East African Statistical Department is the most technically qualified official agency in the field of statistics in East Africa, and additional expenditure on the Department would yield far greater benefits if devoted to the Department than if spread over three territorial departments, the Department is so restricted that initiative for any improvement in the statistical services has to come from the Territorial Governments. Of this position the Commission is severely critical, and suggests re-examination of the position by the three governments and by the High Commission. The suggestion that the three Territorial Governments should be encouraged to build up independent statistical services is firmly rejected, and the Commission insists that it is primarily the relationship between the Department and the Territorial Governments which requires clarification. It is suggested also that the East African Statistical Department should receive a grant from Colonial Development and Welfare Funds for the development of its statistical and research work, in addition to the financial support provided by the Territorial Governments, and that the funds from both sources should be provided in accordance with a scheme covering several years at a time.

This is not the only point on which the Royal Commission is critical of the Territorial Governments or of the East Africa High Commission. Elsewhere, asserting that economic policy must be based on the assessment of economic potentialities in the territories and of East Africa as a whole, it says that development must not be impeded by policies of economic self-sufficiency within the three territories. In place of the present East African Railways and Harbours Administration, tied to the political exigencies of the separate Territorial Governments, it recommends reconstitution of the Administration as an independent autonomous Railway and Harbours Corporation, the share capital of which should be owned by the three governments, but which would be empowered to determine its rates and charges and operate and develop as a financially independent concern. It suggests, further, the establishment of a Colonial Transport Development Fund to finance the construction of railways, roads and the inauguration of air services.

These recommendations are intended to divorce railway finance, management and operation from political considerations and from uneconomic territorial rivalries which undermine the viability of the system as a whole. Similarly, the Commission recommends the establishment of an East African Road Corporation, financed jointly by the East African Governments and by loans from the Colonial Transport Development Fund and managed as an autonomous body under the High Commission. Again, while in regard to the discovery and development of water supplies, lack of which throughout East Africa is the major factor in preventing the use of otherwise productive resources, the Commission is concerned chiefly to secure adequate co-ordination within each territory, it insists that the hydrological research required should be carried out under the ægis of the East African Agriculture and Forestry Research Organization.

This would involve the water department in each territory—concerning the organization and staffing of which specific recommendations are made—working in close touch with the High Commission, the body to which the East African Agriculture and Forestry Research Organization is responsible; elsewhere in the report, the Royal Commission is rather critical of some aspects of the present research organization. The major technical obstacles to agricultural development and the economic use of land are the lack of basic data and information, the absence of co-ordination in research, and finance. While the Commission found that much effort was expended on research directed towards the solution of the many problems posed by the harsh environment and towards the evolution of methods for the more economic use of available natural resources, it noted a tendency for research to be conducted in water-tight compartments, and a general lack of liaison and exchange of valuable experience. Our knowledge of East African soils is still rudimentary, correct systems of usage have still to be evolved for various types of vegetation regimes and adequate hydrographical data are an essential pre-requisite to the irrigation projects which East Africa urgently needs. Moreover, the areas of high potentiality are very unequally distributed, and in the absence of a regional approach the tempo of development will be retarded in all the territories at a time when it is imperative to accelerate the process.

While the Commission thus expects important help towards the discovery of better systems of land usage from research, it found great need for a regular sequence of experiment from research plot to pilot field-unit, to representative test-area, and then to rehabilitation and development plan, so as to determine the patterns of usage most suitable for each locality. Impressive examples are cited of opportunities for an attack with the resources of the East African Agriculture and Forestry Research Organization on problems quite beyond the limited resources of a district team. The Commission points out, however, that there is some risk that the centrifugal political force which pulls the three territories apart at present will leave the Research Organization too weak financially and too remote administratively to make its full contribution. There is no alternative basic research station, and the budgeting vote for the Organization is subject to considerable risk in the legislatures, where few appreciate the importance of basic research or the necessity of re-examining under tropical conditions knowledge obtained in temperate climes.

While recognizing this danger, the Royal Commission sees no solution in the separate financing of the Research Organization from Colonial Development and Welfare Funds, but looks to a better relation between the central research institute and the territorial departments when the legislatures and technical staffs are united in a clear view of the objectives. To assist this process, it suggests that the staff of the East African Agriculture and Forestry Research Organization should be strengthened so that it can make available for travel in the territories scientific workers free from basic research responsibilities, who can specialize in bringing the Organization's findings to particular local problems. Within each territory there should be a special liaison research officer responsible for seeing that there is a continuous progress from research to development. It is also suggested that one of the first requirements of the East African territories is a district-by-district survey which will describe in factual terms the available land, the topography, the soil, rainfall, population and means of communication of the districts; the Commission recommends the initiation, as soon as circumstances permit, of a detailed ecological survey indicating the kind of agricultural specialization, the appropriate kind of farming system and the suitability of different types of farm organization.

There are other points of scientific interest in the report which cannot be mentioned here. The foregoing will, however, illustrate sufficiently the scientific and objective approach of the Royal Commission to the problem of development and welfare in East Africa, its receptivity to new ideas and the firmness and courage with which it challenges customs, vested interests, practices and privileges which lead to wasted resources or are anti-social in their effects. It will be apparent how closely its findings bear on the effectiveness of research already being conducted in the region and on proposals for technical assistance or Colonial development and welfare. It is a challenge to promote co-operation and understanding between races as well as between Governments, between scientific workers and legislators as well as between industrialists and settlers; it is also a challenge to the goodwill required to implement the rigorous reforms advocated by the Commission.

# FOOD PRODUCTION IN SOUT AFRICA

## A Survey of the Food and Feed Resources of t Union of South Africa

By G. Van de Wall and E. D. Alvord, Jnr. (Pretori J. L. van Schaik, Ltd.) 31s. 6d.

AMONG the many difficult problems in the Uni of South Africa, one of the most important that of food production. The population is expandin in 1951 it was ten millions as against five millions 1918; with the further development of mining ar other industries, further expansion seems inevitabl By Western European standards the country sparsely populated, the density being only twent one per square mile compared with more than thr hundred in India; it has a large farming populatio nevertheless it is barely self-supporting in food. Th year-books of South Africa give considerable inform tion about crop production in the Union and th reserves, and the Food and Agriculture Organizatio of the United Nations has in its food balance shee tabulated the available quantities of human foo both home-produced and imported. The presen survey is the most complete yet published, givin not only more detail but also providing for the firs time a reasoned estimate of the output of anim food, and therefore ultimately of human food, from the veld. The period covered was from 1917–18 t 1946–47. It was apparently impracticable to brin the survey up to date; but it serves the invaluabl purpose of constituting a reliable standard wit which later surveys may be compared.

The first part of the survey, by E. D. Alvord, deal with livestock and their products. As the veld contributes some 90 per cent of the nutrients availabl to the animals, their numbers are limited by it productiveness, which in turn depends to a considerable extent on the management. During the perio investigated, the average rate of stocking on th European farms was about fifteen acres per matur beast, the range being from more than twenty o the Karroo to between six and ten in the semi-ari regions, and less where the rainfall was higher. Bu the management is faulty; considerable quantitie of digestible protein and other nutrients are not use but are destroyed in the periodic burnings. A mer increase in the density of stocking would not solv the problems because of difficulties associated wit the long dry season; better management and close linkage with arable husbandry are recommended a the way out of the difficulty.

The arable land is much more productive; it constitutes only about 10 per cent of the land area o the Union yet it contributes more to the nationa food supply than the 90 per cent of veld. But mor could be achieved: the yields are lower than i other countries and the author courageously attribute much of this to inefficiency on the part of the farmers Sugar-cane is the one exception: it is "the onl agricultural crop which is produced efficiently in South Africa at present". But it is practically confined to Natal.

The second part of the Survey is by Dr. Van d Wall and deals with the utilization of food-stuff and especially the consumption by human beings. Estimates of total production and of total quantities available for consumption show that while th total requirements of protein and of carbohydrate were covered there were overall deficiencies of som

7 per cent in supplies of calories, 40 per cent in hose of fats, and 13 per cent in those of animal rotein. The dietary of the European population, ho form about 20 per cent of the whole, is considerably better than that of the 80 per cent non-uropean, and the author feels justified in assuming hat these carry all the deficiencies, making their ietary worse than the above figures indicate.

As in the first section, the facts are fearlessly aced, and the author discusses possible improvements. The deficiency of fats and of animal protein an be met only by increasing the output of livestock roducts. It seems remarkable that a pastoral ountry like South Africa should produce insufficient neat for its rather sparse population.

The authors are to be congratulated on a very useful piece of work which will not only be invaluable o later investigators of agricultural economics but also gives clear indications to the agricultural staff as to he directions in which improvements should be made. Earlier workers, I. B. Pole Evans, P. J. du Toit, T. D. Hall, D. Meredith and others, have long emphasized the need for better management of the eld and the livestock; this survey raises the question again in such clear perspective that it can scarcely fail to receive attention.

# JUVENILE DELINQUENTS IN THEIR URBAN SETTING

## Growing Up in the City

A Study of Juvenile Delinquency in an Urban Neighbourhood. By John Barron Mays. (Social Research Series.) Pp. ix+216. (Liverpool: University Press of Liverpool, 1954.) 17*s*. 6*d*.

IT has long been known that in many cities certain unfavourable characteristics combine to produce what have been rather inelegantly termed 'delinquency-producing areas'. The author of this book, J. B. Mays, gives a warm and interesting description of one such as these, by the Liverpool docks, which he has come to know and understand through many years of work with the young people of the neighbourhood.

It is good to see a book which, as Prof. R. M. Titmuss writes in an eloquent preface, ". . . leads us to think more about boys and boyhood in a particular situation and less about delinquent boys in a social vacuum. . . . Such behaviour is for the majority of these boys not so much a manifestation of individual maladjustment but is part of the total process of adjustment to a subculture in conflict with the culture of society as a whole". In principle, such a book would be welcomed in order to redress the balance which, of late, has tended to favour clinical studies of small groups of individual, apprehended delinquents. Like myself, Mays believes the issue of detection to be irrelevant to the problem of delinquency; most of his sample of eighty boys have passed through a delinquent phase, though they were rarely caught, and they do not seem to be neurotic, psychopathic or mentally defective, in his judgment.

Yet the author has not used fully this opportunity to improve on the work of the early Chicago ecologists. The emphasis throughout is on the social setting, rather than on the 'under the roof' culture, on environmental treatment and anti-delinquency services rather than on family problems. This is not merely a question of emphasis. Given the fact that a delinquency-producing area exists, what are the influences which determine whether or not an adolescent will take part in delinquent activities? And how can we account for those youngsters who do not 'grow out of it', and who become the 'hardened criminals' of later years? Whatever the virtues of the ecological approach, it fails to give us answers, or more than hints of answers, to these questions.

As a research document, the book leaves the critical reader dissatisfied when it comes to finding a genuine contribution to the better understanding of juvenile delinquency. Altogether, the book is too wordy, presents its evidence too unsystematically and is rather too well garnished for a scientific study. On the other hand, it is obvious that the writer is a sincere and interested youth worker, who has made a point of collecting information, albeit with some naïvety. It is perhaps not unfair to say that his aims in many ways are didactic and descriptive, rather than analytic. He wants his youngsters to "come alive to the imagination", and he feels the need for a study "with more sympathy and greater psychological depth, to place upon the bare bones of statistics the flesh and blood and spirit of recognizable humanity". This is an aim which will commend the author to many who have responsibility for the care of young people; it makes the study readable and interesting, but, where it might have 'proved' something, it can do no more than illustrate from a number of abstracted case-histories or offer a certain amount of discussion.

Perhaps, in the final analysis, the book should be read not so much as a research into juvenile delinquency, but rather as one of the relatively small number of British community studies, and as a piece of living social history. As such, it makes a valuable contribution.

# THE STAR CARR 'TREASURE'

## Excavations at Star Carr, an Early Mesolithic Site at Seamer, near Scarborough, Yorkshire

By Prof. J. G. D. Clark. With chapters by D. Walker, Dr. H. Godwin, F. C. Fraser and J. E. King. Appendix by John W. Moore. Pp. xxiii+200+24 plates. (Cambridge: At the University Press, 1954.) 63*s*. net.

THE word 'treasure' is usually confined to articles of intrinsic value; but the Mesolithic artefacts of antler and bone excavated by Prof. Grahame Clark at Star Carr, near Scarborough in Yorkshire, fully deserve this title. Their intrinsic value is nil, but the additions they make to knowledge and the speculations they arouse as to origin and relationship make them an archæological treasure to be ranked with the wonders of Sutton Hoo. During the past twenty years the Fenland Research Committee has been fostering a close co-operation between archæologists and natural historians in East Anglia. This collaboration was transferred with great success to the site discovered by Mr. John Moore at Star Carr. For three seasons the Cambridge Department of Archæology and Anthropology carried out the excavation, the Cambridge Sub-Department of Quaternary Research studied the geological, botanical and chronological implications of the site, and the Department of Zoology in the British Museum (Natural

History) preserved and studied the animal material found.

Hitherto, scholars have spoken of Baltic Forest Cultures of Mesolithic age, and have admired the wealth of barbed bone points and flint core-axes and microliths found on Danish Maglemosean sites dated to the Boreal period. The very limited quantity of similar material found in Britain, and the barbed point dredged up from the Dogger Bank, led to the assumption that there had been a diffusion of Baltic influence westward across the former dry bed of the North Sea. In this book Prof. Clark and his colleagues show us the Yorkshire countryside of Late Glacial and early Post Glacial times, and set in this environment we see a small Maglemosean lakeside settlement dated to 7500 B.C., which yielded more than twelve hundred flint implements, almost two hundred barbed points, and many other interesting artefacts. The settlement is clearly earlier than its Danish counterparts and cannot be derived from them.

The most exciting discoveries were the antler head-dresses. Skulls of male red deer, sufficiently mature to carry well-formed antlers, but still young enough not to be burdened by excessive antler weight, were selected. The skull was cut away, leaving the antlers attached to a base-plate which was thinned down and pierced by two holes. The antlers were lightened by thinning and hollowing, but the natural profile was retained. Antlers so elaborately prepared must have been worn as a head-dress, either in hunting or in ceremonial.

Summing up, Prof. Clark skilfully silhouettes the Maglemosean (*s.l.*) cultures of north-west Europe against the rapidly changing environment of the Late Glacial and early Post Glacial periods. We first see a group of Palæolithic people with Aurignacian and Magdalenian traits who utilized the burin to cut splinters out of antlers; the splinters were worked up into implements. On the Late Glacial park-tundras the reindeer was abundant, and the Hamburgian folk utilized reindeer antler only. In the birch woods of the Pre-Boreal period, red deer and elk were common, and at Star Carr the antlers of these animals were the principal raw material, though the bones of the elk and the urus were sparingly used. In the high forest of the Boreal period red deer was still common, and on the Danish sites the bones, rather than the antlers, of this animal were chiefly used.

Such important material demanded adequate publication, and Prof. Clark and the Cambridge University Press have produced a more than adequate book. There is a schedule which describes all the antler points; twenty-five are illustrated in half-tone, and line-drawings (showing three aspects) are given of one hundred and twenty. The scheduling of the one hundred and four antlers from which splinters had been cut seems scarcely justified. When so much illustration was available, it is to be regretted that the "curious spoon-like object" made from elk antler, which is only poorly shown in a preliminary publication, was not illustrated more clearly. The reduction of the illustrations is as consistent as the exigencies of size allowed, and has obviously been carefully thought out. The same cannot be said of the scales of linear measurement used. Inches, fractions of an inch, decimals of an inch, centimetres and millimetres follow one another almost on successive pages. Treatment of percentages is also uneven. When seventeen thousand flints are divided into three groups, the percentage value of the groups can certainly be carried to the first place of decimals but when thirteen barbed points are similarly divided little is gained by expressing the relationship of the groups by percentage values. When space has not been at a premium in the main body of the book it seems ungracious to use a smaller face of type in the short appendix contributed by Mr. Moore. It is unfortunate that the only error also occurs here, Fig. 80 does not correspond with its caption.

The comments of the preceding paragraph do not take away from the high value to be placed on this book, which will for years to come be studied by all interested in the events of the early Post Glacial period in Europe.

G. F. MITCHELL

# COMMONWEALTH UNIVERSITIES YEARBOOK

### Yearbook of the Universities of the Commonwealth

Thirty-second issue. Pp. lviii+2026. (London: Association of Universities of the British Commonwealth, 1955.) 63*s*.

THIS, the thirty-second edition of the "Commonwealth Universities Yearbook", follows very closely the pattern of that published last year, but there are a number of changes, some of which are the result of recent academic developments. Thus, entries are included for the first time for two new university institutions—University College of Rhodesia and Nyasaland, Salisbury, Southern Rhodesia, and the University of Rajshahi, East Pakistan; and for two Canadian institutions which have recently been admitted to the National Conference of Canadian Universities—St. Mary's University, Halifax, Nova Scotia, and Assumption College, Windsor, Ontario. Also, for the first time, an introduction has been added to the New Zealand section, and this gives a general account of university institutions in that country, written by the Registrar of the University of New Zealand. The first appendix, on qualifications for admission to first-degree courses in universities in the United Kingdom, Canada, Australia and South Africa, has been increased to include details of faculty and departmental requirements in United Kingdom universities. The third appendix, on postgraduate awards tenable overseas by United Kingdom graduates, has been rearranged under subject headings for convenience of reference.

These are the major alterations; but, of course, there are a multitude of small changes throughout the work. Generally, it can be said that these latter are additions, for nearly all the universities of the Commonwealth are expanding, some rapidly, and year by year there is a demand for information on fresh topics. Thus the present edition is about a hundred pages longer than the previous one (an increase of about 5 per cent); but the Association is to be commended for keeping the price the same.

There are 111 university institutions in the British Commonwealth which have been granted degree-giving rights in their respective countries, 22 of which are in the United Kingdom. Together they contribute a very considerable fraction of the world's higher learning, and it is obviously a great convenience to have the principal details about them published in a single reference volume. This work amply fulfils such a need.

# UROPEAN ORGANIZATION FOR NUCLEAR RESEARCH AT GENEVA

## FOUNDATION-STONE CEREMONY

ANOTHER milestone was reached in the history of the European Organization for Nuclear Research, when on June 10 the foundation-stone as laid of the laboratories at the Meyrin headquarters of the Organization near Geneva, followed y the signature of an important Agreement between he Organization and the Swiss Government. The tone-laying ceremony was conducted jointly by M. Max Petitpierre, president of the Swiss Confederation, M. François Perréard, president of the State Council of the Republic and Canton of Geneva, and Sir Ben Lockspeiser, president of the Council of the Organization. The ceremonies were attended by a arge number of eminent scientific workers and iplomatic and other representatives of the twelve member States, and by other guests.

The Agreement with the Swiss Government, which was generously given the site on which the labortories are being built, will give the Organization numerous important privileges and amenities which will greatly facilitate its work. Those who have been closely associated with the years of planning came away feeling that this unique Organization has good eason to be proud of what has been achieved so far. The high level of scientific and technical competence of the research and design teams and the spirit of enthusiasm which animates all concerned provide solid grounds for confidence in the healthy growth of the new Organization.

Since last September, when the 1953 Convention setting up the Organization came into force, full advantage has been taken of the preparations of the previous years, and work has been proceeding at an ever-increasing speed, of which there is now impressive evidence at the Meyrin site. Good progress has been made with the massive foundations and the housing for the smaller of the two accelerators, the synchro-cyclotron. Its magnet and coils are being made, and it is hoped to have the machine working early in 1957. The larger accelerator, the proton-synchrotron, still presents formidable scientific and technical problems, and work is naturally less advanced. Even here, however, impressive progress has been made, and on the site itself excavation has begun on the vast circular space required to accommodate the magnet.

In his speech at the stone-laying, M. Petitpierre said that, since the time when the project was first mooted, a considerable distance had been covered and most of the eminent scientists of the day had co-operated to achieve this. It was an important occasion, for he thought it was the first time in history that a community of nations had undertaken the construction of an international scientific laboratory. There will be no secrecy whatever about the work done there, the single purpose of which is to extend the field of knowledge. The machines will place at the disposal of scientific workers very powerful instruments to open up hitherto unknown horizons. This is particularly important at the present time when the vast possibilities for the use of nuclear energy for peaceful purposes are beginning to be realized. Thanks to the initiative taken within the framework of the United Nations Organization and thanks also to the work of the European Organization for Nuclear Research, atomic energy has begun to assume a peaceful significance instead of being thought of in terms of weapons of destruction. It is the belief of the Swiss Confederation, continued M. Petitpierre, that, particularly in the field of nuclear energy where the discoveries made hitherto represent but a beginning, it is only by mutual co-operation and with the added feeling of dependence upon one another and their common destiny that nations can employ this source of energy as an instrument of progress. It is the sincere hope of the Swiss Federal Council, he concluded, that the foundation-stone ceremony will mark not only the beginning of collective scientific investigation but also that it will stand as a memorial to pacific collaboration among nations.

In expressing the pleasure of the Geneva authorities, whom he represented, M. Perréard referred to the initial diffidence of some sections of the Geneva community about the decision of the authorities to set up the Organization on Swiss territory. When the matter was put frankly before the people of Geneva, the authorities and the population were unanimously agreed to it being set up in their midst. The creation of the Organization has inevitably provided various legal problems arising from the need to harmonize the existence of national and international bodies on the same territory. The Swiss experience of various international organizations having their headquarters in Geneva has, however, enabled these problems to be settled without great difficulty, and any others which might arise will certainly be settled in the same friendly spirit. In conclusion, M. Perréard reiterated the welcome given to the Organization by Geneva with the deepest satisfaction, for thereby Geneva herself would be scientifically and intellectually the richer. He expressed the hope that the foundation stone, set in a country miraculously spared the horrors of war over so long a period, would symbolize in the field of science the spirit of mutual aid which should unite all men of goodwill to whatever country they might belong.

Sir Ben Lockspeiser, in thanking M. Petitpierre and M. Perréard, agreed that those present were participating in what was a unique occasion in the history of science. Scientific research has never been confined to any one country, and scientific thought is international in scope and character. Sir Ben stressed that the aim is both to strengthen existing national institutions for learning and research and to build up a focus of study and experiment where groups of scientific workers can together achieve what they would be unlikely, or unable, to do in isolation. It is entirely fitting, he said, that the Organization's laboratory should be established in Geneva, which has particularly the traditional atmosphere of freedom required by scientific research.

Dr. Luther Evans, director-general of the United Nations Educational, Scientific and Cultural Organization, added a personal word of congratulations on the successful progress of the European Organization for Nuclear Research, which had been established with a substantial amount of help from Unesco but which is now in a position to stand on its own feet as an independent body. Unesco, he said, is proud of the new Organization and will continue to maintain close contact with it.

# JUBILEE OF THE UNIVERSITY OF SHEFFIELD

By Dr. D. H. PEACOCK

On June 3, 1905, Mr. (later Sir) George Franklin, chairman of the Council of University College, Sheffield, brought to Sheffield the Royal Charter constituting the University. He was met at the Victoria Station by the officers of the new University and some thirty carriages filled with students and decorated in the College colours. This procession, led by the band of the Hallamshire Rifles, moved off to the old University College building, where an enthusiastic meeting was held to receive the Charter.

The College which was raised then to the status of an independent University had been formed in 1897 by the union of three institutions: Firth College, the Sheffield Technical School and the Sheffield School of Medicine.

Firth College enrolled its first students in 1880 for courses in mathematics, classics, ancient history, modern history, chemistry, physics, mechanics and the theory of music. This forerunner of the University had been founded at his own charge by Mark Firth, head of the firm of Thomas Firth and Sons and lately mayor of Sheffield, whose enthusiasm had been stimulated by the extension lectures conducted in Sheffield in the preceding few years. The eventual provision of technological courses had been envisaged from the beginning, and in 1886, largely as the result of the activity of Sir Frederick Mappin, then representative of Sheffield Corporation on the College Council, the Sheffield Technical School was opened as a branch of the College, though under separate management, and in separate buildings which have ever since remained the centre around which the University's technological departments have grown.

The Medical School had been opened by members of the profession in 1828. For a few years there were indeed two rival medical schools; but one disappeared after its buildings had been sacked by a mob. The early history of the survivor was chequered, and once at least a decision was taken to close it. Its survival was due to the devotion and self-sacrifice of a group of medical practitioners in the town, who, with the help of public subscriptions, raised the money to erect a new building, opened in 1888 opposite Firth College. Thereafter there was a close association between the two institutions, and in 1891 Firth College took over all the teaching of the preliminary sciences. When a charter for a University College was granted in 1897 the Medical School joined Firth College and the Sheffield Technical School to become the new University College's faculty of medicine.

University College, Sheffield, was constituted with the view of admission to the federal Victoria University, but in 1897 that University was already suffering from internal strain. The Sheffield College applied for admission and was refused. Soon after, the Victoria University split up, and in these circumstances Sheffield decided to apply for a university charter—a project which had never been far from the minds of the Trustees of Firth College. New buildings, designed for an extended University College, had just been completed when the charter was granted, and were opened on July 12, 1905, by King Edward VII. Around these buildings in Western Bank (about a quarter of a mile from the applied science buildings in St. George's Square) the subsequent expansion the faculties of arts, law, pure science and medicin has taken place.

The University of 1905 owed much to the schola ship, zeal and organizing ability of the staff University College and its predecessors. They ha remained undaunted by the difficulties and delay attendant upon inadequate financial resources, an had pressed forward determinedly towards standard then not commonly accepted. In some cases th influence of what was accomplished extended wel beyond Sheffield. In particular, W. M. Hicks, pro fessor of physics (1883–1917), principal of Firth College and later of University College, and charte vice-chancellor of the University, had played a important part as the initiator, with Sir William Ramsay (then principal of University College, Bristol) of the campaign for government grants for the English university colleges, the successful outcome of which had saved some of the colleges—Firth College almost certainly—from extinction. In the arrangements made for the administration of these early—and tiny—grants may be traced the outline of the future University Grants Committee and the beginning of a movement which is transforming the civic universities into national institutions.

In the early days, of course, only a very small proportion of students were university students as we know them now. The session 1905–6 began, in fact, with 585 day students of whom only 114 were reading for degrees and diplomas. The teaching staff of the faculties of arts and science also catered for a large proportion of the 250 occasional students, some 200 evening students, and students of the Sheffield Teachers' Training College who came to the University for courses which the Local Education Authority could not then provide. One of the earliest steps taken, under the energetic leadership of J. A. Green (appointed professor of education in 1906), was the establishment of a University Training Department for Teachers, in which, by 1910–11, there were a hundred students. Degree courses in law were made available with the creation of a separate faculty in 1908. In the same year, with R. N. Rudmose Brown (professor of geography, 1931–45) as lecturer, geography was introduced into the curriculum for ordinary degrees in the faculty of pure science. Degree and diploma courses in architecture were instituted in 1913 (though it is only recently that the department has grown into one of the largest in the faculty of arts). Music, though taught since the days of Firth College (during 1890–1920 under the well-known chorus master, Sir Henry Coward), did not become a subject for degrees until 1928, when, the nucleus of a department having been built up under the influence of Sir Henry Hadow (vice-chancellor, 1919–30), F. H. Shera was appointed to a full-time chair.

On the technological side the young University was in a strong position. The equipment and facilities of the applied science buildings were among the best then available. Associateships in engineering and metallurgy, already established by Prof. W. Ripper (professor of engineering, 1889–1923; principal of the Sheffield Technical School, 1889–97; vice-chancellor of the University, 1917–19) and Prof. J. O. Arnold (professor of metallurgy, 1889–1919), were of a high standard, and were held (and have remained to this day, although superseded by degree courses) in great esteem by local industrialists. The degree and diploma courses in engineering and metallurgy ould be completed by either full-time or part-time tudy combined with practical experience. The rly courses for the diploma in mining followed a milar pattern, as did the degree courses instituted 1913 under F. E. Armstrong (professor of mining, 913–21). Since then the necessary practical experience has been gained largely by vacation work. he Department of Glass Technology was instituted s the result of experience gained during the First Vorld War. In October 1914 the University set up Scientific Advisory Committee with W. E. S. urner (professor of glass technology, 1920–45), then cturer in physical chemistry, as its secretary. Turner oon realized the need for the application of scientific ethods to the manufacture of glass, and a full-time ourse for a diploma in glass technology was established in 1916, and a degree course in 1919. Fuel echnology, which had been unequally yoked with pplied chemistry, was made a separate chair in 920 (R. V. Wheeler, professor of fuel technology, 920–39) and degree and diploma courses instituted n 1921.

The growth of the medical faculty between 1905 nd 1945 owed much to the pioneer work of earlier eachers in the Medical School. Arthur Hall (professor of physiology, 1897–98, of pathology, 1899–906, and of medicine, 1915–31) joined the Medical chool as an assistant demonstrator in physiology n 1889 and strove successfully to establish full-time eaching departments in the subjects involving aboratory work. His work on behalf of the school was helped by Christopher Addison (Viscount Addison f Stallingborough, first Arthur Jackson professor f anatomy, 1897–1901). J. B. Leathes (professor of physiology, 1914–33) reorganized the courses, and did much to effect a revolution in the linking of laboratory work with clinical teaching not only in Sheffield but also throughout the country. The first full-time clinical chair was established in 1920 when Edward Mellanby was appointed professor of pharmacology, and with the chair was associated an appointment as physician at the Sheffield Royal Infirmary. When H. W. Florey was appointed to the chair of pathology in 1932, J. W. Edington became the first full-time professor of bacteriology, after having been for more than ten years responsible for both departments. A full-time professor of dental surgery (G. L. Roberts) was appointed in 1935 and a chair of biochemistry (H. A. Krebs) created in 1945. Since 1945, clinical chairs have been instituted in medicine, surgery, child health, obstetrics and gynaecology and social medicine.

The expansion in the range of studies offered at the University was accompanied by an increase in the number of students and a corresponding demand for increased teaching and residential accommodation. The natural expansion in buildings was, however, checked by the First World War and the subsequent depression. Extensions to the technological departments were completed in 1913; but further expansion had to wait until after 1930. Then, under the direction of A. W. Pickard-Cambridge (vice-chancellor, 1930–38) a new wing for the departments of pure science and extensions to the Departments of Mining and of Metallurgy were completed. In 1939 the Department of Glass Technology moved into its new building for which funds had been raised by the glass industry. The Second World War interrupted the building programme. During the War, under the leadership of Sir Irvine Masson (vice-chancellor, 1939–52), the University had made notable contributions to the war effort both in research and in production. As soon as the War ended, plans were drawn up to serve the increased number of students which the University was called upon to train. Extensions to the Department of Mining were opened in 1953, and a large new building to provide expanded facilities in teaching and research in the Departments of Civil, Mechanical and Electrical Engineering was opened by the Minister of Defence in April this year. Post-graduate schools in physical metallurgy were opened in 1950, in applied mechanics in 1951 and in mining in 1952. This expansion in applied science naturally requires expanded provision for teaching and research in the fundamental pure sciences. A new building for chemistry was opened in 1954, and the accommodation vacated has been altered for the use of departments in the faculties of pure science and of medicine. The necessary sites in the neighbourhood of Western Bank have been acquired for a complete University Quarter, and plans for new buildings for the library, arts, law, physics, the Medical School and administration have been drawn up.

All this expansion has provided, and is providing, domestic problems of considerable magnitude. The public spirit of Sheffield ladies was soon stirred to arrange halls of residence for women students. Soon after 1930 three of these small halls were united in one larger hall. At about the same time the first hall of residence for men was built and a Students Union provided by the generosity of J. G. Graves. Additional halls of residence for men were opened in 1947 and in 1952. A full-time warden of lodgings was appointed in 1947, and the student health service set up in 1948 now has three full-time medical officers. Extensions to the halls of residence are planned, as are new buildings for the Students Union, refectories and a staff house. A new playing field near the University has been opened, and the site for another acquired. The material resources planned are impressive; their use will depend on character and ideals.

Universities exist to extend knowledge, to conserve knowledge and to hand on knowledge. Sheffield can claim that it has performed all these functions in the past and can, with some degree of confidence, hope to continue to perform them in the future.

---

# COLOUR SPECIFICATION

## POSSIBLE REVISION OF THE C.I.E. SYSTEM

ALTHOUGH the principles of colour-matching with mixtures of three coloured lights were worked out in the latter half of the nineteenth century —notably by Helmholtz, Maxwell, Konig and Abney —it was not until 1931 that an agreed system of colour specification based on these principles was adopted. The essential preliminary was an adequate knowledge of the colour-matching properties of the average colour-normal eye. During 1927–30 excellent investigations of colour-matching by Guild and Wright respectively, using different groups of subjects, gave closely concordant results for a vital part of the information required, namely, the quantities, two positive and one negative, of the three component lights in a mixture to match an unspecified amount of each of the spectral colours. (The negative sign means that in the match the component light has to be mixed with the spectral stimulus.) The Commission Internationale de l'Éclairage had earlier adopted a standard visibility function $V_\lambda$ defining the reciprocal intensities in energy units of spectral stimuli having the same brightness or luminosity for the average eye. A combination of the mean Guild–Wright data with the standard visibility function $V_\lambda$ enabled the Commission to adopt, in 1931, a complete quantitative basis for colour specification, that is to say, a tabulation of the colour-matching functions or quantities of three component lights in a mixture to match unit energy intensity of each of the spectral colours. The component lights for which the Commission agreed the basic data were three spectral stimuli (700·0, 546·1 and 435·8 mμ), but for colour specification it was decided that the data should be transformed to a different set of mixture components, the so-called C.I.E. reference stimuli. The C.I.E. reference stimuli coincide with no actual physical stimuli—their relation to such stimuli is something akin to that between a virtual and a real image in geometrical optics—but this unreality is more than compensated for by the practical advantage of leading to positive colour co-ordinates for all real colours. The C.I.E. system is to-day the one fundamental system of colour specification in all branches of colour technology.

In reviewing the recent discussion by the Physical Society's Colour Group on April 27, it is first of all necessary to emphasize that no grave errors or shortcomings of the existing system have been brought to light, and those who have accepted and used it need not fear that their confidence has been misplaced. But there have been questionings which touch the underlying principles, the experimental data and the choice of reference stimuli. Work by Blottiau (1947) and Trezona (1953–54) suggests that the additive law of colour-matching, as applied to the measurements of a particular subject, is only approximately true. Again, while an indirect determination of the colour-matching functions by way of a $V_\lambda$ function may give correct results, it would appear preferable to use a direct method not involving heterochromatic photometry. As it turns out, doubts about the $V_\lambda$ data incorporated in the C.I.E. system initiated the move towards a revision. There is evidence that at short wave-lengths the values are too low. Considerable attention has been given to the additivity of brightness in heterochromatic photometry. This issue—quite distinct from the additive law in full colour-matching already referred to—would have no bearing on colour specification by the trichromatic method but for the fact that $V_\lambda$ data were used in setting up the present C.I.E. system.

It may be said that any significant defect in the basic data of the C.I.E. system would have shown itself in use before now. Only one serious claim has been made that in a technological application the C.I.E. system gives demonstrably incorrect predictions about colour matches. This fact must not be rated too high. Opportunities for clear-cut tests are not common and, because of the considerable individual differences in colour-matching, any discrepancy between the results of an actual observer and the computed result for the C.I.E. standard observer is likely to be laid at the door of the former. In one group of applications it would appear that the C.I.E. data cannot be giving quite the correct answers. This is when colour-matching of patches subtending considerably more than 2° at the eye are concerned. The standard data refer specifically to a 2° field, and it is known that field-size is a significan factor. Obviously, if only one set of colour-matchin functions is to be standardized, it cannot be completely satisfactory for all practical field-sizes. Bu the best choice of field-size or the best compromi is not easy to determine.

The changes proposed in the C.I.E. referenc stimuli have been mainly directed towards inco porating in the C.I.E. system additional informatio about colour perception. Every colour is chara terized by three numbers—the unit co-ordinates $x$, $y$, of sum unity—and it is customary to represent th colour by a point in a rectangular ($x$, $y$) plot. Exper ments on colour discrimination show that in th C.I.E. ($x$, $y$) diagram the distance apart of two point corresponding to stimuli equally bright but ju perceptibly different in colour varies very widely i different colour regions. No transformation to ne reference stimuli would give a perfect 'unifor chromaticity' diagram, but a considerable improve ment over the C.I.E. diagram is possible. Othe properties of colour perception emerge when we ar concerned with the colour relations of pigmente surfaces viewed, under a suitable illumination, on 'white' background. The representation of thes properties is simpler with some choices of referenc stimuli than with others. At the Physical Society' Colour Group meeting, Dr. R. W. G. Hunt urged th merits of a uniform chromaticity diagram due t MacAdam, while Mr. R. G. Horner favoured a mor radical change in the method of plotting colou co-ordinates, adapted to represent surface colours.

The new experimental material which the Com mission will have considered in discussing revisio of its system in June includes studies of the V function in the blue end of the spectrum mad respectively at the National Bureau of Standards Washington, D.C., by Ishak and Teele, and at th National Physical Laboratory, Teddington, by Burc and Stiles, and a direct determination (that is, no involving the $V_\lambda$ function) of the colour-matching functions for 2° and 10° matching fields with spectra stimuli as the mixture lights. For the latter work, also being carried out at Teddington, the results fo an initial group of ten subjects are now available. The new results for the 2° field show certain interesting, if minor, deviations from the present C.I.E. values, deviations which are not attributable to the use of an inappropriate $V_\lambda$ function in the derivation of the C.I.E. system nor to differences of average eye pigmentation of the various groups of subjects concerned. These are additional to some deviations in the blue end of the spectrum which could spring from the factors mentioned. A difference in the conditions of the new work at the National Physical Laboratory as compared with that of Guild and Wright is the use of a 'blue' mixture light of shorter effective wave-length—about 445 mμ instead of 460 mμ. This should be immaterial, if the additive law for complete colour-matching is strictly true. A direct test of the effect on the unit co-ordinates of changing the 'blue' mixture stimulus from 460 to 445 mμ had already been made for his own eye by Prof. W. D. Wright using his own spectral primary colorimeter, and the results, described at the Colour Group meeting, confirm the implication that the colour-matching functions may not be completely independent of the mixture colours used in their determination*. The results of similar comparisons being made at the National Physical Laboratory will be available shortly. The whole question of individual obedience to the additive law of colour-matching s of the first importance in visual theory. The bearing on colour specification in the C.I.E. system s of a different kind, and the practical outcome is perhaps less disturbing than might at first appear. f, as seems probable, additivity ambiguities are of no higher order of magnitude than individual differnces in colour-matching properties and differences arising from the wide range of practical conditions of colour observation, the extra load on a 'standard observer', who must represent a compromise over all these variations, may not be great. But the problem of the best compromise is changed, and until we have a clearer picture of the additivity difficulties we would be ill-advised to alter the present system. This is so, even though on some points—such as the values of the colour-matching functions in the extreme blue, which are shown by all the new work to be too low in the C.I.E. system—some improvement would be possible now. For colour technology, a change in the C.I.E. system means an upheaval—computations of new tables, adjustments of all kinds of colour specifications, modification of physical colorimeters, etc.—and it would be unthinkable to make an interim change now with the possibility of a further change a year or two later.

* *Note added in proof*. Prof. Wright has made additional measurements which avoid an uncertain interpolation previously involved. He now finds virtually no difference between the unit co-ordinates of the spectral colours obtained by the use of 'blue' primaries 445 and 460 mμ, respectively. The National Physical Laboratory comparisons, since available, also show only slight differences in the unit co-ordinates, although there appears to be a small change in the 'blue' colour-matching function.

W. S. Stiles

# OBITUARIES

## Dr. R. N. Salaman, F.R.S.

In Redcliffe Nathan Salaman, whose death occurred on June 12, aged eighty, the world has lost one of the grand old men of science. He was one of the very few remaining representatives of a world of learning that had not known the spectre of modern specialization, a world where the boundaries between one science and another were scarcely recognized and even those between science and the humanities were comfortably bridged. Dr. Salaman's whole life and work illustrated this.

Born in September 1874, he attended St. Paul's School and became a scholar of Trinity Hall, Cambridge, where, though he was for some unaccountable reason never a Fellow, he was a familiar figure in the combination room for many long years. He began his scientific career in medicine, at the London Hospital, and in 1901 was made director of the Pathology Institute there. But this was the time when the spectacular rediscovery of the Mendelian laws of heredity had given birth to the new science of genetics; Salaman was one of the first in Great Britain to become interested in Mendelism and soon joined William Bateson's original group of British geneticists.

It was characteristic of him that his interest in the Mendelian laws embraced both their direct implication in relation to studies of the origin and relationships of racial groups in man and their indirect use in the improvement of one of man's chief food crops, the potato. In both these fields he published some of the first scientific studies; he was made director of the Potato Virus Research Station at Cambridge on its foundation, and in his work there was the first to make use of a wild relative of the domestic potato, since recognized as the Mexican species *Solanum demissum* or a derivative, in order to introduce resistance to potato blight, *Phytophthora infestans*, into cultivated potatoes. To this day *S. demissum* remains one of the main sources of resistant genes.

Salaman it was who in 1930 recognized the dawn of a new epoch in potato breeding with the Russian discovery of a whole polyploid series of relatives of the potato—some wild, some cultivated—growing in the Andes in South America; he took an active interest in the expedition sent by the British Commonwealth to collect these potatoes and in the foundation of the Commonwealth Potato Collection and the Potato Research Station at Cambridge which resulted from the expedition. Characteristically again, Salaman's imagination was fired by these potatoes just as much for their anthropological as for their genetical and agricultural significance; indeed, his book on the subject, entitled the "History and Social Influence of the Potato", is cited as much by historians and anthropologists as it is by geneticists or plant breeders; for these latter Salaman's researches have thrown light on the origin of the cultivated potato, its early introduction into Europe and its relationship to other, more primitive, potato species. For all readers it serves as an illustration of how an eminent scientist may yet be a master of English literary style—a fact also appreciated by anyone who has attended one of the many lectures that Salaman was so often called upon to deliver.

In 1935 Salaman was elected to fellowship of the Royal Society. In spite of his multifarious activities in the fields of medical pathology, plant genetics, phytopathology and anthropology, he was one of those busy people who always find time for something else. Living as a country gentleman at Barley in Hertfordshire, he was surrounded by a large family, took an active part in local good works, and in the critical years of the Nazi and other persecutions made an energetic contribution to the activities of the Council for the Protection of Science and Learning. In London he was a familiar figure in the rooms of the Athenæum, and there are few men of the present day who can be said to have led a more varied and constructive life, embracing so wide a field of diverse interests and activities.

P. S. Hudson

## Prof. D. B. Blacklock, C.M.G.

The death occurred on June 10 of Donald Breadalbane Blacklock, emeritus professor of tropical hygiene in the University of Liverpool. He was born on January 7, 1879, at Oban, Argyllshire, and was educated at Fettes College and at the University of Edinburgh, where, after a distinguished career both in studies and in sport (he played cricket for the University and rugby for Edinburgh Wanderers), he graduated M.B., Ch.B. in 1902, proceeding to the degree of M.D. in 1909. In 1911 he was appointed to the Runcorn research laboratory of the Liverpool School of Tropical Medicine, where he worked, first as research assistant and later as director, until 1914, when he was appointed lecturer in parasitology to the Liverpool School.

During this early period of his career, Blacklock published a series of twenty-one papers on trypanosomiasis, most of them in his own name, but some in collaboration with Warrington Yorke. They were chiefly concerned with the morphology of trypanosomes; but in one of them the important discovery was recorded that *T. cruzi* could undergo development to the infective stage in the bed-bug.

In 1914, Blacklock and Yorke joined the School's thirty-second expedition, which was dispatched to West Africa, and, while in Sierra Leone, studied the breeding places of *Glossina palpalis* and the various species of trypanosomes transmitted by the fly to man and his domestic stock. By the time that the expedition had returned to England, war with Germany had broken out. Blacklock joined the R.A.M.C. and served with it, both at home and abroad, from 1915 until 1919, actively continuing with research during his period of service, and collaborating with Stephens, Yorke and other colleagues in a symposium of more than thirty papers on the treatment of malaria.

In 1921, when the Sir Alfred Lewis Jones Research Laboratory was opened in Freetown, Sierra Leone, by the Liverpool School, Blacklock was appointed its first director and was given the title of professor of tropical diseases of Africa by the University of Liverpool. The eight years which followed represent the most active and productive part of Blacklock's long scientific career. During that time he published more than forty papers on a wide range of problems concerned with various aspects of schistosomiasis, beriberi, malaria, trypanosomiasis and goitre, the most outstanding of which demonstrated for the first time that *Onchocerca volvulus* was transmitted t man by *Simulium damnosum*—a discovery of notabl importance in the history of tropical medicine. I 1929 Blacklock returned to Liverpool to succeed York in the Walter Myers chair of parasitology, which h held until 1934, when he was appointed the first holde of the newly established chair of tropical hygiene.

During the Second World War, Blacklock, the nearly sixty-five, was sent to Freetown on a Govern ment mission with the rank of surgeon-captain t investigate the malaria situation at the port and t submit recommendations for its control. His repor led to a concentrated attack on the vector anopheline and resulted in the elimination of malaria from th port and the protection of convoys using it. For thi and other notable services he was awarded th C.M.G. in 1942.

He retired from the chair of tropical hygiene i 1945, and in 1949 the Liverpool School of Tropic Medicine presented him with the Mary Kingsle Medal, as a fitting tribute to his work in West Afric and elsewhere.

Blacklock was a man of striking presence, hand some in appearance, gentle and reserved in manner his innate kindliness lit from time to time wit flashes of brilliant wit. His clear incisive mind mad him an excellent lecturer, and his text-book o human parasitology, written in collaboration wit Dr. Thomas Southwell and now in its fifth edition, i proof of his powers as a teacher.

He is survived by his wife, Dr. Mary Georgin Blacklock, C.B.E., who accompanied him on hi many travels and who collaborated in some of hi scientific work.

R. M. GORDON

# NEWS and VIEWS

## Applied Mathematics at Sheffield:
## Prof. D. N. de G. Allen

MR. D. N. DE G. ALLEN, reader in applied mathematics at the Imperial College of Science and Technology, London, has been appointed to the newly created chair of applied mathematics in the University of Sheffield. Mr. Allen is a graduate of the University of Oxford, and received his early training in research under the direction of Sir Richard Southwell at the University Engineering Laboratory, where he became interested in the newly developed relaxation methods as applied to engineering problems. Later, when Sir Richard became rector of Imperial College, Allen accompanied him there and played a large part in the establishment of a research team concerned with relaxation methods. He was appointed lecturer in the Mathematics Department of Imperial College in 1945, and later became reader, then taking over much of the responsibility for the teaching of mathematics to students of engineering. Under his guidance there has grown up at the Imperial College a thriving and productive group of research workers able to apply successfully relaxation techniques to a variety of mathematical problems of engineering interest. In 1949 Allen visited the Massachusetts Institute of Technology to deliver courses of lectures on subjects related to his own field of research, and later, in 1954, he paid a short visit to India for the same purpose. In addition to his interests in teaching and research, Allen has played a full part in the general and social activities at the Imperial College, and though he will be greatly missed by all his colleagues there, he takes with him their very good wishes to his new responsibilities at the University of Sheffield.

## University College of Rhodesia and Nyasaland:
## Prof. E. B. Edney

THE appointment of Dr. E. B. Edney, reader in Entomology in the Department of Zoology and Comparative Physiology, University of Birmingham, to the chair of zoology in the newly created University College of Rhodesia and Nyasaland, Salisbury, Southern Rhodesia, cannot fail to please those concerned about the future of academic biology in the British Commonwealth. Dr. Edney is an entomologist with a distinguished research record in the field of arthropod physiology and ecology, where his work on water relations and microclimatology has produced results of considerable theoretical and methodological importance. As a systematist, he has specialized in the taxonomy of two widely different arthropod groups, the Chrysididae and Isopods, and has published monographs on both. His past association with academic work in Africa at Rhodes University College, at the National Museum in Bulawayo and at Makerere College, Uganda, has recently been rounded off by a successful research expedition to the Sahara. As a senior member of the teaching staff of the Zoology Department in Birmingham, Dr.

ney has excelled by his wide knowledge and erest in all fields of the subject, including the mplex problems of primate evolution, and by his alities as a teacher of undergraduate and postaduate students. He is also an experienced and pable administrator, and his dispassionate matterfactness has always been greatly appreciated by colleagues in committee. When the foundation of new University College on the African Continent d become a welcome reality, the question of who uld be made responsible for the development of aching and research in the biological sciences was matter of great interest in view of the natural portunities offered at Salisbury. Those responsible r the present appointment are to be congratulated having made a most appropriate choice.

### Prof. A. S. Boughey

In appointing Prof. A. S. Boughey to its chair of tany, the University College of Rhodesia and yasaland has selected a botanist with a wide perience of tropical Africa, and a background hich should prove most valuable in this post. After king a research degree at Edinburgh, Prof. Boughey oceeded to the Sudan, where he spent the war years s plant pathologist in the Department of Agriculture. e returned to Britain to teach botany in the niversity College of the South-West; but when the niversity College of the Gold Coast was established n 1948, he was one of the first appointments to the taff, as professor of botany. During the following ears, he succeeded in building up a strong department which, though in temporary premises, was well quipped and well staffed, and soon became an fficient instrument of teaching and research. While n the Gold Coast, Prof. Boughey gave particular ttention to developing a herbarium as a research ool, and to establishing a large botanical garden. n recent years, his research interests have mainly been in descriptive ecology; he has studied the vegetation types along the Guinea coast, and has given special attention to altitudinal zonation in the mountain massifs of West Africa, particularly the Cameroons Mountain. He will take to Salisbury experience from two other very different parts of the African continent, and a record of success in building up a new botany department from the foundations under similar conditions. This should augur well for the future of botany in Rhodesia.

### Peaceful Uses of Atomic Energy

Further details have recently been announced on the International Conference on Peaceful Uses of Atomic Energy, which will be held in Geneva during August 8–20 (see *Nature*, April 9, p. 615) in association with two exhibitions (see *Nature*, May 28, p. 929). The official delegation from Great Britain will consist of Sir John Cockcroft, director of the Atomic Energy Research Establishment, Harwell; Sir Christopher Hinton, managing director of the United Kingdom Atomic Energy Authority Industrial Group; Dr. J. F. Loutit, of the Medical Research Council and Agricultural Research Council; Sir George Thomson, of the Royal Society, representing British universities; and Dr. Willis Jackson, of Metropolitan-Vickers Electrical Co., Ltd., representing British industry. Sir Edwin Plowden, chairman of the United Kingdom Atomic Energy Authority, will also attend, and advisers to the delegation will include representatives of the Atomic Energy Authority Research and Industrial Groups, the Chemical Research Laboratory, the Medical and Agricultural Research Councils, the Department of Scientific and Industrial Research, the Ministry of Defence, the Ministry of Fuel and Power, the Institution of Civil Engineers, British universities and a number of industrial concerns. The total number of delegates, advisers and staff for the conference and exhibitions, excluding the industrial representatives attending the exhibitions, will be more than a hundred and sixty. More than a hundred papers were submitted to the United Kingdom Papers Committee, and sixty-seven will be read, the remainder being included in the report of the proceedings which will be published. Including those from Britain, more than a thousand papers were submitted altogether, and, of those selected for reading, more than seventy will be from the U.S.S.R. and about a hundred and seventy from the United States. Other countries presenting papers are: Australia, Belgium, Brazil, Canada, Czechoslovakia, France, India, Israel, Japan, Norway, Poland, Portugal, Sweden, Switzerland, The Argentine, The Netherlands and Yugoslavia.

### Pan-Malayan Scientific Advisory Council

As a result of a suggestion made by the Commission on University Education in Malaya that a scientific advisory council should be set up, representing the Governments of the Federation of Malaya and of Singapore and the University of Malaya and including experts from the planting and mining industries and the fields of agriculture and medicine, the Pan-Malayan Scientific Advisory Council has been formed, with the Chancellor of the University of Malaya as president. Its functions are to promote the spread of scientific information; to advise on scientific problems relating to Malaya; and to advise on, and assist in, the co-ordination and finance of scientific research, with power to receive and administer endowments, donations and grants. Participation in the work of the Council and its Committees by the Governments of Sarawak, North Borneo and Brunei will be welcomed, if they so desire. The main work of the Scientific Advisory Council will be undertaken by technical committees, six of which have been set up, each under its own chairman, as follows: *Animal and Vegetable Life and Resources*, Mr. D. W. Le Mare, P.O. Box 459, Penang; *Medical and Veterinary*, Dr. J. W. Field, Institute for Medical Research, Kuala Lumpur; *Economic Affairs*, Sir Sydney Caine, University of Malaya, Singapore; *Mineral Resources*, Prof. E. H. G. Dobby, University of Malaya, Singapore; *Physical Sciences*, Prof. R. A. Robinson, University of Malaya, Singapore; *Social Science and Anthropology*, Prof. T. H. Silcock, University of Malaya, Singapore. The chairmen of the six technical committees, together with three representatives from the Government of the Federation of Malaya, two from the Government of Singapore and two from the University of Malaya, form a Central Committee, under the chairmanship of the Assistant Commissioner-General for Colonial Affairs. The technical secretary of the Pan-Malayan Scientific Advisory Council is Dr. Kiang Ai Kim, of the University of Malaya, Singapore.

### *Veterinary Reviews and Annotations*

Veterinarians and all those who are in any way interested in the welfare of domesticated animals will welcome the appearance of the new half-yearly journal, *Veterinary Reviews and Annotations*, published by the Commonwealth Agricultural Bureaux, Farnham Royal, Slough, Bucks (1, Part 1; April 1955; pp. 54; 25*s*. a year). The journal is edited by W. A. Pool, who is also the editor of the *Veterinary Bulletin* and the "Index Veterinarius". The first issue contains three articles, all of which are valuable summaries of knowledge of the subjects with which they deal. Prof. R. Lovell, professor of bacteriology in the Royal Veterinary College, London, contributes a 27-page review on intestinal diseases of young calves, with special reference to *Bacterium coli*. A section of the review deals with acute gastroenteritis of babies. The bibliography covers more than four pages, and reflects the scope and detail with which the subject is treated. The second article, by Dr. C. Horton-Smith, of the Animal Health Trust's Poultry Research Station, Houghton Grange, Huntingdon, is a valuable review, also well documented, of coccidial and other forms of parasitism in their relation to poultry husbandry. He discusses the risks and advantages of the free-range, semi-intensive, intensive (with built-up litter), folding and wire-floored cage systems of poultry management in relation to the infection of chickens with the pathogenic species of Coccidia and with tapeworms and roundworms. Everyone who is concerned with poultry management should read this up-to-date and detailed review. The third article, by Dr. Phyllis Croft, of the Group Laboratory, Mile End Hospital, London, discusses euthanasia. She deals first with the appreciation of pain by animals and then with methods used to produce euthanasia. A feature of this article is the humane spirit evident in the author's discussion of the development of the methods now being used and of the reasons why older methods have been condemned by the British Veterinary Association and others. If succeeding issues of this new journal reach the standard attained by this first issue, the journal will be an indispensable addition to the reorganization of veterinary literature that has been going on during recent years.

## The Mauritius Institute

THE project for an institute in Mauritius began in 1880 with the object of establishing an institute, museum and library for the "purpose of promoting the general study and cultivation of the various branches and departments of Art, Science, Literature and Philosophy and for the instruction and recreation of the people". The present building was completed in 1884 and the Institute is administered by a Board of Directors. Plans have been prepared to make the Institute more or less autonomous, and the necessary legislation is being drafted. A number of local scientific and cultural societies have become incorporated with the Institute, which at the present time comprises a library, an art gallery and a museum. The Natural History Museum is in Port Louis and the historical material at Mahebourg. At the latter the exhibits include furniture, objects connected with the Grand Port battle, and early maps, lithographs and water-colours recording the life, scenery and customs of the people at different periods. The Natural History Museum is now regional in character, and emphasis is centred on Mascarene topics illustrating biological, ecological and economic relationships. A concentrated effort is now being made to modernize the exhibition part of the Museum according to present-day standards. Research has always played an important part in the activities of the Institute, and the annual list of original papers is impressive.

## First Ascent of Mont Blanc

WHEN Mount Everest was finally conquered Edmund Hillary and Tenzing Norkey on May 1953, the event aroused enormous interest, and the resources of ancient and modern methods communication by runner, telegraph and wirele were available to spread the news rapidly all ov the world. It arrived in Great Britain three da later, during the night of June 1–2, and one of first recipients was the Queen. In the *Notes a Records of the Royal Society of London*, Sir Gavin Beer and Max H. Hey show that conditions we very different when Mont Blanc was first ascend by Dr. Michel-Gabriel Paccard and Jacques Balm on August 8, 1786 (11, No. 2; March 1955). T news was carried by messenger from Chamonix Geneva for the information of H. B. de Saussur who received it on the morning of August 10. Ther after the spread of the news was sporadic, uncerta and slow, depending on the private corresponden of de Saussure and his friends and of tourists wh chanced to be at Chamonix at the time. It was fir published in the *Leipziger Zeitung* of August 2 1786; but the first publication in Great Brita appears to have been in the *Scots Magazine* f November of that year. Yet it also was a great an important event, and a small number of persons Great Britain must have learned the news privatel

## Institution of Telecommunication Engineers, Ind

THE Institution of Telecommunication Enginee was inaugurated in India in November 1953, and a the first annual general meeting held recently in Ne Delhi, considerable progress in membership an activities was reported. The Institution comprise all the specialized branches of telecommunications i India, and its membership of more than a thousan is drawn from various government-operated communications agencies, the three defence service research institutes and industry. Like most professional bodies, the Institution prescribes minimum educational qualifications and experience for entr into its several categories; but direct admission int the lower categories is also possible by passing th examinations which are to be conducted by it. Th first issue of a quarterly *Journal* is about to be published. Talks and discussion meetings are arrange periodically in New Delhi, the headquarters of th Institution, and similar activities are being planne in Bombay, Calcutta, Madras, Poona, Bangalore an Jabalpur. Further particulars can be obtained fron the honorary secretary of the Institution at Pos Box No. 481, New Delhi.

## Colorimetry and Theories of Colour Vision

IN an address given to the Physical Society Colou Group on May 18, Dr. D. B. Judd, of the Nationa Bureau of Standards, Washington, D.C., said tha colorimetry can contribute to the understanding o the mechanisms underlying the seeing of colours i three ways: by determining metamers, that is, several groups of different spectral stimuli which when mixed produce identical sensations; by the characterization of the attributes of chromatic sensations, particularly hue sensation; and by determining the spacing of subjective colours. As regards the first, the law of additivity, on which the interpretation of all colour matches is based, is not at present thought to be rigidly valid, although it is certainly a good approximation to the truth. Dr.

dd emphasized that any theory of colour vision ist be so framed that it can be expressed in terms a triple matrix which is necessary to account for tamerism. This is true of the Müller zone theory, nich also predicts correctly the locus of constant turation in a colour chart; its third stage, just as ering's theory, can account for the Brücke–Bézold onstant hue) phenomenon. In describing the unsell colour system, Dr. Judd said that American lorimetrists have recently, and reluctantly, reached e conclusion that it is impossible to devise a single stem for constant hue, saturation and brightness d simultaneously to have equal geometrical spacing. eir present object is to develop a 'homogeneous tropic colour space'. Showing data in which otoelectric measurements and numerous sub- ctive judgments of the appearance of ceramic mples were correlated, he said that in general the rrelation is better for red than it is for buff, and r this colour it is better than it is for brown (red mples reveal a breakdown of the Brücke–Bézold enomenon). Dr. Judd concluded by pointing out at colorimetrists have accumulated a vast body of ta which awaits digestion and treatment on a eoretical basis. Not one of the least tasks of eories of colour vision will be to account for the agnitudes of the sensory differences as encountered the above correlative experiments.

## ora of Egypt: a Further Contribution

WITH the appearance of Vol. 3 of the "Flora of gypt" (published as a Bulletin of the Faculty of cience, No. 30, pp. 1–644; Cairo University, 1954), is ambitious and scholarly floristic study has been ken a stage further. In this volume the authors, ivi Täckholm and Mohammed Drar, deal with ngiospermae, part Monocotyledones, Liliaceae– usaceae. This detailed and thorough piece of work corporates a revision of all the available botanical aterials, together with an extensive reference list. he citation of the localities in which the species and arieties have been recorded should be of value in cological and other researches, while the references the medicinal and other practical uses of species, nd to linguistic, historical and artistic aspects not nly carry their own interest—and in some instances his is a very considerable interest indeed—but also ake a very real and substantial contribution to eneral scholarship. As an indication of the authors' reatment, the account of the genus *Allium* extends ver some seventy-eight pages and includes a general reatment of the genus; a practical diagnostic key; n account of the species, their localities and varieties; otes on the species cultivated in Egypt; records of *llium* in Ancient Egypt (with linguistic notes, *llium* species as food, as used in mummification, tc.); the genus in later historical periods; its use s drugs; and an extensive bibliography.

## read Rolls made with Fish Flour

IN co-operation with the Chilean Government, the ood and Agriculture Organization of the United ations has recently completed successful large-scale rials with a protein-rich fish flour which is free from fishy flavour. One hundred and forty Chilean hildren between five and fourteen years old were iven daily a 90-gm. bread roll containing 10 per cent f fish flour with their school lunch. The bread was lightly darker than ordinary bread, but similar in mell, taste, form and consistency, and was eaten by he children without complaint and with no digestive ill-effects. These tests by the Food and Agriculture Organization are of great importance to technically under-developed countries where diets are low in high-grade animal proteins. Foods to meet these deficiencies must be cheap and be able also to stand transport and storage, often under most unfavourable conditions, without deterioration. Edible fish meal, or fish flour, meets these conditions. It is inexpensive, the protein content is high and processing costs are low. Until recently, however, the fishy flavour has made it unpopular, and efforts have been made to develop a flavourless fish flour. The flour used in the Chile tests was produced by a South African firm which has been working for some time on a secret process. The United Nations Children's Fund has now set aside funds to be spent on similar trials of fish flours in other areas with the assistance of the Food and Agriculture Organization.

## Zoological Nomenclature

THE International Commission on Zoological Nomenclature gives notice that, as from November 31, 1955, it will start to vote on the following cases involving the possible use of the plenary powers for the purposes specified against each entry. Full particulars of these cases were published on May 31 in the *Bulletin of Zoological Nomenclature* (11, Parts 5 and 6; 1955). (1) *Sphenodon* Gray, 1831 (Cl. Reptilia), validation of emendation from *Sphaenodon*; Sphenodontidae Cope, 1870, validation of; (2) *Hemiprocne* (Cl. Aves), validation of, as from Nitzsch, 1820; (3) *Fistulipora* McCoy, 1849 (Cl. Bryozoa), validation of; (4) *Aucella* Keyserling, 1846 (Cl. Lamellibranchiata), validation of; (5) *Muntiacus* (Cl. Mammalia), validation of, as from Rafinesque, 1815; (6) *Scorpio* Linnaeus, 1758 (Cl. Arachnida), designation of *Scorpio maurus* Linnaeus, 1758, as type species of, and suppression of *europaeus* Linnaeus, 1758; (7) *Oxypoda* Mannerheim, 1831 (Cl. Insecta, Order Coleoptera), designation of *Oxypoda spectabilis* Maerkel, 1844, as type species of; (8) *gambianus* Ogilby, 1835 (Cl. Mammalia), validation of, and designation as type species of *Heliosciurus* Trouessart, 1880; (9) *silvestris* Schreber, [1777], validation of, as name for European wild cat; (10) *Phacochoerus* Cuvier, 1826 (Cl. Mammalia), validation of; (11) *Odobenus* Brisson, 1760 (Cl. Mammalia), validation of. Proposals are also made for the adoption of 'declarations' defining (*a*) the expression 'monotypical genus', and (*b*) the combination to be attributed to the specific name for a species described as belonging to one genus, but for which at the same time a second nominal genus is established conditionally. Attention is also directed by the Commission to the proposed rejection of names given to the 'Piltdown Man' as being names given to a fictitious form. Comments should be sent as soon as possible to Francis Hemming, secretary to the Commission, 28 Park Village East, Regent's Park, London, N.W.1.

## University of Sheffield

THE following appointments have been made in the University of Sheffield: Dr. G. Porter, to the newly established chair of physical chemistry; Dr. V. R. Pickles, senior lecturer in physiology; Dr. G. M. Leak, lecturer in physics; Dr. W. F. Ford, lecturer in refractory materials; Dr. L. Ainsworth, lecturer in glass technology; and Miss H. G. Medlicott, map-curator and librarian in the Department of Geography.

## Medical Fellowships of the National Research Council, Canada

THE National Research Council of Canada has recently awarded six senior medical research fellowships and twenty-one graduate medical research fellowships, totalling 81,700 dollars in value plus travelling allowances when required. The recipients and the places where they will work are as follows. *Senior Medical Research Fellows:* Dr. W. G. B. Casselman, Banting and Best Department of Medical Research, University of Toronto; Dr. C. N. Crowson, Department of Pathology, Queen's University, Kingston, Ontario; Dr. J. M. Finlay and Dr. R. W. Gunton, Toronto General Hospital and the Department of Medicine, University of Toronto; Dr. P. C. Fitz-James, Department of Bacteriology and Immunology, University of Western Ontario; Dr. J. W. Pearce, University of Western Ontario. *Graduate Medical Research Fellows:* Dr. C. W. Baugh, Department of Physiology, Queen's University, Kingston, Ontario; Dr. S. A. Carter, Dr. W. B. Ewart and Dr. G. F. Winkler, Department of Physiology and Medical Research, University of Manitoba; Dr. R. W. Cornett, Department of Medicine, Harvard Medical School; Dr. J. W. Dawson, Department of Pathology, Banting Institute, University of Toronto; Dr. C. J. P. Giroud, Department of Investigative Medicine, McGill University; Dr. H. Kalant, Department of Biochemistry, University of Cambridge; Dr. Dorothy C. H. Ley, Toronto Western Hospital; Dr. J. Loiselle and Dr. A. E. Malkin, Department of Biochemistry, McGill University; Dr. A. M. Lansing, Department of Physiology, University of Western Ontario; Dr. G. G. Mathieson, Department of Neurophysiology, Montreal Neurological Institute; Dr. J. McGraw, Institute of Experimental Physiology, Laval University; Dr. I. R. McLean and Dr. R. Volpe, Department of Medicine, Toronto Western Hospital; Dr. J. W. Meakin and Dr. J. C. Nixon, Department of Biochemistry, University of Toronto; Dr. J. H. Mowbray, Department of Pathology, University of Toronto; Dr. J. G. J. Pepin and Dr. B. Therien, Department of Clinical Research, Hotel Dieu Hospital, Montreal.

## Nuclear Engineering Courses at New York University

THE College of Engineering of New York University is setting up a number of courses in nuclear engineering for students who already have a bachelor's degree in science or engineering and who wish to proceed to the new degree of master of nuclear engineering. Subject to the approval of the United States Atomic Energy Commission, a sub-critical reactor will be built this autumn at the University at a cost of a few thousand dollars, with uranium lent by the Commission. It will consist of a five-foot tank of water in which two tons of uranium rods are placed; the neutron source, consisting of polonium and beryllium, will be housed beneath floor level and will be hoisted up among the uranium rods by remote control. The power will be 1/300 W., and the neutron intensity of the order of a hundred million neutrons per second. This is enough for such experiments as foil irradiations, Geiger-counter studies, and Szilard–Chambers observations. With this apparatus students can be trained in a realistic and practical manner in the physics of the chain reaction, reactor theory and diffusion theory.

## Announcements

THE Paris Academy of Sciences has elected Pr D. Keilin, lately Quick professor of biology a director of the Molteno Institute, University Cambridge, to be foreign associate; and Prof. Gaussen, professor of botany in the University Toulouse, to be *correspondant* for the Section Rural Economy.

SIR GORDON RADLEY, deputy director-general, a formerly engineer-in-chief, of the Post Office, h been appointed director-general in succession to S Alexander Little, who is retiring.

DR. F. H. K. GREEN, principal medical officer the headquarters staff of the Medical Research Coun since 1949, has been appointed scientific secretary the Trustees of the will of the late Sir Henry Wellcom (The Wellcome Trust, 24 Harley Street, Londo W.1), with effect from October 1; he will according leave the service of the Medical Research Council September 30.

MR. S. CULPIN, director of Gleadthorpe Expe mental Husbandry Farm, Welbeck Colliery Villag Mansfield, Notts, has been appointed director of t Experimental Husbandry Farm which is bei established at Drayton in Warwickshire when th farm is taken over from the Grassland Researc Station in September next.

THE Documentation Committee set up by th Society of Chemical Industry in 1952 is publishing *Chemistry and Industry* periodical lists of amendment to the third edition of the "World List of Scientifi Periodicals", and three have so far appeared. The include certain amendments to library holdings aft 1950. Details of any errors discovered in the lis should be sent to the honorary secretary of th Committee, Miss M. I. Wyatt, Laboratories, J. Lyon and Co., Ltd., 149 Hammersmith Road, Londo W.14, from whom further information can b obtained.

THE Admiralty is arranging a summer school fo university and technical college teachers on scientifi problems which arise at all stages in the develop ment of electronic devices, to be held at the Service Electronics Research Laboratories, Baldock, Hert and Harlow, Essex, during September 20–2 Leading scientific workers from industrial an government laboratories will discuss their problem and practical demonstrations of modern valve an transistor development techniques will be give Further information can be obtained from the Deput Director of Physical Research (C.V.D.), Admiralty 20 Great Smith Street, London, S.W.1.

IN *Nature* of January 1, 1955, p. 26, reference wa made to the work in the United States of the Anima Care Panel. We are informed that the Proceeding of the annual meetings of the Animal Care Panel ca be purchased from the Secretary-Treasurer of th Animal Care Panel, Dr. Robert J. Flynn, P.O. Bo 299, Lemont, Illinois, U.S.A., directly or throug booksellers in the United Kingdom, at the followin prices (plus postage): 1950, 1 dollar; 1953, 3 dollars 1954, 4 dollars, or from the Laboratory Animal Bureau, M.R.C. Laboratories, Holly Hill, Hampstead London, N.W.3, at the following prices (post pai within the U.K.): 1950, 7*s*. 9*d*.; 1953, 22*s*. 9*d*. 1954, 30*s*. Proceedings for 1951 and 1952 are n longer available.

# INTERNATIONAL CONFERENCE ON COAL SCIENCE

PROGRESS in the study of coals as chemical substances, and in the measurement of their ntrinsic physical properties as distinct from mechnical characteristics, has been very slow. Coals form well-defined family of organic substances with eculiar properties that differentiate them clearly om other natural products and render difficult their udy by orthodox chemical methods. Throughout his century small groups of research workers have evertheless attempted this task; and in the years mmediately following the formation of the Coal Research Club by R. Lessing and R. V. Wheeler in 921, it was possible for almost all relevant work to e discussed adequately between those principally nvolved. The situation has now changed radically. There has been an awakening of interest in many ountries, stimulated partly by competition from ther fuels and partly by the shortage of coals suitble for making metallurgical coke, a process basically ependent upon chemical properties. The development of team-work, resulting in a rapid increase in he volume of publications, has coincided with a ecrease in opportunities for its wider discussion. While many of the older views on coal constitution ave been confirmed in principle, definitely established facts date almost exclusively from the past decade or two. Concomitant with this increase in greed knowledge, many apparently incompatible observations have been made, and the need for personal contact between workers in the field was never more evident.

Within the United States, this purpose has been admirably served by the residential Gordon Conferences on Coal, sponsored by the American Association for the Advancement of Science and occupying a full week in each year. The proceedings are, however, private, and European representatives are normally very few. After his return from America o Germany in 1949, Prof. W. Fuchs attempted to meet this need by inaugurating annual *Steinkohlenagungen* at Aachen, where he holds a chair of technical chemistry at the Technische Hochschule. The papers delivered, but not the discussions, were normally published in *Brennstoff Chemie*. These conferences proved most valuable, but a need was felt for placing them on a broader all-European basis. This feeling was given expression after the *Steinkohlentagung* of 1954 by the formation of an international Organizing Committee, with the following membership: Prof. D. W. van Krevelen, president (Netherlands); Dr. I. G. C. Dryden (Great Britain); Prof. W. Fuchs (Germany); M. E. H. Grand'ry (Belgium); M. R. Loison (France); Dr. M. Th. Mackowsky (Germany); and Dr. D. C. Rhys-Jones (Great Britain).

The first International Conference on Coal Science was accordingly held during May 2–3 at Heerlen in the Province of Limburg, Netherlands. It was attended by more than ninety participants from eight countries; interest in Great Britain was attested by the size of the British contingent, which numbered sixteen, and the United States was indirectly represented by two members of European Research Associates (Brussels), a branch of the Carbide and Carbon Chemicals Company. The town hall of Heerlen was placed at the disposal of the Conference, and the municipality gave every assistance to the organizers; at the conclusion of the official sessions, members of the Conference were offered hospitality by the burgomaster, Mr. M. F. G. M. van Grunsven.

On the morning of each day, general lectures each covering a definite field of coal science were delivered and discussed, and the afternoons were devoted to short communications covering special aspects of these fields. An attempt was made to restrict the subject-matter to coal science as distinct from coal technology; but even so a wide range of topics was covered. The theme on the first day was "The Genesis, Constitution and Properties of Coal" (chairmen, Dr. Rhys-Jones and M. Loison); on the second, "Carbonization and Coke Structure" (chairmen, Prof. Fuchs and M. Grand'ry). Discussion of the papers took place during the sessions and at an informal meeting on the evening of the first day.

Lignin is one of the chief materials from which coal has been formed by slow chemical and physical changes. Formation of lignin in the living plant, and its chemical constitution, were discussed by W. Fuchs, who pointed out the wide variety of related substances that can be included under this name. Fuchs also discussed the chemical conversion of lignins and other natural materials into coal, with special reference to his view that the 'redox' potential is an important determinant of the type of product; he adduced evidence suggesting that anaerobic conditions predominated during the early stage of formation of black or hard coal, aerobic conditions during that of brown coal. It is generally considered that the humic acids extractable from peat and humus by aqueous solutions of alkali are intermediates in the process of coal formation. The distribution of humic acids in low-rank coals was discussed by D. J. W. Kreulen, who showed that humic acid content does not necessarily decrease with increasing maturity of brown coals and lignites. Kreulen concluded that the formation of humic acids and the formation of coal are two independent processes; humic acid formation takes place only under conditions of oxidation, and coal can thus be formed either directly or *via* humic acids. It is likely that both processes usually occur simultaneously.

A. Gillet followed, by graphical methods, the changes in elementary composition in passing from plant constituents and peat to high-volatile bituminous coals, and suggested possible structural changes that might be involved.

Several different approaches to the study of the constitution of coal are possible: coal can be converted to simpler materials, for example by hydrogenation and oxidation, and these can then be examined in detail, or alternatively coal itself or primary derivatives such as solvent extracts may be studied directly. S. G. Ward submitted preliminary results of a comprehensive study of oxidized products, intermediate between humic acids and benzene carboxylic acids, produced by oxidizing humic acids with alkaline permanganate, with hydrogen peroxide and with ozone. The humic acids themselves were produced by alkaline permanganate oxidation of deep-mined coal or by alkaline extraction of outcrop coal. Fractions containing between ten and forty carbon atoms in the molecule were obtained by various procedures, including chromatography and methylation; but none could be claimed as a single compound. J. P. Schuhmacher described the solvent fractionation and high-vacuum distillation of fractions obtained by hydrogenating coal in tetralin at 325° C. and 180 atm. The fractions were characterized by physical properties, chemical analyses, molecular weights and infra-red spectra. One of the objectives was the estimation of the mean number of fused aromatic rings in a molecule of product. The results suggested that some of the products were polymeric structures derived from monomers containing a phenanthrene nucleus. I. G. C. Dryden compared knowledge of coal structure derived from infra-red spectra with that from chemical group determinations, and described recent work in the British Coal Utilisation Research Association, in which the two techniques were used for supplementing one another. He showed that the presence, although not the precise amount, of phenolic hydroxyl in lower-rank British coals has now been definitely established by collaboration between W. F. Wyss, working on acetylation of coals, and J. K. Brown, working on the infra-red spectra of coals and their acetylated derivatives. Comparison was also made between the determinations by C. R. Kinney (Pennsylvania State University) of the amounts of acetic acid produced by different coals on oxidation, and the spectroscopic estimation by Brown of the proportion of aliphatic hydrocarbon groups in similar coals. J. Schuyer described the evidence for the existence in coal of what he termed 'complexes', namely, associations of molecules within which charge transfer can occur. A semi-quantitative discussion of this concept, in relation to the type and spacing of the lamellar molecules that are probably present and the semi-conducting properties of anthracites, and to corresponding information derived from the molecular refractivities of coals, gave an encouraging measure of agreement. Only one paper dealt directly with physical properties: G. Heinze described comparisons between various forms of hardness test using continuous or alternating load. A correlation was found between micro and macro Vickers hardness.

On the second day, three papers dealt with aspects of the mechanism of plastic softening of coal, particularly during carbonization. This softening, accompanied by the development of a sticky consistency, is essential to the production of a strong large coke from small particles of coal. The ultra-fine porosity of coal particles is also relevant to its behaviour in carbonization; and mechanical aspects related to the physical effects accompanying the hardening of plastic coal to solid semi-coke, which have great influence on the crack structure and strength of the resulting coke, were also described. The physical examination of cokes by microscopy, other optical methods, and X-ray diffraction formed the theme of further papers; and finally, a test for the reactivity of high-temperature coke to carbon dioxide (an index of its behaviour in combustion and in metallurgical plant) was described.

The plastic softening of coal on heating was discussed at length by D. W. van Krevelen. Measurements of plastic and swelling behaviour were shown to be consistent with the hypothesis that a metastable liquid intermediate is first formed and afterwards decomposed. It was shown that small differences between the activation energies of these two consecutive pyrolytic reactions can account for many of the differences observed between coals. A mixtu of a low-melting polymer, a substance yielding ga on thermal decomposition, and a condensing age to promote further polymerization was found t simulate closely the carbonizing properties of typical coking coal. D. FitzGerald described measur ments with a Gieseler plastometer of the rate hardening of plastic coal at constant temperature—that is, of the second stage of pyrolysis mentione above—which he has fitted to a first-order reactior rate equation, deriving velocity constants. Activatio energies were almost independent of the rank (c maturity) of the coal tested; the values fell in narrow range around 50 kcal./mole. It was als found that addition of a small amount of 9–1 dihydro-anthracene decreased the reaction velocity it was suggested that decomposition of this additive released atomic hydrogen which retarded th cross-linking or hardening of the plastic coa J. W. Phillips discussed plastic flow of coal at room temperature, which can be induced by briquettin and by other well-known techniques, and suggeste that the behaviour of coal in this respect is analogou to that of any other brittle and extensively cracke material, and is not directly related to the plasti softening of coal on heating (which involves decomposition).

Coals have an extensive ultrafine porous structur and have been shown to behave as molecular sieves A study of this aspect, using the measurements o heat of wetting, adsorption and apparent densit as an indication of the extent of penetration of given liquid into a coal particle, was described by R. L. Bond. The structure of bituminous coals i characterized by two modal sizes of constriction both of the order of tens of angstroms, and thi structure is rather surprisingly found to persist with relatively minor changes in dimension up to carbonization temperatures of 600° C. and above. Above 600° C. the structure is less apparent because it i penetrable only by very small molecules such as those of hydrogen and helium, and can only be studied by measurements of adsorption or apparent density. This fine structure is important in determining the ease of escape of volatile pyrolysis products and therefore the degree of their secondary decomposition; it also influences the extent of plasticization achieved by a given amount of fluid decomposition product.

The strength and size of a coke are important in relation to its use in blast furnaces and cupolas, where a heavy metallurgical burden has to be supported, and the voids must not be choked by degraded coke particles. These properties are influenced to an important extent by the fissuring that occurs during and after solidification of the plastic coal mass. Fissuring depends on the temperature gradient near the plastic zone in the coke oven, on the rate of hardening, on the temperature of hardening, and on several other factors. A. F. Boyer discussed the distinction between local mechanical properties of the coke and the strength of larger pieces containing fissures; a laboratory mechanical test depending on the curvature observed when a layer of coal is coked by heating from the underside was described; the microscopic observations of coke in polarized light were shown to emphasize heterogeneity of coke particles. Application of the many principles described to the practical improvement of coke prepared from given coals was then discussed: for example, the importance of the relationship between the temperature of maximum rate of decomposition and that solidification, and of the relative solidification nperatures of the constituents in blends of coal.

M. Th. Mackowsky illustrated the value of micro-pic investigations in studies of coke structure and ength. Proof was adduced that the macropore stem of cokes, which can be studied by this method, nsists of intercommunicating chambers. B. Alpern o contributed to this subject, describing the use of croscopy in reflected polarized light in recog-zing coke constituents of differing optical aniso-py. It was shown that different coals in blends not mix intimately during carbonization. S. Durif mpared cokes by X-ray diffraction measurement of e degree of graphitization after heating to 2,000° ; many factors involved in its formation at lower nperatures were shown to affect this characteristic.

Finally, A. Dahme described a method of determ-ing reactivity of coke to carbon dioxide in terms the reaction velocity at 1,100° C. and the activation ergy of the reaction. He showed that cokes differ the relative extent to which reaction takes place the outer surface of the particles and on the ternal surface.

## CONGRESS OF CELL BIOLOGY

THE Eighth International Congress for Cell Biology was held at Leyden in September 1954. It was ganized by a Dutch Committee including Prof. . Boeke as honorary president, Prof. P. J. Gaillard president, Dr. W. K. H. Karstens and Dr. Johanna . P. Zaaijer as secretaries. The Dutch Committee was ting on behalf of, and with the advice of, the nternational Society for Cell Biology.

As was the case with all the recent congresses in is field, the view was taken that cells constitute one the definitive levels of organization of living matter nd that, for the proper appreciation and discussion cellular phenomena, all cellular and sub-cellular iological phenomena are relevant. Consequently e Congress covered a very wide field. The arrange-ents made by the organizers provided admirably for ose who wished to obtain a general view of the field, well as for those whose interests were more re-ricted. In the afternoons there were a number of arallel sessions, many of them symposia, which pro-ided for detailed discussion in a wide variety of fields. was, of course, impracticable to attend more than ne of these sessions; but the common morning ssions were organized to enable all who wished to o so to obtain a bird's-eye view of many major fields. he morning lectures were upon the following topics: duced enzyme synthesis; intercellular substances; nmunobiological concepts of growth and differentia-ion; biochemistry of gene action; virus synthesis; olated mitochondria; phase-contrast microscopy; -ray methods in histochemistry; microradio-raphy; chromosome structure; thyroid secretion; orphogenetic interaction between cells; cell division nd mitotic poisons; facilitated diffusion and active ransport; electron microscopy of cells. On the whole his scheme worked well; but its success was limited y the failure of some of the lecturers to give broad urveys.

Scientifically, the chief value of the Congress lay artly in the general survey which was made of a arge part of cell biology, and partly in the provision f ample time for informal discussion. One of the ost valuable arrangements was the provision of discussion rooms to which any small group which arose spontaneously could resort to pursue any topic which it wished to consider. As regards subject-matter, perhaps the most striking feature was an indication that the gulf between the students of chromosome morphology and other cell biologists is beginning to narrow.

The able organization of the scientific aspects of the Congress was paralleled by the excellence of the social activities. The Congress was opened in the Pieterskirk by addresses from Prof. Gaillard, from the President of the Board of Curators and the Rector Magnificus of the University. One of the Dutch hosts remarked that the growth of fingers in tissue culture presented those interested in criminal law with some unusual problems. The president of the Society for Cell Biology, Prof. E. N. Harvey, was prevented from attending by illness; but his speech was read by Paul Weiss in a style which was widely appreciated. There were a number of other attractive social functions, of which the most outstanding was the reception given by the Netherlands Government in the Amsterdam Rijksmuseum. Here, in addition to the permanent collection, there was a remarkable exhibition of Indonesian art. From every point of view, the Dutch Committee succeeded in making the Congress an outstanding success.

The Congress was preceded by a meeting of the Cytochemistry Commission of the Society for Cell Biology. The Commission was established in 1950, by the Society, to accelerate the study of cyto-chemical techniques. The Commission held a meeting, lasting two days, in Prof. Gaillard's laboratory. Recent progress in cytochemical techniques for the study of nucleic acids, proteins, polysaccharides and various enzymes was reviewed. The Commission was able to report that much progress had been made since its first meeting (in 1951).

At the end of the Congress it was decided to accept an invitation to hold the Ninth Congress at the University of St. Andrews, Scotland. This will take place during August 28–September 3, 1957. The Executive Committee responsible for the Congress will include Dr. Honor B. Fell (*chairman*), Prof. H. G. Callan (*secretary*), Dr. Robert Brown and Prof. M. M. Swann. The following officers of the Society for Cell Biology were elected: *President*, Prof. P. J. Gaillard; *Past-President*, Prof. E. N. Harvey; *Vice-Presidents*, T. Caspersson, H. B. Fell, P. Weiss; *Secretary*, Prof. J. F. Danielli.

## BRITISH GELATINE AND GLUE RESEARCH ASSOCIATION

### RESEARCH PANEL MEETING

THE tenth meeting of the Research Panel of the British Gelatine and Glue Research Association was held on May 17, with Mr. S. G. Hudson (Richard Hodgson and Sons, Ltd.) in the chair. Two papers were presented, and at the close of the meeting those present visited the Association's laboratories at 2*a* Dalmeny Avenue, Holloway, London, N.7.

The first paper, "Recent Research on the Mech-anism of Photographic Sensitivity", was given by Dr. J. W. Mitchell (H. H. Wills Physics Laboratory, University of Bristol). Dr. Mitchell described the recent series of experiments which he and his col-laborators have carried out, aimed at providing definite experimental answers to many of the speculations which have been put forward from time to time to account for the behaviour of silver halide emulsions. The most important step in this work has been the preparation and use of large single crystals of silver bromide in the form of thin parallel slabs. These can be obtained either strained or, by an annealing process, strain-free.

The results of sensitization by immersion in gelatin solutions, by digestion with gelatin solutions which could be modified by the addition of reducing substances, sulphur-containing sensitizers and potassium chloro-iridite, were described. Chemical sensitization appears to arise from silver, gold or silver sulphide produced at strained or roughened regions on the surfaces of the crystals. By direct deposition of silver and gold on the surfaces, it was possible to check this view, and silver films could also be converted to silver sulphide. On exposure of silver bromide to light, halogen atoms are released, and chemical sensitizers function by reaction with the released halogen. The recent results have brought into prominence some of the older theories of sensitivity. A lively discussion, opened by Mr. R. C. M. Smith (Ilford, Ltd.), followed the paper, and gave Dr. Mitchell the opportunity to expand his account of certain aspects of the work.

The second paper, given by Dr. C. H. Bamford (Courtaulds Fundamental Research Laboratory, Maidenhead), was on "Synthetic Polypeptides", and in it the work which has been carried out at Maidenhead was reviewed and related to the behaviour of proteins. The configuration of polypeptide chains can be examined by such physical methods as absorption of polarized infra-red radiation, which enables the directions of the —NH and —CO groups to be determined, by X-ray diffraction spectra, where certain polypeptides give results in close agreement with those to be expected for the 3·7 helical structures proposed by Pauling, and by optical rotation. Synthetic polypeptides occur in two configurations: $\alpha$, referred to above, with intrachain hydrogen bonding; and $\beta$, an extended form with interchain hydrogen bonding. These correspond closely with structures found for natural proteins such as keratin and silk; but an analogue for collagen has not been found yet. The discussion on this paper was opened by Mr. A. G. Ward (British Gelatine and Glue Research Association).

A. G. WARD

# WATER POLLUTION RESEARCH IN BRITAIN

TO those whose work or interest lies in river pollution prevention, water treatment, and sewage and trade wastes purification, the study of the annual reports of the Water Pollution Research Board and of the Director of Research is at once a necessity and a pleasure. The report for 1954[*] easily maintains the interest and information that have characterized previous reports.

A notable event of the year was the completion and occupation of the new laboratories at Stevenage, Hertfordshire, which now house all the staff who were previously working at Watford, Garston, Birmingham, Coventry and Tilbury. Thus for the first time since the formation of the organization in 1927, all the staff are together in one building—a great advantag for future work. The new laboratories have a numbe of novel features; among the many facilities may b instanced a small pumping station, which can delive up to 50,000 gallons of sewage daily to experiment plant (see also *Nature*, June 25, p. 1105).

The largest section of the report comprises a account of the progress made in the complex surve of the Thames Estuary. Here it was found necessa to undertake the fundamental task of redeterminin the values of the solubility of oxygen in water, ove a range of temperatures and salinities, in equilibriu with moist air of normal composition at sea-leve The values so obtained were found to be 3–4 pe cent lower than those commonly accepted hithert Part of this work involved the checking of the well known Winkler titrimetric method for the determination of dissolved oxygen against a referenc gasometric method, establishing that the former without appreciable error. Other studies included statistical examination of the chemical records of th London County Council concerning the condition o the Thames, and the factors controlling the balanc of oxygen in the estuary water—that is to say, th amount of fresh water entering at Teddington, th absorption of oxygen from the atmosphere unde various surface conditions, the effect of syntheti detergents upon the absorption and the rate o oxidation of polluting matter, including the effect o bottom deposits removed by dredging. Both field investigations and laboratory experiments have no been terminated; but the final conclusions await th completion of the many lengthy calculations tha have to be made.

A further section of the report deals with the effect of pollution on fish. The Laboratory has assiste the Ministry of Agriculture and Fisheries in a surve of the River Colne, principally regarding the effect o sewage effluent upon fish life. Laboratory experiments are being continued on the degree of toxicity o ammonia, carbon dioxide and synthetic detergent It appears that the degree of toxicity is frequentl related to the amount of dissolved oxygen present—fish can survive doses of toxic substances in well aerated water that would be fatal in poorly oxygenate water.

In the section on sewage, an account is given o the examination of surface run-off water from housing estate, the conclusion being that this wate was not of a very polluting nature apart from it rather high content of suspended solids. Th biological filtration of sewage is discussed as regard periodicity of dosing and efficiency of filters, and als the work so far done on the effect of synthetic detergents upon sewage treatment, where quantitativ information on the subject is by no means abundant

A useful piece of work has been done in conjunctio with the Government Laboratory: that of reviewin methods for determining concentrations of variou metals in waste waters and effluents down t 0·1 p.p.m. The methods suggested are due to b incorporated in the second edition of "Methods o Chemical Analysis as Applied to Sewage and Sewag Effluents" to be published by the Ministry of Housin and Local Government.

Investigations have been continued concerning th removal of cyanides from industrial waste waters by biological filtration; the organism responsible ha been isolated and described. Biological destructio of cyanide in mixed plating wastes has been show to be a practical method for dealing with suc wastes, and if the information resulting from this esearch is properly acted upon by the industries oncerned, a potent source of pollution will be greatly educed. Experiments on the anaerobic digestion of artially neutralized waste liquor from the kiering f cotton were also continued. This method of reatment is a possible one for pre-treatment before ischarge to a public sewer, having the merit first of equiring less space than a percolating filter to effect he same degree of improvement, and secondly of the bility to treat undiluted kier liquor, whereas for a percolating filter the liquor would require considerable dilution.

---

[*] Department of Scientific and Industrial Research. Report of the Water Pollution Research Board, with the Report of the Director of Water Pollution Research for the year 1954. Pp. vi+65+4 plates. (London: H.M. Stationery Office, 1955.) 3s. net.

The section on water is very brief. Experiments are described on the removal of fluoride from water by passage through a column of activated alumina. The reason for the complete blockage of two slow and-filters was investigated and found to be due to deposited crystals of calcium carbonate which had bound the sand grains together, the deposit having been induced by loss of carbon dioxide from the water during previous aeration.

Lastly the report emphasizes that an important part of the Laboratory's activities is now concerned with the development of automatic equipment. A noteworthy achievement has been the production of an instrument for the continuous recording of the dissolved oxygen content of a stream of water, thus giving valuable information about fluctuations that would usually be missed by the methods of intermittent sampling that otherwise have to be employed.

# STANFORD RESEARCH INSTITUTE, CALIFORNIA

## REPORT FOR 1954

THE annual report for 1954 of the Stanford Research Institute, California*, records an increase of 242 in the staff during the year, and, of these, 165 have professional training and five to ten years of industrial experience. The staff now totals 916, and the revenue has increased by 40 per cent to 7·57 million dollars. Contract research is now being conducted at the rate of 8·5 million dollars a year, and the number of research projects has increased from 382 to 478, of which 297 were for private business, 128 for the Government and 53 were sponsored by the Institute as part of its plan for aiding the technological and economic development of the western part of the United States. In terms of dollars, the ratio of commercial projects to government projects was 54 : 46—an almost exact reversal of the ratio in 1953.

The 53 public service projects include studies of air pollution and high-temperature materials, of industrial water resources in California and of surface tension in solids; research on human engineering in industry; the effect of γ-radiation on high polymers; a survey of industrial land use in the Portland area; and the production of such reference works as the "Western Resources Handbook", "The Chemical-Economics Handbook" and "The Directory of Western Chemical Producers". The Institute also sponsored symposia on the automatic production of electronic equipment, on social science for industry and on area development problems.

In the Engineering Division electronics claims the largest share of attention, particularly the theoretical analysis of antenna systems, the design and manufacture of prototypes and the performance of radiation systems. The Physical Sciences Division has dealt with the production of chemicals from petroleum, utilization of wood waste, tallow, bagasse and fish waste, as well as the properties and applications of polymers, the storage and utilization of solar energy, the effect of infra-red radiation on chemical reactions, the use and control of sound waves and with the weapons-effect programme. The Division is also engaged in biochemical research and on problems in nutrition, microbiology, physiology and toxicology, while expansion into pharmacology is in progress. The Economics Division is concerned with three broad categories of work: the economic analysis of problems for specific companies; the examination of specific functions, such as the application of electronic data-handling equipment to accounting and clerical operations, the application of operational research in management and the industrial application of social science; and the use of economic surveys in area development, including also the location and protection of plant, military logistics and weapons-system evaluation.

In the Poulter Laboratories contributions have been made to the understanding of shock waves and detonations which have increased the effectiveness of explosives both for military purposes and in mining, agriculture and demolition. The Institute's work on defence against nuclear bombs has shown that earth-covered steel-arch structures above ground provide a significant level of protection at economical cost; but that most ordinary structures not specifically designed for the purpose are not significantly strengthened against blast by earth cover. Work on rocket liners has shown that detonation in tubes can be limited by absorbing compression-wave energy at the walls and, in work on graphite nozzles for liquid fuel rockets, a new technique for converting graphite to metallic carbide for an appreciable depth has given promise. A non-destructive test device, called a stub meter, for the plastic-adhesive bonded sandwich has been developed by the Institute physicists. Ten common weeds, grown under controlled conditions, have now been standardized as indicators of atmospheric pollution by hydrogen fluoride, sulphur dioxide, hydrogen sulphide, ammonia, chlorine and oxides of nitrogen. Under a project sponsored by the Southern Pacific Co., the hydrofriction system for freight cars has been developed to distribute the impact of energy more evenly or at a more constant rate by new shock-absorbing mechanisms.

# METABOLISM OF RADIOACTIVE SUGARS

H. K. PORTER and L. H. May have followed the uptake and utilization of radioactive sugars by tobacco leaf disks (*J. Exp. Bot.*, 6, 16, 43; 1955). When destarched tobacco-leaf disks were floated on 5 per cent (w/v) solutions of sucrose uniformly labelled with carbon-14 in either the glucose or fructose moiety, and on invert sugar in which one hexose only was so labelled, in an atmosphere of oxygen at 25° C., seventy-five per cent of the sugar lost from the external solutions was recovered as starch, sucrose, fructose, glucose and carbon dioxide.

With sucrose as the substrate, 30 per cent of the material was recovered as carbon dioxide, and 17 per cent each as starch, sucrose, fructose and glucose. With invert sugar as the substrate, 30 per cent was again recovered as carbon dioxide, only 20 per cent as the three sugars together, and 50 per cent as starch.

Whichever hexose was initially labelled and whether the sugar was supplied as sucrose or hexose, the relative specific activities of starch and sucrose in the leaf disks and of the carbon dioxide evolved were equal or nearly equal to that of the sugar supplied.

With sucrose as the substrate the sucrose in the disks retained its asymmetry of label, and free hexoses produced were similarly asymmetrically labelled. When invert sugar was the substrate, the sucrose synthesized was strongly labelled in both moieties, as also were the free hexoses.

It is concluded that fructose and glucose, free or combined in sucrose were equally available for starch synthesis and carbon dioxide formation, and that there can be no question of preferential utilization of one or other hexose. Starch and carbon dioxide must arise from a common source in which readily formed derivatives of the hexoses are rapidly equilibrated. Free hexose cannot participate directly in either sucrose or starch synthesis. Accumulation of sugar not immediately metabolized and inversion of sucrose take place at a site remote from the common pool.

## MARINE BIOLOGICAL RESEARCH

The first number of Vol. 34 of the *Journal of the Marine Biological Association of the United Kingdom* contains ten papers on a variety of marine topics. It commences with an obituary notice of one to whom marine biology owes a very great deal, the late Dr. George Parker Bidder, who died in his ninety-first year last December; he was the last of those connected with the early development and struggle for existence of the Marine Biological Association and its first honorary member. There is a characteristic photograph of him as frontispiece.

In the first of the ten papers, Dr. John R. Baker, working under the auspices of the Universities' Federation for Animal Welfare, describes a method for the humane killing of crabs by piercing the brain with an awl through the sternum of the segment of the first antenna and the ventral nerve mass through the depression at the posterior end of the sternum of the chela-bearing segment. The method can be learned quickly by the fishmonger and canner, and avoids autotomy of the appendages.

Dr. H. A. Cole and Mr. D. A. Hancock record the presence of a small parasitic gastropod in oysters from the River Colne in Essex, *Odostomia eulimoides*, formerly known only from *Pecten maximus* and *Chlamys opercularis*. *Odostomia* attacks the mantle edge of the oyster, causing the formation of a mantle pocket, later of a shell pocket, with thickening of the mantle and shell substance over the pocket, the malformation being visible externally. In severe cases, involving the presence of a number of parasites, the irritation may spread inwards to the adductor muscle, and the deposition of brown shell material on this muscle causes the shell to gape, with resulting suffocation and death. The parasite occurs in the River Crouch in considerable numbers, in other rivers of Essex, and also at Salcombe, Devon, where *Chrysallida obtusa* Brown is here recorded for the first time in oysters. In North Wales, Dr. Knight Jones found *Odostomia scalaris* in mussels. No methods of control are known.

A detailed account of feeding and digestion in terebellids, with special reference to *Amphitrite johnstoni*, and a comparison between this and other members of the family are given by Dr. R. Phillips Dales. Food is collected by ciliary action along the groove on each of the tentacles and, wrapped in mucus, is conveyed to the lips and thence, by an elaborate series of rolling movements, to the mouth. Strong amylase activity, weak protease and lipase activity occur in the fore-stomach, strong enzyme secretion of all three in the fore-intestine and, between the two, mixing of the food by muscular action of the hind-stomach. Absorption takes place in the fore-intestine and anterior part of the hind-intestine. While the structure of the gut and the digestive process are similar in all terebellids, the lips and feeding habits vary in different genera.

Dr. J. E. Morton and Dr. N. A. Holme record the discovery of large numbers of the tectibranch *Akera bullata* in a sea-water tank in the Naval Dockyard at Devonport, the first record for the Plymouth area. The animals were feeding on the thick growth of green algae growing on the sides of the tank and were breeding freely, the majority, however, dying after spawning. A study of its structure leads the authors to the conclusion that *Akera* ought to be removed from the Bullomorpha and placed in the Aplysiomorpha. A good account is given of its swimming habits, with outline diagrams based on a film of the living animal taken by Mr. F. A. J. Armstrong, and Dr. D. P. Wilson adds beautiful photographs of this marine 'ballet dancer'. Dr. Morton also contributes a paper on the structure and ecology of the minute marine pulmonate, *Otina otis*. This limpet-like form lives in the barnacle zone, browsing on small algae, and breathes through the lateral lobes of the foot, for the pallial cavity is very narrow and not specialized for respiration. Few of the characters of *Otina* are specialized; but most, particularly those of the digestive, genital and nervous systems, are primitive.

Dr. R. B. Clark and Dr. A. Milne have worked on the sublittoral bottom fauna of two sandy bays on the Isle of Cumbrae, using the Robertson mud bucket. Their studies were chiefly on polychaetes, molluscs, echinoderms and crustaceans. Few species in this area are gregarious; random distribution is the general rule in the bottom community. Drs. L. R. Fisher, S. K. Kon and S. Y. Thompson contribute their third study of vitamin A and carotenoids in invertebrates, and are here dealing with eleven species of euphausiids. There is considerable variation in the amount of vitamin A stored in the eyes. One small-eyed species, *Thysanopoda acutifrons*, is peculiar in having none. Neritic groups of *Meganyctiphanes norvegica* have higher reserves than those from the open Atlantic; but the fat concentration is highest in northern waters. Astaxanthin is found in all. It is significant that, despite their similar habitat, the euphausiids are biochemically and morphologically distinct from the Mysidacea, and in both respects appear to be related to the Penaeidea. Euphausiids form a link in the food-chains leading to blue and fin whales, sperm and bottle-nosed whales (through decapod cephalopods), herring, cod (at certain times of the year) and halibut. Dr. J. S. Alexandrowicz as extended his study of the innervation of the eart in Crustacea to that of *Praunus*. The three stems of nerve elements—intrinsic neurones (six in *raunus*), a pair of nerves joining the local system o the central nervous system, and nerves to the rterial valves—are represented.

The salinity of Kames Bay sand, Isle of Cumbrae, ith special reference to the distribution of *Nereis iversicolor*, has been investigated by Dr. Ralph I. mith, of the University of California, Berkeley. He ound a zone of relatively stable brackish interstitial water, and the zonation of the polychaete corresponds o this belt of lowered salinity. Whether it prefers he lowered salinity, or whether other competitive ntertidal species shun it, is not yet clear; but Dr. Vera Fretter, working on the same species at Plymouth, shows that it can adjust itself gradually to he more dilute sea water and can maintain a steady tate indefinitely. This it does by taking up water nd losing salts. It achieves equilibrium in normal sea water, but is hypertonic in less salt water. Employing the tracer element sodium-24 obtained rom the Atomic Energy Research Establishment, Harwell, she found that in sea water of 35 per mille salinity, saturated with oxygen, at normal atmospheric pressure and a temperature of 14° C., the *Nereis* was in equilibrium, and the uptake of sodium averaged 250 mgm./hr./gm. wet weight. At half salinity, after accommodation to the dilution, the uptake averaged 160 mgm./hr./gm. wet weight, and at 9 per mille it was 180 mgm./hr./gm., there being an active uptake of salts in this last-named case against the concentration gradient. Oxygen deficiency and temperature changes also affect the rate of uptake of sodium. The integument of *Perinereis cultrifera* is more freely permeable to ions than that of *Nereis diversicolor*, the influx of sodium being about three times greater in normal sea water.

The number under review concludes with abstracts of memoirs recording work done at the Plymouth Laboratory of the Association and published in other journals.

N. B. EALES

# ISOTOPIC COMPOSITION OF METEORITIC HYDROGEN

By GEORGE EDWARDS

**Institute for Nuclear Studies, University of Chicago**

THE deuterium–protium ratio in meteorites is of interest because it is one of few known sources of information about the ratio of these isotopes in space near the time of formation of our planetary system. Their abundances in the sun's atmosphere are calculated from spectrographic measurements; but it is well known that at the sun's temperature deuterium is much more reactive in the nuclear process than hydrogen, and consequently there is extreme depletion of the deuterium as compared to the amount present in space.

The stony meteorites are too porous to retain a representative specimen of hydrogen gas, and if combined hydrogen is present it could rather easily be exchanged with hydrogen from water on the earth's surface after the fall. It appeared possible that hydrogen representative of that in planetary space might be retained in the carbonaceous chondrites (a small group of meteorites—twenty-one known, which contain varying amounts of free carbon and organic matter), and an investigation of the deuterium–protium ratio in this group of meteorites was carried out by G. Boato[1]. Previously, I. Friedman[2] conducted an isotopic analysis of an iron meteorite (Canyon Diablo); but stressed that some fractionation may have occurred during the process of outgassing the sample.

In 1953, I described[3] experiments on the isolation and determination of protium and deuterium in iron meteorites and presented results for two meteorites. Since then a number of other meteorites have been examined by the same method.

The metal is oxidized by heating to 1,100° C. in a stream of pure oxygen gas, the water from hydrogen in the meteorite being collected in a cold trap at −70° C. When the oxidation is complete, any carbon dioxide in the cold trap is pumped away. The temperature of the trap is raised, and the water vapour is passed over zinc granules at 400° C. to regenerate hydrogen. The apparatus is so arranged that any unreacted water may be recycled and complete reaction assured. The hydrogen is compressed with a Toepler pump and its volume measured before isotopic analysis.

To obtain oxygen of the necessary purity for the oxidation, it is passed over a mixture of copper oxide and palladium asbestos at 700° C., the oxidized products of hydrogen-containing compounds being adsorbed on active charcoal at −185° C.

The isotopic composition is measured with a 6-in. radius 60°-deflexion mass spectrometer of the double collector type similar to that described by Nier[4]. The instrument is equipped with two capillary leaks and with magnetically operated valves permitting rapid change-over of the sample and a standard gas (see McKinney *et al.*[5]). Results are expressed as differences, δD per cent, between the deuterium concentration in the sample and standard. The relation between this difference and the absolute ratio is expressed by the equation

$$\delta D \text{ per cent} = \frac{D/H \text{ sample} - D/H \text{ standard}}{D/H \text{ standard}} \times 100$$

and the standard gas is hydrogen of Lake Michigan water, the absolute ratio of deuterium to hydrogen, D/H, being approximately 1/6,500. Compared to this standard, average sea water is + 4·5 per cent. The error in analysis (including deviations introduced during the conversion of water to hydrogen) is ± 0·4 per cent maximum. The results of the analysis of a number of iron meteorites are shown in Table 1.

Meteorites were prepared for analysis as follows. With a diamond wheel in a dental drill apparatus, superficial rust was removed. Where sufficient rust was available, it was collected and the deuterium and protium determined in exactly the same way as for the meteorites. Final traces of rust were removed by sandblasting, after which the metal was washed with carbon tetrachloride. The meteorite was placed in a surface-grinding machine and dry-ground until no original surface metal remained and the specimen was rectangular in form. The meteorite was again washed in carbon tetrachloride and transferred with forceps to a shaping machine where the metal was cut to suitably sized swarf. All parts of the shaping machine around the meteorite were shrouded in

* Weighted average, see text

heavy aluminium foil which was previously washed with carbon tetrachloride. When about 10 gm. of metal had been cut, *all* cuttings were transferred to a clean bottle. If enough meteorite was available, the cutting process was repeated until a number of samples had been obtained.

During the cutting process, the turnings break into chips because of imperfections in the main body of the meteorite, and dark-coloured dust-like solid separates from the chips and falls to the bottom of the sample bottle. To obtain a representative sample of the whole meteorite it is necessary to collect the cuttings batch-wise as described, and to oxidize each sample as a whole.

In the case of Toluca, this was not done. All the cuttings were collected in a single bottle (26·9 gm.). The individual analyses of Toluca are shown in order in Table 1. The first two analyses are of 10-gm. lots of the turnings and the last analysis is of the 6·9-gm. residue in the sample bottle. It is apparent that the hydrogen is concentrated in the fine solid at the bottom of the same bottle. The difference in the deuterium analysis is not understood.

Table 2 shows the deuterium–protium analysis of surface rust from the meteorites from which a suitable sample was obtained.

It is clear that in general the hydrogen from the rust contains a distinctly higher proportion of deuterium than that in the metal. This, coupled with the fact that extreme care was taken to remove all rust—and, in fact, all superficial metal to an average depth of about 2 mm.—gives fair reason for believing the hydrogen from the samples to be that originally incorporated during the formation of the meteorites. It may be surmised that the hydrogen has been retained in the meteorite since it solidified and is representative of that in the parent body, at the time of solidification of the iron. It seems probable that the stony meteorites and irons were originally part of asteroids and that it was within such bodies that the separation of the phases occurred[6]. The age of two stony meteorites from recent argon–potassium measurements (Wasserburg and Hayden[7]) was found to be $4·7 \times 10^9$ years. This age is that of the solidification of the silicate, and it is probable that the iron also solidified about the same time, and that the hydrogen is of about this age. It is possibl that the irons are in two groups with hydroge contents of 0–10 and 25 p.p.m. (Table 1), althoug many more analyses would be necessary to establis this fully.

The amount of hydrogen found in irons is surprisingly high. The solubility of hydrogen at th melting point of iron is about 0·8 p.p.m. The hydrogen in the iron meteorites is therefore not simpl that in solution in the metal. It would appear tha the hydrogen is contained in solids which are presen in the minute irregular discontinuities throughout al the octahedrites examined. The experiments with Toluca meteorite suggest this. The substance i these discontinuities is thought to be sulphide an silicate not completely removed during the origina separation of the iron in the parent body, togethe with some carbides. It may be that this substanc also contains the large proportion of the uraniur found in iron meteorites by Prof. Paneth and hi co-workers[8]. Urey[9] has directed attention to the fac that the quantities of uranium found in the iron meteorites are distinctly higher than would be suggested from thermodynamic considerations of the distribution of uranium between metallic and oxide or silicate phases. Mr. O. Joensuu recently carried out spectrographic analysis of dust from fissures in Canyon Diablo meteorite, comparing this with metal chips from the same specimen. (The two can be separated moderately well by simply screening the whole sample of cut meteorite as it is obtained from the shaping machine.) He found 10 p.p.m. titanium in the metal and 300 p.p.m. in the fissure material. Uranium is not sufficiently abundant to permit spectrographic estimation, but would be expected to distribute itself between a metallic and oxide or sulphide phase in the same way as titanium[9].

In his study of deuterium in the carbonaceous chondrites, Boato[1b] attached special significance to the three results in which he found deuterium to be more than 25 per cent higher than in Lake Michigan water on the basis that such compositions lie outside the range of natural waters at present known. Since these experiments were made, a number of other facts have come to light which make this evidence less conclusive than was at first thought.

At the time of Dr. Boato's measurements, there was reason to believe that the carbonaceous chondrites might be the most primordial material of all the meteorites. Since then, Dr. Harold C. Urey and I have developed a method of measuring the concentration of certain minor elements in meteorites with a higher precision than was previously possible[10], and have estimated the sodium and potassium in carbonaceous and other chondrites. We have found a relatively great variation in the sodium and potassium in the carbonaceous chondrites. Dr. H. B. Wiik (private communication) has found this to be true for many other constituents also. We conclude that the carbonaceous chondrites have undergone chemical and/or thermal treatment at least as drastic

Table 2. DEUTERIUM CONCENTRATION IN HYDROGEN FROM RUST ON METEORITES

| Name | Hydrogen content (p.p.m.) | δD per cent |
|---|---|---|
| Arispe | 14,600 | − 13·9 |
| Coahuila | 5,300 | − 14·3 |
| Cranbourne | 11,500 | − 11·9 |
| Mount Joy | 19,700 | − 15·3 |
| Staunton | 12,400 | − 13·3 |
| Average | | − 13·7 |

| Indarch | 1·1 | 1·0 | − 10·7 |

s that involved in the production of any of the ther groups of meteorites, and that the carbonaceous hondrites have a much more complex history than ve would expect of truly primordial material. The nexpected variability in this group of meteorites eaves us in great doubt at the moment, not only bout the place but also the time of origin of these. Under these conditions it becomes difficult to attach pecial significance to specific results.

In the course of complete analysis of the carbonaceous chondrites, Dr. Wiik has determined the otal water content, and I am greatly indebted to im for permission to quote his results prior to ublication. As shown in Table 3, his values are onsistently higher than those found by Dr. Boato. The reason for the divergence is not understood. There may be some significance in the fact that the greatest fractional divergence in water contents is associated with the deuterium concentrations more than 25 per cent higher than that of Lake Michigan water and to which Dr. Boato attaches greatest significance. J. Godfrey[11] has recently observed that when water of hydrated silicates is incompletely extracted, the deuterium is concentrated in the extracted water and *not* in the silicate, as would be expected in a simple vaporization process. It appears possible, then, that the high deuterium values obtained in Dr. Boato's experiments might be wholly or partly due to incomplete extraction, though it is difficult to see how this could have occurred.

In view of the variable composition of the carbonaceous chondrites and the doubt regarding their history and origin, there does not seem to be any simple way of weighting the results. Seven of the ten results have deuterium concentrations ($\delta D$ per cent) grouped between − 13·0 and + 9·6 (average − 4·7 per cent), and the average of all the values is + 5·8 per cent with respect to Lake Michigan water (+ 1·3 per cent with respect to average sea water).

In these circumstances it appears that the deuterium–protium ratio found in the iron meteorites (− 8·4 per cent with respect to Lake Michigan water or − 12·9 per cent compared to average sea water) may be the most reliable available to us. The comparative consistency of the isotopic composition of hydrogen in the iron meteorites is suggestive of a common origin, different from that which gave rise to the surface rust. If we now suppose that the hydrogen of the iron meteorites is representative of that at or about the time of the earth's formation, then the present oceans are somewhat more abundant in deuterium than the primordial water. This is what we should expect if the earth had at some time lost all its original water except that remaining in hydrated silicates, and that the present oceans represent water evolved from these silicates. Incompleteness of this process of ocean formation would give water enriched in deuterium with respect to that in primordial water, as we indeed find.

I am indebted to Mrs. Jeanne Ingersoll for her assistance in all the practical work reported. My thanks are due also to Dr. Wiik for permission to use his results prior to publication, to Mr. O. Joensuu for spectrographic analysis, and to Prof. Harold C. Urey for useful discussions, advice and helpful criticism.

# CYTOCHROMES OF MICROSOMAL PARTICLES

## Cytochrome $b_5$ of Microsomes from Animal Tissues

A HÆMOCHROMOGEN, showing absorption bands at about 552 and 525 mμ, was observed in 1951 in microsomal particles from cow's milk[1,2]. As part of a general programme of investigation of the nature and properties of microsomal particles, this hæmochromogen has now been studied in greater detail in microsomes, isolated essentially as previously described[2,3], from the mammary gland and milk of the same cow and from calf intestinal mucosa.

Thick pastes of the buff-coloured microsomes from mammary gland and intestinal mucosa show no absorption bands in the visible region when observed with a low-dispersion micro-spectroscope. After reduction with sodium dithionite, strong absorption bands appear in both preparations at about 560 and 525 mμ, as measured with a Hartridge reversion spectroscope. The pink-coloured microsomes as isolated from milk[2] show weak absorption bands in approximately the same positions, and these are only slightly intensified on addition of sodium dithionite. The lower readings previously reported[1,2] for the α-band may have been due to the presence of some adsorbed cytochrome *c* in the original preparation of milk microsomes.

The identity of the pyridine-hæmochromogen of the microsomal pigment with that formed from pure protohæm indicates that protohæm is the prosthetic group. This observation, together with the similarity in the positions of the visible absorption bands with those of cytochromes *b*, $b_1$ and $b_2$, which were simultaneously being studied in this laboratory, led us in 1953 to designate the microsomal hæmochromogen as cytochrome $b_5$[4]. (The normal sequence in the nomenclature of cytochromes of the *b* group was interrupted when the term 'cytochrome $b_4$' was given to a bacterial pigment[5] which appears to be

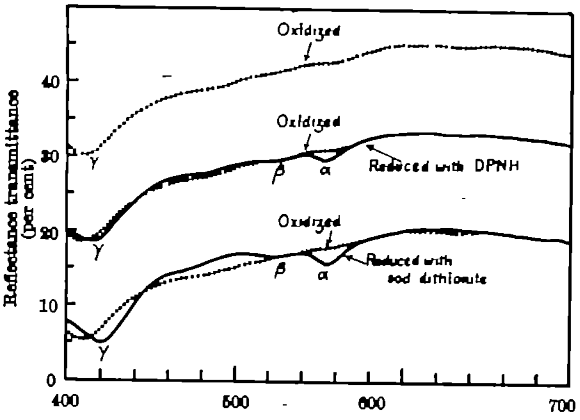

Fig. 1. Absorption spectrum of reflected light from a thick paste of microsomes from mammary gland

more closely related to cytochrome $c$ than to cytochrome $b$. A component of plant chloroplasts has now been described as cytochrome $b_6$ [6].)

Using a specially designed recording spectrophotometer, Dr. F. Moss and Dr. R. G. Giovanelli kindly analysed the spectrum of the reflected light from mammary gland microsomes, as shown in Fig. 1. The bands of cytochrome $b_5$ appear as follows: oxidized, general absorption about 555 mμ and Soret at 412 mμ; reduced, 557 mμ (α), 526 mμ (β) and 421 mμ (γ or Soret).

In 1951 Kun[7] isolated from rat liver a pigment closely resembling cytochrome $b_5$ in absorption spectrum and showed that it was partly reduced by reduced coenzymes I and II (reduced di- and triphosphopyridine nucleotide). The relationship of cytochrome $b_5$ to the oxidases of these coenzymes and to their cytochrome $c$ reductase activities of microsomes was therefore examined.

When about 0·5 μmole of reduced coenzyme I or II is added to about 0·5 ml. of a thick suspension of mammary gland or intestinal microsomes, the α- and β-bands of reduced cytochrome $b_5$ immediately appear. They rapidly disappear in the presence of air due to oxidation, but reappear on addition of further substrate. The process may be repeated several times. If oxygen is excluded from the system, the cytochrome remains reduced. Fig. 1 shows that, under aerobic conditions, cytochrome $b_5$ is only partly reduced by excess reduced coenzyme I, thus indicating the rapid oxidation of the reduced cytochrome by oxygen, possibly due to enzymic catalysis. Oxidation of reduced cytochrome $b_5$ is not inhibited by potassium cyanide ($10^{-3}$ $M$).

The addition of oxidized cytochrome $c$ to microsomes reduced with reduced coenzyme I causes an immediate reduction of the cytochrome $c$. Thus reduced cytochrome $b_5$ reacts, directly or indirectly, with either cytochrome $c$ or oxygen. Table 1 shows that the reduced coenzyme I–cytochrome $c$ reductase activity of milk, mammary gland and intestinal microsomes is closely related to the concentration of cytochrome $b_5$. Incubation of microsomes from mammary gland in milk serum at 38° for 10 hr. causes a marked fall in the reductase activity to that typical of the microsomes from milk. There appears to be a corresponding decline in the cytochrome $b_5$ concentration. The rates of reactions with reduced coenzymes I and II as substrates are substantially the same in intestinal, and presumably also in gland, microsomes. As shown in Table 2, the reduced coenzyme I–cytochrome $c$ reductase activity of microsomes is only slightly inhibited by antimycin $A$.

Intestinal microsomes show a significant cytochrome $c$ oxidase activity which is almost completely inhibited by $10^{-3}$ $M$ potassium cyanide (Table 2). The dithionite-reduced microsomes show a very weak absorption band at approximately 604 mμ, presumably due to cytochromes $a + a_3$, but they have almost negligible succinic dehydrogenase activity. The presence of cytochrome $c$ oxidase implies a cyanide-sensitive reduced coenzyme I–oxidase system. However, no cytochrome $c$ could be detected spectroscopically in either mammary gland or intestinal microsomes. The cyanide-resistant cytochrome $b_5$ oxidase system may provide an alternative pathway from the cytochrome $c$ oxidase, leading to production of energy for synthetic processes catalysed by microsomes.

These results indicate that cytochrome $b_5$ is intimately associated with the reduced coenzyme I (and II)–cytochrome $c$ reductase and reduced coenzyme I (and II)–oxidase activities of microsomes. In this laboratory it has already been shown that crystalline cytochrome $b_2$ from yeast is a flavohæmoprotein having lactic dehydrogenase activity[8]. Cytochrome $b_5$ appears to bear a similar relationship to reduced coenzyme I (and II)–cytochrome $c$ reductase as cytochrome $b_2$ bears to yeast lactic dehydrogenase (lactic-cytochrome $c$ reductase) activity. It is very probable that a flavin or similar moiety mediates the reduction of the hæm of cytochrome $b_5$ by the substrate, as in the case of cyto-

Table 1. COMPARATIVE PROPERTIES OF MICROSOMES FROM INTESTINAL MUCOSA, MAMMARY GLAND AND MILK

| Source of microsomes | DPNH–Cyt. $c$ reductase activity | Cytochrome $b_5$ concentration | Reductase activity / Cyt. $b_5$ concentration |
|---|---|---|---|
| Intestine | 98 | 3·7 | 26 |
| Mammary gland | 53 | 1·8 | 29 |
| Milk | 0·9 | Less than 0·05 | — |

Reductase activities, determined as for Table 2, are expressed as μmoles of cytochrome $c$ reduced/hr./mgm. total nitrogen. Cytochrome $b_5$ concentration is expressed as μmoles hæm/gm. total nitrogen. This was estimated by matching the α-band of the reduced compound with that of a standard preparation of globin hæmochromogen, using a molecular extinction coefficient of $30 \times 10^3$ for the reduced compound.

Table 2. ENZYMIC ACTIVITIES OF MICROSOMES FROM COW MAMMARY GLAND AND CALF INTESTINAL MUCOSA

| Source of microsomes | Substrate | Acceptor | Activity | | |
|---|---|---|---|---|---|
| | | | Control | With antimycin $A$ | With pot. cyanide |
| Cow mammary gland | DPNH | oxidized cyt. $c$ | 26·3 | 23·6 | — |
| Calf intestine mucosa | DPNH | oxidized cyt. $c$ | 49·2 | 40·0 | — |
| | TPNH | oxidized cyt. $c$ | 28·7 | 24·2 | — |
| | Reduced cyt. $c$ | oxygen (air) | 6·7 | — | 0 |
| | DPNH | oxygen (air) | 0·7 | — | 0·6 |

Activities, which were estimated spectrophotometrically, are expressed as μmoles substrate utilized/hour/mgm. nitrogen, assuming that 2 moles of reduced cytochrome $c$ are equivalent to 1 mole of reduced diphosphopyridine nucleotide. For determining reductase activities, the final concentrations of reactants were: oxidized cytochrome $c$, $5 \times 10^{-5}$ $M$; DPNH (or TPNH) approx. $3 \times 10^{-4}$ $M$; potassium phosphate buffer, $5 \times 10^{-2}$ $M$, pH 7·4; potassium cyanide, $10^{-3}$ $M$; and antimycin $A$ (where added), 3 μgm./ml. For determining oxidase activities they were: reduced cytochrome $c$, $5 \times 10^{-5}$ $M$, or DPNH, $1 \times 10^{-4}$ $M$; potassium phosphate buffer, $5 \times 10^{-2}$ $M$, pH 7·4; and potassium cyanide (where added), $10^{-3}$ $M$.

hrome $b_5$. This is seen from Fig. 1, which shows hat reduced coenzyme I and sodium dithionite both ause reduction of a component absorbing in the egion of 460–480 mμ in the oxidized state, presumbly a flavin group. Further work is being carried ut to establish whether this and the hæm group are n different proteins or attached to the one protein, s in the case of cytochrome $b_2$ [3].

Cytochrome $b_5$ of cow mammary gland and calf ntestinal mucosa appears to be very similar to, if not dentical with, a cytochrome in liver described by Kun[7], alled cytochrome $b'$ by Yoshikawa[9] and cytochrome m by Strittmatter and Ball[10,11], who recognized its nicrosomal localization. The name 'cytochrome $b_5$' as independently been given to this liver hæmohromogen[12] as well as to a similar pigment in the nidgut of *Cecropia* larvæ[13]. The recent publication f the latter papers[11–13] has prompted us to make n early report of our independent investigations. Whether the cytochrome $b_5$ components of cow nammary gland, calf intestine, *Cecropia* midgut and at liver are identical can only be established by urification studies. The microsomal-bound alkaline hosphatases of cow mammary gland and calf ntestinal mucosa, for example, have similar enzymic pecificity and action but are, in fact, different proteins[1,14].

## Cytochrome $b_3$ of Microsomes from Plant Tissues

THE microsomal fraction isolated by differential centrifuging from homogenates of white petiole of silver beet (*Beta vulgaris*) appears as a yellow-coloured pellet, as distinct from the buff-coloured mitochondrial fraction. When examined with a low-dispersion micro-spectroscope, the microsome pellet shows a broad absorption band in the blue (485–500 mμ) but no other bands in the visible region. However, after reduction with sodium dithionite, strong absorption bands appear at 560 and approximately 525 mμ, as measured with a Hartridge reversion micro-spectroscope. The α-band (560 mμ) is very sharp but shows an intensification toward the red end, suggesting an asymmetrical absorption band. The band at 485–500 mμ does not change on dithionite treatment. Microsomes isolated from onion bulb and from the spadix of *Arum* species show essentially the same absorption spectrum.

The absorption bands of the reduced compound are close to those of cytochromes $b$, $b_1$ and $b_5$. Moreover, the pyridine hæmochromogen of the microsomal pigment appears to be identical with that from pure protohæm, suggesting that protohæm is the prosthetic group. These facts indicate that the microsomal pigment is a cytochrome of the $b$ group. Table 1 compares the properties of this cytochrome with those previously described for cytochrome $b_3$, a pigment recognized in plant tissues by Hill and Scarisbrick[1]. There is reasonable agreement in properties, and therefore the microsomal cytochrome is referred to as cytochrome $b_3$. While it appears that microsomal cytochrome $b_3$ is very similar to the cytochrome $b_3$ of Hill and Scarisbrick, identity can only be established by purification studies.

Table 1. PROPERTIES OF CYTOCHROME $b_3$

| | Cytochrome $b_3$ of Hill and Scarisbrick (ref. 1) | Cytochrome $b_3$ of microsomes |
|---|---|---|
| Source | 'Soluble' extracts of growing tips of broad bean, cotyledons of broad bean and potato tubers | Microsome fraction sedimented from homogenates of petiole of silver beet, onion apical stem and spadix of *Arum* species |
| Absorption bands of reduced compound | 558·6 mμ to 559·7 mμ (α-band) 529·3 (β-band) (Soret band not determined) | 559·5 mμ (α-band) approx. 525 mμ (β-band) 425 mμ (Soret band) |
| Reaction of reduced compound with air | Autoxidizable | Rapidly oxidized |
| Effect of carbon monoxide | Does not combine with reduced compound | Does not combine with reduced compound |
| Absorption bands of pyridine hæmochromogen | | Broad bands at about 557 mμ (α) and 530 mμ (β) |
| Effect of ethanol and acetone at room temperature | Rapidly denatured | Slowly destroyed |

Cytochrome $b_3$ of silver beet petiole and onion bulb is localized entirely in the microsome fraction. It represents about 10 per cent of the total hæm compounds of the petiole homogenate. Petiole microsomes contain about 1·5 μmoles hæm per gm. nitrogen. No detectable amount of cytochrome $b_3$ occurs either in the mitochondria or in the supernatant remaining after centrifuging beet or onion homogenates at 50,000 $g$ for 1–2 hr. In contrast, Hill and Scarisbrick[1] found cytochrome $b_3$ in solution in extracts of leaves of broad beans and other plants. Since these workers held the tissue dispersions for about twelve hours at room temperature in order to clarify them, it is probable that the cytochrome was released from the microsomes by autolysis. Autolysis liberates other bound enzymes, such as alkaline phosphatase, for example, from microsomes of animal tissues[2]. Moreover, when a preparation from silver beet leaf and petiole was treated as described by Hill and Scarisbrick[1], the fraction obtained between 50 and 100 per cent saturation with ammonium sulphate contained both cytochromes $c$ and $b_3$. Neither of these cytochromes occurs in solution in dispersions of fresh tissue.

The spectrum of the reflected light from a pellet of microsomes from silver beet petiole was kindly determined by Dr. F. Moss and Dr. R. G. Giovanelli, using a special recording spectrophotometer, and is shown as Fig. 1. When reduced with dithionite, maxima appear at 676, 560, 482, 444 and 425 mμ. It is considered that the peaks at 560 (α) and 425 mμ (γ or Soret) are those of cytochrome $b_3$, the β-band (at approximately 525 mμ) not being detected. The

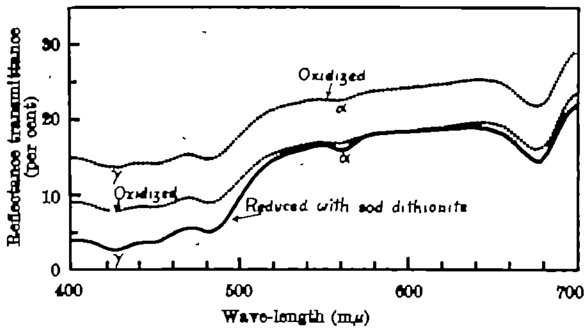

Fig. 1. Absorption spectrum of reflected light from a thick paste of microsomes from beet petiole. The preparation contained a small residual amount of cysteine (from the dispersion medium). This caused partial reduction as shown in the 'oxidized' curve. Addition of reduced coenzyme I caused no significant change in the absorption spectrum

peak at 444 mμ is possibly the Soret band of cytochrome $a_3$, especially since some preparations of beet microsomes in the reduced state show a very weak band at about 605 mμ (probably due to cytochromes $a$ and $a_3$). The broad band with a peak at 482 mμ is that referred to previously as observed spectroscopically. The nature of the compound giving rise to this peak is not known. The band at 676 mμ may be due to slight contamination of the preparation with chlorophyll. Silver beet microsomes show no detectable peroxidase activity.

In view of the marked cytochrome $c$ reductase activity of the plant microsomes with reduced coenzyme I (DPNH) and reduced coenzyme II (TPNH) as substrates, it seemed possible that reduced coenzyme I might reduce cytochrome $b_3$. Under aerobic conditions, addition of quite large amounts of reduced coenzyme I to the microsomal pellet caused no appreciable reduction of cytochrome $b_3$. However, when either reduced coenzyme I or II was added under strictly anaerobic conditions, there was rapid, and apparently complete, reduction of cytochrome $b_3$. The bands of the cytochrome disappeared immediately on exposure to air.

The very rapid rate of oxidation of reduced cytochrome $b_3$ by air suggests that this is unlikely to be due merely to autoxidation, but that the reaction may be enzymically catalysed by a cytochrome $b_3$ oxidase.

The microsomes contain no detectable amount of cytochrome $c$. However, when heart muscle cytochrome $c$ is added to the microsome suspension followed by reduced coenzyme I, the bands of reduced cytochrome $c$ rapidly appear. This occurs under aerobic conditions. These observations suggest that cytochrome $b_3$ may be related to the reduced coenzyme I and II cytochrome $c$ reductase and to the reduced coenzyme I and II oxidase activities of plant microsomes.

Hill and Scarisbrick[1] observed that cytochrome $b_3$ of leaves was reduced in light and oxidized in the dark. Since there is accumulating evidence that coenzymes I (and II) are reduced by plant chloroplasts in the presence of light[2], this observation is consistent with the finding that reduced coenzymes I and II are substrates of cytochrome $b_3$. Cytochrome $b_3$ of plant microsomes thus appears to be the analogous hæmochromogen to cytochrome $b_5$ of microsomes from animal tissues[4]. Moreover, the ratio of the reduced coenzyme I cytochrome $c$ reductase activity (about 26 μmoles cytochrome $c$ reduced/hr./mgm. nitrogen) to the concentration of cytochrome $b_3$ (approximately 1·5 μmoles hæm/gm. nitrogen) is 17, and thus of a similar order to the ratio of the reductase activity to the cytochrome $b_5$ concentration in animal microsomes[4]. As in the case of cytochrome $b_5$, it seems likely that a flavin or similar moiety may mediate the reduction of the hæm group of cytochrome $b_3$ by reduced coenzyme I. It is hoped to establish this by purification studies, particularly as it has been found in this laboratory that yeast cytochrome $b_2$ is a flavohæmoprotein[5].

Antimycin *A*, a powerful inhibitor of reduced coenzyme I cytochrome $c$ reductase activity in animal tissues[6], fails to inhibit this activity in microsomes from silver beet petiole, as shown in Table 2. Table 2 also indicates that the cytochrome $c$ reductase activity of beet microsomes is substantially the same with either reduced coenzyme I or II.

Table 2. REDUCTASE AND OXIDASE ACTIVITIES OF MICROSOMES FROM THE PETIOLE OF SILVER BEET

| Exp. | Fraction | Enzymic activity | | |
|---|---|---|---|---|
| 1 | Microsomes | DPNH–cyt. $c$ reductase | Control | 13 |
| | | | Antimycin *A* | 14 |
| | Mitochondria | DPNH–cyt. $c$ reductase | Control | 4 5 |
| 2 | Microsomes | DPNH–cyt. $c$ reductase | Control | 10 |
| | | TPNH–cyt. $c$ reductase | Control | 18 |
| | | | Antimycin *A* | 14 |
| 3 | Microsomes | DPNH–cyt. $c$ reductase | Control | 11 |
| | | DPNH–oxidase | Control | 8·0 |
| | | | Cyanide | 8·5 |
| | | TPNH–oxidase | Control | 11 |
| | | | Cyanide | 11 |

Activities, which were estimated spectrophotometrically, are expressed as μmoles substrate utilized/hr./mgm. nitrogen, assuming 2 moles of reduced cytochrome $c$ are equivalent to 1 mole of reduced coenzyme I. For determining reductase activities (at 550 mμ) the final concentrations of reactants were: oxidized cytochrome $c$, 5 × $10^{-5}$ *M*; reduced coenzyme I (or II), 3 × $10^{-4}$ *M*; phosphate buffer, 0 07 *M*, *p*H 7 4; potassium cyanide (where added), $10^{-3}$ *M*; and antimycin *A* (where added), 6 μgm./ml. For determining oxidase activities (at 340 mμ) the same concentrations of reactants were used, omitting cytochrome $c$.

Microsomes from silver beet show only slight cytochrome $c$ oxidase activity, and the reduced coenzyme I oxidase is not inhibited by potassium cyanide (Table 2). The microsomes thus could provide an antimycin *A*-resistant cyanide-resistant pathway for oxidation of reduced coenzyme I (and II). It is possible that this pathway may provide energy for the synthetic processes catalysed by microsomes. Certain plant tissues are known to have a cyanide-resistant 'basal' respiration, as well as a cyanide-sensitive 'salt-linked' respiration[7]. It may well be that microsomal cytochrome $b_3$ and the associated reduced coenzyme I oxidase system are involved in the pathway for 'basal' respiration in such tissues. The spadix of *Arum* species, in particular, has a very active cyanide-resistant respiration[8]. Preliminary examination indicates that this tissue has quite a high concentration of cytochrome $b_3$. Further studies on the relation of cytochrome $b_3$ to plant respiration are in progress.

## Genetical Effects of Radiation from Products of Nuclear Explosions

SIR JOHN COCKCROFT[1] has given a reassuring answer to the question of the genetic hazards of radiation from the products of nuclear and thermonuclear explosions disseminated to large distances. I think that he, or his biological advisers, have greatly over-estimated the simplicity of the problem. It can be attacked by several different methods. First we can fix a rough upper bound to the effect.

If an average human being has received 3 roentgens before becoming a parent, then a mean extra dose of $x$ roentgens spread over the world's population will increase the number of mutations arising in the next generation as the results of radiation by $\frac{1}{3}x$, provided $x$ is small.

In *Drosophila melanogaster* almost all mutations arise by a process with a temperature coefficient, and therefore presumably chemical. Isotopically labelled atoms are rarely incorporated into deoxyribonucleic acid except when it is replicated. This mutational process therefore probably occurs only or mainly during gene replication. Man has about twice as many nuclear replications per life-cycle as *Drosophila*, and a somewhat higher temperature. The chemical component in human mutation is therefore likely to be of the order of ten times that of *Drosophila* per generation. On the other hand, a human generation is about 1,000 times longer than a *Drosophila melanogaster* generation, so the component due to radiation may be expected to be about 1,000 times greater in man than in *Drosophila*. Man may have become adapted to longer generations by reducing mutation-rates; but he may also have a larger number of mutable genes. On the basis of such arguments, I suggested[2] that "it is quite possible that radiation may account for most human mutation". If so, the dose of radiation needed to double the human mutation-rates is a little more than 3 r. per generation, and not 50 r. as Cockcroft suggests. In fact, the effect of radiation is about ten times as serious as he believes.

It is also more serious for another reason. Cockcroft points out that since most British people spend most of their time indoors, the effective dose of radiation received by them is reduced to about a tenth of the outdoor dose. However, about half the human race is engaged in outdoor work, and most of the population in such countries as India live in very flimsy houses. Allowance for this fact raises the expected effect by a factor of two or three.

We do not know how much of human mortality is due to the action of natural selection in eliminating mutant genes. Haldane's[3] suggested figure of 10 per cent may be a good deal too high. But if this figure were accepted, an average dosage for the world of 0·01 r. (corresponding to Cockcroft's figure of 0·003 r. for Britain) could be responsible for about one three-thousandth of the $10^9$ or so deaths which occur in a generation, say, 300,000 deaths transferred from the ages later than the mean age of parenthood to the ages before it.

This figure is probably an upper bound. We can obtain an approximate lower bound as follows. Suppose men to have no more radiosensitive genes than *Drosophila*, as against the usual estimate of five to ten times as many, then we expect one lethal and two to four sublethal mutations per 10,000 r. The latter, which cause invalidism and death after some years of life, are the more serious. If they are all fully recessive, which again is optimistic, this implies about 2 deaths per 10,000 r., or about 2,000 deaths from the $10^7$ r. received by a generation of $10^9$ people receiving 0·01 r. on an average.

The true number is probably somewhere between 2,000 and 300,000. I doubt whether the experiments carried out on mice up to now allow of any great precision. Those whose results have so far been published were not so designed as to allow a calculation of the rate of production of lethal mutations; and had they been so designed, the argument from mice to men is of dubious validity. It may be possible to validate this argument by experiments on human and mouse tissue cultures.

The problem is not insoluble. The figures given above could, I think, be improved. I have, however, deliberately used estimates made before the question of the genetic effects of experimental explosions was raised. Estimates made later may have been influenced by conscious or unconscious political or ethical bias. Research on this problem requires extremely careful planning, including the realization that apparently hopeful projects may prove useless.

Until the results of such research have been published, many biologists will find it hard to share Sir John Cockcroft's optimism.

---

IN my lecture to the Parliamentary and Scientific Committee, I said that the Oak Ridge experiments suggested a doubling dose of about 50 r. for mice, but that the extrapolation to men was obviously an uncertain one. Dr. H. J. Müller has used a figure of 80 r. with similar qualifications.

I also emphasized the uncertainty of the biological data and the need for long-term genetic studies.

Since a Committee of the Medical Research Council has been appointed to study these problems, I will not pursue the matter further.

## Insulin Activity of Cord Plasma

IT has been shown by histological methods[1] that the islets of Langerhans form a much larger proportion of the pancreatic tissue in fœtuses and newborn infants than they do in adults, and Fisher and Scott[2] extracted relatively more insulin from the pancreas of the fœtal and newborn calf than from the same organ in later life. Hartmann and Jaudon[3] found that the injection of insulin into newborn human infants led to a moderate fall of blood sugar, and Villee[4] has stated that the fœtal tissues of man respond *in vitro*, like those of adults, to the presence of added insulin by an increased utilization and oxidation of glucose. The newborn infant, therefore, would appear to have abundant islet tissue and to respond normally to insulin; and in keeping with all this is the well-known fact that newborn infants may have very low fasting blood-sugars[5].

Newborn rats and cats, however, and fœtal dogs, sheep and goats have been shown to exhibit relatively little fall in blood sugar and to survive doses of insulin which were many times those lethal for adults of the same species[6]. An insulin inhibitor was invoked to explain this. The difficulty of reconciling these seemingly contradictory findings led us to make a new approach and to try to obtain further evidence by an altogether different method.

We have accordingly compared directly the insulin activity of cord plasma, and maternal plasma withdrawn at the same time, by a method based upon the glucose uptake of the isolated rat diaphragm[7,8]. The procedure described by one of us (P. J. R.) was followed exactly[8]. Five mothers and infants were investigated, and they were all clinically normal; the results are given in Table 1. Maternal plasma, like the plasma of adult people not recently pregnant, exhibited highly significant insulin activity. No insulin activity could be detected in the cord plasma, and this difference between cord and maternal plasma was highly significant.

Table 1. INFLUENCE OF CORD AND MATERNAL PLASMA UPON THE GLUCOSE UPTAKE OF THE ISOLATED RAT DIAPHRAGM

| Incubation medium | No. of patients | Glucose uptake (mgm. glucose/gm. of wet diaphragm/hr.) Mean ± S.E. of mean |
|---|---|---|
| Buffer | – | (a) 2·43 ± 0·13 (27) |
| Buffer + cord plasma (25 per cent plasma) | 5 | (b) 2·30 ± 0·11 (28) |
| Buffer + maternal plasma (25 per cent plasma) | 5 | (c) 2·99 ± 0·11 (28) |

$t$ for (a) v. (b) is 0·80, whence $P > 0·50$
$t$ for (a) v. (c) is 3·62, whence $P < 0·001$
$t$ for (b) v. (c) is 4·60, whence $P < 0·001$

Figures in parentheses are total number of hemidiaphragms. Samples of cord and maternal plasma taken at the same time.

It has yet to be shown unequivocally that the rat diaphragm technique detects only insulin in plasma[9]. Nevertheless, these results suggest the possibility that the cord plasma contained less insulin than the maternal plasma. If that be the case, it looks as though the islets, although numerous, are not secreting enough insulin before birth to sustain a level of plasma insulin comparable to that found in the mother.

## Deoxyribonucleic Acid Content of Nuclei in Tail Mesenchyme of *Rana pipiens* Tadpoles

LINDAHL[1] has suggested the occurrence of reduction division of chromosomes in the micromeres of the 16-cell stage in the embryos of two species of sea-urchins. This interpretation was based on the observation of haploid chromosome counts in anaphases and early telophases, while metaphase counts showed diploid numbers. Afterwards one of us[2] reported haploid counts from mesenchyme cells of the tail in *Rana pipiens* tadpoles. These were observed in whole mounts of stained tail tips, and occurred in stages resembling prometaphases. Other evidence, however, fails to support the suggestion of somatic reduction in the mesenchyme cells of these forms. Makino and Alfert[3] failed to find haploid numbers in micromere divisions of the sea urchin *Strongylocentrotus purpuratus*, from California; while the cytophotometric measurements of deoxyribonucleic acid in developmental stages of the sea urchin *Lytechinus* made by McMaster[4] do not reveal reduction of chromatin in the micromeres or their derivatives. In *Rana pipiens*, the cytophotometric deoxyribonucleic acid measurements of Moore[5] show the normal diploid chromatin condition in mesodermal elements.

Another possible explanation of the cytological findings of haploidy is suggested by the recent observations of Boss[6]. In cultured cells of the newt, pairing of chromosomes takes place during the anaphase movement, giving rise to apparently haploid anaphase groups.

In order to determine whether the amount of deoxyribonucleic acid per cell in the tail mesenchyme corresponds to a haploid or a diploid condition, material comparable to that examined by Green[2] has been studied by cytophotometric measurement of Feulgen-stained interphase nuclei. Material for measurement of the Feulgen reaction was prepared by the technique of freezing substitution[7]; tail tips were frozen at – 78° C. in ethyl alcohol, and substituted with the same solvent at – 30° C. After post-fixation at 60° C. in 95 per cent ethyl alcohol, the whole tips were stained with the Feulgen reaction, using 12-min. hydrolysis in $N$ hydrochloric acid at 60° C. After bleaching and rinsing in water, the tips were softened in 25 per cent acetic acid, and squashed under siliconed coverslips. The coverslips were removed from the preparations by the technique of Rudkin *et al.*[8]. After clearing in xylol, the preparations were mounted in oil of closely matching refractive index (R. P. Cargille Co., N.Y.) as determined by minimal dark-field scatter.

In preparations of this type, the interphase nuclei are greatly flattened, and circular to elliptical in outline. Light absorption by the dye was measured by use of a cytophotometer similar to that described by Pollister[9]. The amount of dye per nucleus was calculated as the product of the extinction at 546 mμ and the area of the nucleus in square microns (total extinction). Absorption measurements were made of a 'plug' just smaller than the smaller whole axis of the nucleus; the area was computed from the two axes measured in the image plane. The distribution of absorbing material in preparations of this type is sufficiently uniform to ensure that errors due to this cause are small, as determined by use of a photographic scanning technique[9]. Since high extinction values were encountered, glare error was minimized by illumination of an area of minimal diameter in

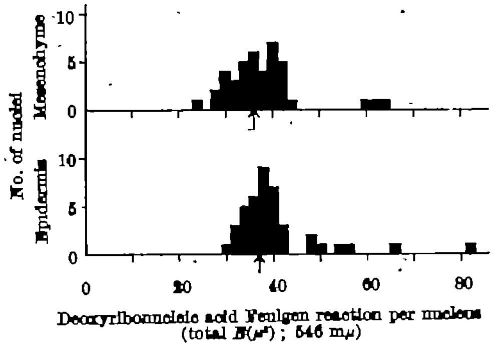

Fig. 1. Arrows indicate means at 35·74 (above) and 36·95 (below)

he plane of the object (10 per cent greater than the aximum plug size). Experiments with opaque bjects of appropriate size indicated a maximum lare intensity 1 per cent of the incident intensity n the image plane.

The frequency distributions of deoxyribonucleic cid contents for groups of mesenchyme and epi- ermal nuclei are shown in Fig. 1. The means of the wo populations do not differ significantly. Scattered alues with high deoxyribonucleic acid content are onsidered to arise from cells in which synthesis of eoxyribonucleic acid is occurring prior to mitosis. he apparent concentration of deoxyribonucleic acid n the mesenchyme nuclei is, however, markedly igher than in the epidermal nuclei. As may be seen rom Fig. 2, the relation between concentration extinction) and area in the squashed cells falls along he calculated curve $E.A = k$, where $k$ is the observed ean total extinction. Scattered values above the urve approach $E.A = 2k$ as a limit. Thus the ifference in staining of nuclei of the two types of ell is to be accounted for purely on the basis of the ilution of a constant amount of deoxyribonucleic cid.

Cytological examination of squash preparations hows epidermal metaphase figures that are large and well spread, and that yield the diploid number of hromosomes, namely, 26. Metaphase and anaphase figures from the mesoderm are small and tend to remain clumped. No anaphase counts have been feasible. Metaphase plates which it has been possible to analyse show 26 chromosomes. Occasional mesodermal figures of intermediate size show a tendency to somatic pairing.

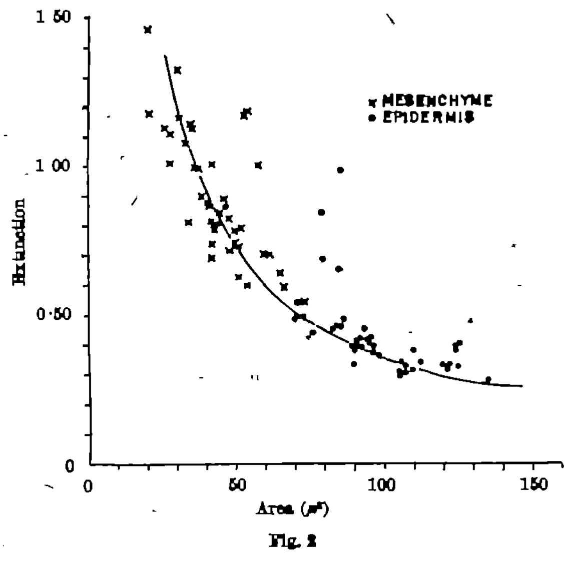

Fig. 2

The appearance of haploidy in the 'prometaphases' in whole mounts must be regarded as a transient phenomenon, rather than as evidence of somatic reduction. Since anaphases here also show haploid counts[9], it is possible that pairing of the type observed by Boss occurs. It should be noted that instances of homologous synaptic pairing in prophase have been described by Duryee and Doherty[10] in cultured kidney and adenocarcinoma cells of *Rana pipiens*. A paired orientation of the chromosomes persisting through the interphase may account for an apparent haploidy in the prophase stages of the succeeding division.

This work was supported by a research grant (C1613) to Dr. Jack Schultz from the National Cancer Institute of the National Institutes of Health, Public Health Service, and by an institutional grant from the American Cancer Society. We would like to acknowledge the help of Constance B. Herdeck in making the cytological preparations.

## A Source of Ammonia and Changes of Protein Structure in the Rat Brain during Physical Exertion

WE have already shown that functional activity of the brain associated with diffuse neuromuscular activity (physical exertion by swimming) influences numerous biochemical processes in the brain. Certain metabolic processes in the brain are probably used for meeting the energy requirements of the nervous tissue during increased functional activity of the brain connected with the carrying out of physical exertion. This is shown by the fall of the actual concentration of glycogen, glucose and lactic acid in the brain[1]. Since, during increased functional activity of the brain, an increased amount of ammonia is produced, which is toxic to the nervous tissue, processes of detoxication of ammonia bound by free glutamic acid to free glutamine occur in the brain[2]. An extensive literature shows that functional activity and various modes of excitement of nervous tissue are always connected with the formation of ammonia[3]. The sources of ammonia, and the biochemical and physiological significance of the process of ammonia formation in nervous tissue during functional activity, however, have not been definitely established. The present investigation was undertaken to contribute to the clarification of this question.

Seventy-two rats weighing 150–200 gm., in six experimental series, were used. Each series contained

Table 1. Influence of Physical Exertion on Concentration of Amido-Nitrogen in the Protein Fraction of Rat Brain. (Each figure represents the average of six brains. Results are given in µmole/gm. fresh weight)

| Series | Normal | After 4½ hr. swimming | Difference |
|---|---|---|---|
| 1 | 92·4 | 89·0 | − 3·4 |
| 2 | 92·7 | 81·7 | −11·0 |
| 3 | 106·9 | 98·2 | − 8·7 |
| 4 | 82·9 | 75·8 | − 7·1 |
| 5 | 92·2 | 87·4 | − 4·8 |
| 6 | 104·9 | 99·9 | − 5·0 |
|  | 95·3 | 88·7 | − 6·6 ± 1·2 |

$P < 0 \cdot 01$

twelve rats of approximately the same weight and age, which were divided into two groups of six animals each. One group swam for 4½ hr., under conditions previously described[1,2]. Swimming served as a model of diffuse neuromuscular activity. After cessation of swimming, the rats were thrown into liquid air and frozen *in vivo*. The frozen brains were taken out, homogenized at low temperature by crushing into fine powder and put into a weighed flask containing 100 ml. of 12 per cent trichloracetic acid. All six brains of animals from one experimental group were put in a single flask. The brains of the control animals were put in a second flask. The fresh weight of the brains was established by differential weighing.

The brain tissue was extracted twice with trichloracetic acid, then with water, and afterwards the extraction of lipids followed, which was carried out successively with 30 volumes of acetone and then alcohol–ether mixture (3 : 1 v./v.) and chloroform–methanol mixture (2 : 1 v./v.), on a water-bath under reflux. The brain tissue, freed of the acid-soluble fraction and lipids, was hydrolysed for 24 hr. with 30 vol. of 20 per cent hydrochloric acid[4]. In the hydrolysate, the total nitrogen and amido-nitrogen of the protein fraction in the brain were determined by Dawson's method[4] with small modifications. From Table 1 it can be seen that in each experimental series the concentration of amido-nitrogen in the protein fraction of rat brain is always lower in the group of rats that swam. The average decrease of amido-nitrogen is $-6 \cdot 6 \pm 1 \cdot 2$ µmole/gm. ($P < 0 \cdot 01$).

This decrease of amido-nitrogen in the protein fraction of the brain is specific; that is, it is not caused by general degradation of brain proteins, since we did not observe in the protein fraction of the brain any statistically significant changes of the Kjeldahl-nitrogen during the physiological process described. In accordance with this, we observed a statistically significant increase of the ratio of Kjeldahl-nitrogen to amido-nitrogen in the protein fraction of rat brain. Whereas the normal ratio of Kjeldahl-nitrogen to amido-nitrogen is 10·80 (average for thirty-six brains), this ratio has a value of 11·28 after 4½ hr. of swimming. The difference is $+0 \cdot 48 \pm 0 \cdot 12$ ($P < 0 \cdot 02$).

These figures indicate that during physical exertion a splitting off of amido-nitrogen from the polypeptidic chain of brain proteins takes place. This amido-nitrogen originates mainly from the bound glutamine[4,5]. This bound glutamine is therefore one of the sources of ammonia in the brain. As a result of this process, the chemical and physico-chemical nature of some proteins in the brain must necessarily change, as in the polypeptic chain the bound glutamine is changed into bound glutamic acid. The electropositive amidic functional group of the protein molecule is changed into the electronegative carboxylic group.

It may be of interest to direct attention here the marked energy content of the amidic bond the peptides, containing about 5840 cal./mol.[6]. Th amidic bond is actually a 'semi-macroergic' bon The disintegration of this bond is apparently relate to the increased functional activity of the brai nervous tissue during diffuse neuromuscular activit

The existence of structural changes in the protei of the nervous tissue during functional activity h been assumed by other authors[7] on the basis changes in the sorption of vital dyes. Similarl Koshtojanc and co-workers[8] have pointed to th significance of the functional groups of proteins the nervous tissue; their work was, howeve directed especially to functional —SH groups in th proteins of the nervous tissue. We believe we hav shown the significance of the amidic group of pr teins of the nervous tissue of brain for the functiona activity of this tissue.

A full account of this work will be publishe elsewhere.

## Antibiotically Active Amino-Acid Copolymers related to Gramicidin *S*

The chemical structure of the antibiotic peptid gramicidin *S* has been established as cyclo-(-L-Va L-Orn-L-Leu-D-Phe-L-Pro)$_2$[1]. In the attempt elucidate the relation between its chemical structu and the antibacterial activity, a number of relate di-, tri-, penta- and deca-peptides have been sy thesized, and their antibacterial activity tested These synthetic peptides contain some or all of th five amino-acids present in gramicidin *S* in the prop sequence. Appreciable antibacterial activity wa exhibited only by the linear decapeptide.

Mixtures of N-carboxyanhydrides of α-amino-acid can be easily copolymerized to yield α-amino-ac copolymers containing a predetermined ratio of th various constituents in an undefined sequence. W were thus able to prepare polyamino-acids containin the amino-acid residues present in gramicidin *S*, well as related copolymers, and to check their ant bacterial activity. The amino-acid copolymers liste in Table 1 were obtained as follows: α-N-carbox anhydrides of L-valine, L-leucine, L-proline, L-(D- an DL-)-phenylalanine, δ-carbobenzoxy-L-(and DL-) ornithine, DL-alanine and sarcosine were prepared the required monomers were mixed in the desire molar ratio and copolymerized in dioxane usin diethylamine as the initiator; the carbobenzox groups of the copolymers containing ornithine wer removed by means of anhydrous hydrogen bromid The number average of amino-acid residues pe

|  | Gramicidin *S* |  |  |  |  |  |  |  | 5 | 1 |

lypeptide molecule was calculated from end-oup analysis. The molar ratios of the amino-acids the copolymers were determined chromato-aphically after acid hydrolysis. Table 1 gives e minimal concentrations of the polypeptides sted at which no apparent growth appeared within ghteen hours on incubation of an inoculum of :0,000 organisms/ml. of *E. coli* in a synthetic, or *aph. aureus* in a semisynthetic, medium at 37°.

Table 1 shows that copolymer '1', composed of e amino-acids of gramicidin *S* in the proper ratio d steric configuration, has, under the experimental nditions used, an antibacterial activity similar to at of the natural antibiotic. The growth-curves *E. coli* in the presence of gramicidin *S* and of the nthetic copolymer '1' at equal concentrations, ven in Fig. 1, were found to be nearly identical.

A comparison of copolymers '1', '2' and '3' shows at changes in the steric configuration of the phenyl-anine and ornithine caused little difference in anti-cterial activity. The inactivity of polymers '14', 6' and '17' proves that the ornithine residue con-ining a free δ-amino group is essential for anti-cterial activity. This result is in accord with the servation[3] that acetylated or deaminated gramicidin is inactive. When the other amino-acids present gramicidin *S* are omitted or exchanged by DL-anine or sarcosine the antibacterial activity is re-ined to a considerable extent. In one case (No. 7) it even exceeded that of the natural product (cf. Fig. 1).

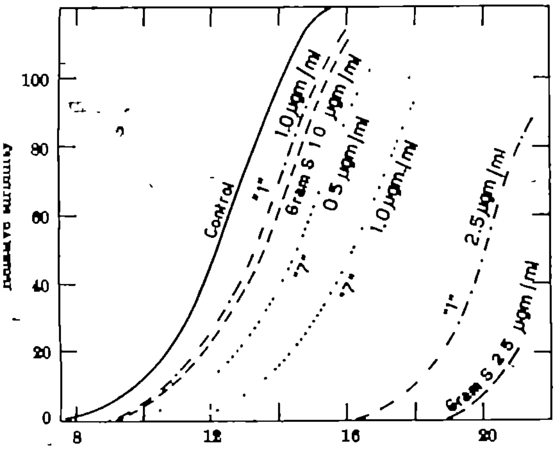

Fig. 1. Inhibition of *E. coli* (1·2 × $10^{6}$ organisms/ml. of synthetic medium at 37°) by gramicidin *S* (– – – –), copolymer '1' (—·—) and copolymer '7' (……)

As all the polyamino-acids investigated have an open-chain structure, it seems that a cyclic structure is not essential for antibacterial activity in the range of molecular weights indicated in Table 1.

The mode of antibacterial action of various amino-acid copolymers in synthetic as well as in more complex media is under investigation.

This investigation is supported by a research grant (*PHS.G*-3677) from the National Institutes of Health, Public Health Services, U.S.A. We want to express our thanks to Profs. H. Theorell and R. L. M. Synge, who kindly provided us with samples of gramicidin *S*.

## Antitubercular Effect of an Extract of *Adhatoda vasica*

THE report of Gupta and Chopra[1] on the anti-tubercular activity of the volatile principle of *Adhatoda vasica* prompted us to investigate the matter further.

2 lb. of undried leaf of *Adhatoda vasica* was coarsely chopped and distilled in steam to give about five litres of steam distillate. This was saturated with salt and extracted with chloroform, the extract dried over sodium sulphate and evaporated at room temperature. The brown viscid oil (3 gm.) was dried *in vacuo* below 30° C.

For the *in vitro* investigation the distillate was taken up in alcohol and serial dilutions were made in a medium of the Proskauer and Beck type. Growth of the *H37Rv* strain of *M. tuberculosis* (inoculum 0·03 mgm.) was inhibited at a dilution of 75,000 for 14 days. With a similar medium incorporating 5 per cent human serum, no inhibition was observed at a dilution of 10,000. Gupta and Chopra (*loc. cit.*)

quoted an inhibitory dilution of 500,000 for a human strain of *M. tuberculosis* (inoculum 0·01 mgm.).

The volatile principle was evaluated in 25-gm. Parkes albino mice. These were infected intravenously with the *Ravenel Rv* strain of *M. tuberculosis* (0·1 mgm.). Treatment was started on the day of infection and continued for 14 days, the drug being administered in the diet. The measured daily drug intake was approximately 340 mgm./kgm. mouse weight up to the seventh day. Median survival times of mice, with 19/20 limits of probability, were 14 (12·8–15·3) days for the treated mice compared with 16·3 (15–17·7) days for the untreated controls. This decrease in median survival time is just significant and may indicate toxicity. The pulmonary lesions, however, in the treated mice were indistinguishable from those in the controls.

It may be concluded from these results that the volatile principle of *Adhatoda vasica*, as prepared by us, has no antituberculous properties in mice on oral administration.

## Effect of Isolated Cerebral Hypoxia and Hypercapnia on Sodium Excretion

The healthy organism, as is well known, reacts to a number of influences (such as work, etc.) by decreased sodium excretion. In such cases a relative hypoxia occurs: in pathological sodium retention (cardiac decompensation, famine œdema, anæmia, etc.) an absolute hypoxia (arterial, stagnating or anæmic) can be demonstrated.

It is to be supposed that in all these states a causal relation must exist between the hypoxia and the decreased sodium excretion. We have therefore investigated, in a series of experiments on dogs, the effect of hypoxia on sodium excretion. In these experiments the rate of glomerular filtration was estimated by endogenous creatinine clearance, the sodium was determined by flame photometry, the oxygen content according to Issekutz, and the carbon dioxide according to Van Slyke.

(1) In fifteen experiments we dealt with the effect exercised on sodium excretion by hypoxia of the entire body. The dogs were under chloralose anæsthesia. The hypoxia was induced by inhalation of a nitrogen mixture containing 10 per cent oxygen. In fourteen cases the sodium excretion decreased significantly, to an average of 16 per cent. The sodium excretion occurred in some cases with unchanged sodium filtration, proving the effect to be of tubular origin.

(2) We have also investigated the question whether the fall in sodium excretion could be brought about by isolated cerebral hypoxia. For this purpose we made a preparation in which only neural connexion was maintained between the head and the body.

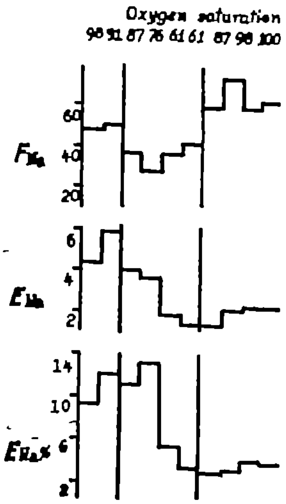

Fig. 1. F(Na), filtered sodium (m.equiv.); E(Na), excreted sodiu (m.equiv.); E(Na %), excreted sodium as a percentage of filtere sodium

Circulation in the isolated head was maintained by Dale–Shuster pump. In all cases the vertebral arteri and veins were ligated and in some instances t spinal veins also. In some cases the sinus carotic was denervated. In fourteen of sixteen experiment there was a definite decrease in sodium excretic as an effect of the cerebral hypoxia (Fig. 1). It al occurred in animals in which the spinal veins we ligated, as well as in those with denervated sin caroticus. Hypercapnia brought about the san results.

The same effect was obtained when stagnati hypoxia was induced in the brain by reducing th perfusion pressure of the Dale–Shuster pump. I these cases, too, the sodium excretion fell to 21 p cent of the original.

Finally, during some of these experiments, v considered the effect exercised on sodium excretic by hypoxia of the isolated body. In parabiosis, th head of the acceptor animal was perfused throug the carotids with blood (100 per cent oxygen satur tion) from the donor dog. Hypoxia of the body the acceptor animal was induced by inhalation of a oxygen–nitrogen gas mixture with reduced oxyge content. Sodium excretion decreased here, too, as i isolated head hypoxia.

From these experiments the conclusion is draw that isolated cerebral hypoxia and hypercapnia lea to a decreased sodium excretion. We believe th volume-regulating phenomenon to be of importanc Our results, which show that the effect also occurs i body hypoxia, indicate that there are recepto sensitive to hypoxia not only in the brain but al throughout the whole organism. It is still a questio however, which of these receptors are the mo sensitive.

This work will be published in detail in *Ac Medica Hungarica.*

## Genetic Recombination in *Streptomyces*

THE Actinomycetes have properties intermediate tween those of the fungi and those of the bacteria. in practically all bacteria and in many fungi, exual cycle is not known to occur in the Actino- ycetes. In some bacteria and Fungi Imperfecti[1], wever, there are parasexual processes[2], that is, ocesses leading to genetic recombination otherwise an via sexual reproduction. The present com- mication reports the discovery of a recombination ocess in an Actinomycete, *Streptomyces coelicolor* einer-Müller.

The two starting strains used were kindly supplied Dr. A. Tonolo. One of them produces a deep blue gment[3] diffusing into the agar ; the other, a mutant om the first, does not produce it. Both grow well a chemically defined minimal medium[4] containing ly glucose and inorganic salts.

Two multiple mutants were isolated by successive tra-violet irradiations of spores : one with require- ents for methionine and histidine and producing ue pigment (5 *me hist*) from the first strain, and e with requirements for proline and glutamic id and not producing the blue pigment (14 *pr u pigm*) from the second strain. The mutants ew well either on the minimal medium sup- emented with the respective requirements, or a 'complete medium'[5] containing peptone, yeast tract, etc.

The two multiple mutant strains, 5 *me hist* and *pr glu pigm*, were streaked separately and together slants of agar media made up of mixtures of the inimal and the complete media (in proportions arying from 3 : 1 to 1 : 1). Separately the two rains grew very little in these mixtures ; but the ixed inoculum produced abundant growth in two three days, with intense blue pigmentation of the gar and abundant sporulation. A suspension in istilled water of spores from the mixed culture was ltered, and the spores, washed by centrifugation, ere plated on the minimal medium. For 'viable ounts' part of the same suspension was also plated, fter suitable dilution, on the complete medium. An nexpectedly large number of the spores produced rowth on the minimal medium. The time for which e mixed culture was grown before harvesting the ores and plating them on the minimal medium as varied from three to nine days with the results own in Table 1.

As a control of the experiment reported in the first ne of the table, $12 \times 10^6$ spores of strain 14 *pr glu igm* alone, plated on the minimal medium, produced o growth ; neither did $24{\cdot}7 \times 10^6$ spores of strain 5 *e hist* alone. Even a mixed suspension of spores of e two strains ($34 \times 10^6$ spores) obtained from parate cultures produced no growth. Clearly a eriod of mixed growth is necessary for spores pro- ucing prototrophic colonies to arise.

Table 1

| Mixed culture medium (min./complete) | Age of mixed culture (days) | No. of spores from mixed culture plated on the min. medium (corrected for viable counts) | Colonies growing on the min. medium ('prototrophic') | Prototrophic colonies per cent of spores plated |
|---|---|---|---|---|
| 1/1 | 4 | $46 \times 10^6$ | 10,800 | 0·023 |
| 3/1 | 3 | $3\ 4 \times 10^6$ | 200 | 0 008 |
| 3/1 | 4 | $4 \times 10^6$ | 0 | 0 |
| 3/1 | 6 | 580 | 250 | 43 |
| 3/1 | 7 | 7,000 | 910 | 13 |
| 3/1 | 9 | 4,000 | 780 | 19 |

Table 2

| Mixed culture medium (min./complete) | Age of mixed culture (days) | Supplements added to the min. medium for plating spores from mixed culture | Rate of recombination (per cent) | No of colonies tested | Recombinant types obtained No. | Type |
|---|---|---|---|---|---|---|
| 1/2 3 | 7 | proline, histidine | 3·1 | 36 | 3<br>4<br>29 | *pr*<br>*hist*<br>+ |
| 1/2·3 | 7 | glutamic, methionine | 1 4 | 482 | 1<br>481 | *me*<br>+ |
| 1/1 | 16 | histidine, glutamic | 19 | 168<br>– | 9<br>7<br>136 | *hist*<br>*pigm*<br>+ |
| 1/1 | 16 | methionine, proline | 4·6 | 300 | 34<br>2<br>264 | *pr*<br>*pr me*<br>+ |

The symbols indicate the requirement or the absence of blue pigment (*pigm*). + indicates the wild type, that is, no requirement and presence of blue pigment.

Recombinant strains presenting requirements of one or both of the parent strains were identified and selected by the following method. Spores from mixed cultures were plated on the minimal medium partially supplemented with the substances required by the parent strains. All the possible combinations of substances required by the parent strains were tried except those which would permit the growth of either or both parent strains.

A number of colonies showing growth on these media were tested for their nutritional requirements, and the presence or absence of the blue pigment noted. Table 2 gives details of the results.

Thus, three types of recombinants occurred among the strains isolated : (*a*) with all the 'wild' characters of the starting strains ; (*b*) with some 'wild' characters of one strain and some mutant characters of the other strain ; (*c*) with mutant characters from both strains (*pr me*).

## Rate of Metabolism in Tardigrades during Active Life and Anabiosis

SOME species of tardigrades are noted for the ability to survive complete desiccation[1]. When dried, the animals are able to withstand extreme temperatures and lack of oxygen. The experiments described here were made with the purpose of contributing to the knowledge of the metabolism of tardigrades during the period of anabiosis.

First, the rate of metabolism during anabiosis was measured and compared with that during active life[2]. Two species were used : *Macrobiotus hufelandi* Schultze, a moss-inhabiting species, able to survive

Table 1. Oxygen Consumption at 20° C.

| Species and life-stage | Oxygen (μl. × $10^{-6}$) per hr. per individual |
|---|---|
| *M. dispar* | |
| Active | 1,000 |
| Cyst | 240 |
| *M. hufelandi* | |
| Active | 980 |
| Dried | 1·6 |

lack of water, and *Macrobiotus dispar* Murr.; a fresh-water form, able to encyst. The oxygen consumption was measured at 20° C. by the Cartesian diver micro-gasometer, as developed in the Carlsberg Laboratory, Copenhagen, except with dried animals, when a minor modification was introduced to increase sensitivity[3]. The results are summarized in Table 1; they show clearly the difference between encystment metabolism and true anabiosis.

In the second series of experiments the relation between rate of metabolism of dried *M. hufelandi* and humidity of the air was investigated[4]. Both the 'standard' and the 'sensitive' type of the Cartesian diver were used. The humidity of the air was kept constant by placing in the divers droplets of sodium chloride or calcium chloride solutions of appropriate concentration. The divers were charged with 300 or 30 animals, according to the rate of metabolism. The results are shown in Table 2.

Table 2. Oxygen Consumption by Dried *M. hufelandi* with Different Relative Humidities of the Air, at 25° C.

| Relative humidity (per cent) | Oxygen (μl. × $10^{-6}$) per hr. per individual |
|---|---|
| 25 | 0·4 |
| 48 | 0·4 |
| 59 | 1·1 |
| 75 | 2·4 |
| 83 | 2·9 |
| 90 | 4·8 |
| 93 | 7·6 |
| 95 | 27 |
| 96 | 57 |
| 97 | 89 |
| 98 | 160 |
| 99 | 340 |
| 100 | 690 |
| Water | 1,130 |

The results show a logarithmic increase of metabolic rate with increase in humidity of the atmosphere. At the lowest humidities (25 and 48 per cent) the respiratory rate is very slow, and the error involved accordingly large; the results show merely that there is some oxygen consumption at these humidities. Respiration in water recorded in Table 2 differs slightly from the results in Table 1; it was measured with the same animals which were used in the investigation of the effect of humidity on respiratory rate.

## Location of Enzymes in Mitochondria Fractions

It appears from several published works duri recent years that a large number of enzymes ha been located in the mitochondria fractions by mea of differential centrifugation of tissue homogenat especially of animal cells. Duve and Berthet[1] ha tried to standardize the conditions of centrifugati in different types of instruments so that the resu may be reproduced, and they urge that some attenti should be paid to such factors as diffusion- and co vection-currents and also to the manner of decantatio Some errors are, however, possible with this ty of work, as have been pointed out by Brachet[2] whi discussing the nuclear control of enzymic activitie during homogenization and differential centrifugatio soluble enzymes can no doubt be adsorbed on particle but the microsomes (submicroscopic cytoplasm granules) may release enzymes which are normal bound to them just as in the case of crushing t cell constituents in different media. By this meth it is scarcely possible to get information on the inte actions occurring between the different fractions in normal living cell and to be sure that the vario particles obtained by differential centrifugation a really the ones which pre-existed in the intact ce In this connexion, Holter[3] has also discussed the pr found changes that the process of homogenizatio involves; he points out that the hyaline groun plasm of most cells is not miscible with water an that a certain degree of autolysis is indispensable i order to set the cytoplasmic particles free and th this autolysis must have far-reaching consequenc with regard to enzyme yield and enzyme distributio

By growing fungi (*Polyporus durus*, *Polystict sanguineous*, *Daedalea flavida*, *Phoma casuarinae*, etc separately in fatty acid medium, 4 per cent gluco and 2 per cent peptone medium, I[4] obtained synthes of fat drops, glycogen granules and protein granul respectively around the vacuoles in growing hyph tips. My attention[5] was first directed to this kin of work following the deposit of starch grains i various algae (*Spirogyra*, etc.) around the pyrenoid which show vacuoles at their centre. By followin the successive stages of plasmolysis of a health fungal cell one can observe how the vacuolar mem branes act as seats of hydrolysis as well. From th experimental facts I formed the conclusion that th plant vacuoles (especially in fungi) most probabl function as store-houses of enzymes. The late Prof Guillermond[6] discarded the idea that the mitochondri are the means by which every synthesis in plan cells takes place. To get satisfactory evidence, "th mitochondria must be broken down into less organize units and finally the enzymes should be isolated an characterized" (cf. Davies[7]).

It should be noted, however, that young health green plant cells in the growing state always contai a number of vacuoles and two types of mitochondri (cf. Sorokin[8])—'active' mitochondria which becom transformed into plastids and which do not colou with vital stain (Hoechst's Janus green *B*), an 'inactive' ones which remain as such and specificall colour blue with Janus green *B*—but in the majorit of fungi 'active' mitochondria (that is, plasts an plastids) are lacking.

According to Cowdry[9], normal healthy animal cells which are devoid of plastids, contain very few or n vacuoles, and since highly vacuolated cells die o more rapidly than the non-vacuolated ones, th uoles have been called by Cowdry degeneration-uoles. Hence, it may be possible that in animal s mitochondria are structurally associated with ymes within the living cell; but recent studies Duve *et al.*[10] on rat liver cells show that this clusion is not necessarily warranted.

## Plane of Bilateral Symmetry in Plant Cilia

HIS fact of bilateral symmetry in cilia has been ch more easily demonstrated than the plane of mmetry itself. The fact is implicit in the numerical ations of the component fibrils[1] (a ring of nine und a central pair); but unless there are external pendages or some other criteria with respect to ich the orientation of the whole organ can be erpreted the median fibril cannot be recognized. is difficulty was encountered by Fawcett and rter[2], who interpreted their very fine sections of mal cilia in terms of a plane of symmetry passing ough and not between the two central strands, l a similar interpretation was given by Manton, rke and Greenwood[3] for the seaweed *Dictyota* on basis of external morphology. In neither case, wever, was the possibility excluded that the plane symmetry might in fact be at right angles to the e joining the two central strands, and Fawcett and rter's outline diagrams do indeed somewhat ggest this.

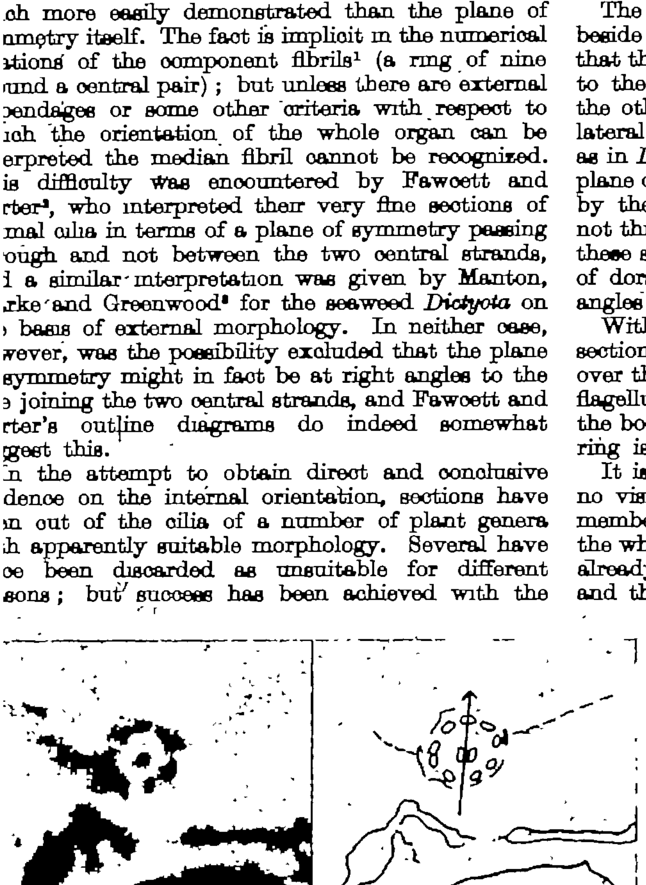
n the attempt to obtain direct and conclusive dence on the internal orientation, sections have n cut of the cilia of a number of plant genera h apparently suitable morphology. Several have ce been discarded as unsuitable for different sons; but success has been achieved with the spermatozoids of the brown seaweed *Fucus*. For this[4] it is already known that the front flagellum has two rows of lateral hairs and that there is a peculiar and highly characteristic membranous organ (the 'proboscis') at the base. The smooth hind flagellum, which is without appendages, is held in a fixed position where it passes over the eyespot. Sections through either of these two special regions would give the desired information.

Sections of these and other levels will be published in detail elsewhere; but one sample is reproduced in Fig. 1. It is part of the front end of a longitudinally cut spermatozoid in the region of the upturned proboscis and front flagellum, both of which are cut approximately transversely. The mutual relations of the flagellum and proboscis make it quite certain that they belong together and that the section is not far above their point of union. The plane of section is such that the hairy appendages (Flimmer) are visible on both sides of the flagellum. Since there is no precise correspondence between the levels at which the hairs emerge on the two sides the slight obliquity of the section is a prerequisite to locating both lateral lines simultaneously. The interpretation of the section is further assisted by the fact that dismemberment of the cilium has begun to take place, the ciliary membrane being partially disrupted and the fibrils, except for two on the left-hand side, being spaced farther apart than would otherwise be the case.

The critical details are shown in an outline diagram beside the photograph. As in *Dictyota*, it is found that the odd (median) fibril lies outwards with respect to the cell body. If this fibril is numbered 0 and the others 1, 2, 3, 4, on each side, the origin of the lateral hairs is in close proximity to fibril 2, again as in *Dictyota*. It is quite obvious, however, that the plane of bilateral symmetry of the outer ring (marked by the arrow in the diagram) passes between but not through the two central strands. The line joining these strands is therefore in, or parallel to, the plane of dorsiventrality of the whole organ but at right angles to the plane of bilateral symmetry.

With this information it is possible to interpret sections of the smooth hind flagellum where it passes over the eyespot, and it is found that, as in the front flagellum, the plane of dorsiventrality is parallel to the body, and the odd median fibril of the peripheral ring is outwards.

It is thus fully apparent that, even when there is no visible structural differentiation among the nine members of the peripheral ring, the orientation of the whole organ is by no means at random. This was already indicated from Fawcett and Porter's sections and their observation that, when cilia are arranged in rows as in the gill epithelium of *Mya*, the central pair of fibrils in every cilium is in a plane at right-angles to the row. It may now be suggested that this plane is likely to be that of dorsiventrality, the plane of symmetry in *Mya*, as is *Fucus*, being at right-angles to this and therefore parallel to the direction of the row.



ig. 1. Electron micrograph (MX18.13) of a section cut near the base of the ront flagellum of the spermatozoid of *Fucus serratus*; part of the cell ody and membranous proboscis visible below the flagellum. For further explanation, see line diagram and text. Magnification × 30,000

All this supports strongly the view put forward on previous occasions by us and no doubt by other workers that bilateral symmetry in cilia is likely to be of primary functional significance for the mechanism of their movements.

The micrograph reproduced was taken on the Philips' electron microscope in the research laboratories of Tootal Broadhurst

## Behaviour Differences in Two Strains of *Aëdes aegypti*

Attention has recently been directed to differences in the hatching response between eggs of a West African strain of the mosquito *Aëdes* (*Stegomyia*) *aegypti* (L.) from Lagos, Nigeria, and those of an East African strain of the same species from Newala, Tanganyika[1]. Further work on these two strains now discloses differences affecting behaviour of the adults: in the Lagos strain, unmated females usually lay eggs within five days of taking a blood meal; in the Newala strain, unmated females rarely lay eggs within this period (Table 1).

Table 1. Proportion of *A. aegypti* laying Eggs within Five Days of taking a Blood Meal

| Lagos strain | | Newala strain | |
|---|---|---|---|
| Mated | Unmated | Mated | Unmated |
| 61/67 (91 per cent) | 74/86 (86 per cent) | 48/54 (89 per cent) | 4/53 (8 per cent) |

The relation between mating and ovulation has been noted by various workers in certain Anthomyid and Tachinid flies[5-7] and in *A. aegypti* by MacGregor[8], who claimed that ovulation was dependent on the presence of sperm in the spermathecæ and of blood in the stomach. Whatever the male's contribution is, in this species, it is clear that in the Lagos strain the female is largely or wholly independent of it. The following preliminary experiments provide some additional information on this subject.

When unmated females of the Newala strain were afterwards mated at varying intervals from 3 to 23 days after a blood meal, 61 out of 76 (80 per cent) of them laid their eggs on the second or third day after fecundation. Thus, while blood in the stomach is necessary for activation of the ovaries, it is clearly not necessary for ovulation, which appears in this strain to depend on mating only. It is apparent, however, that the act of mating is itself not the effective stimulus, since ovulation did not follow when females were mated to infertile males. Evidence for this was obtained by mating groups of eight females, one at a time in quick succession, to single males. Each male was able to cope with the eight females one after another; but only the first three or four females were successfully fertilized (Table 2). Repeated feeding of these groups of females at 6-day intervals did not alter the overall picture; after each feed, fertile eggs were laid by the first three or four mates, a few infertile eggs were laid by some of the fourth and fifth mates, but no eggs were l by any of the sixth, seventh or eighth mates.

Table 2. Combined Results of mating 5 Groups of 8 Fema each (*A. aegypti* Newala Strain) to Single Males (see T

| ♀♀ (8/♂) in order of mating | No. of ♀♀ laying eggs | | No. of eggs laid | | Mean day of laying | |
|---|---|---|---|---|---|---|
| | Fertile | Infertile | Fertile | Infertile | Fertile | Infer tile |
| 5 first mates | 5 | — | 399 | — | 2·0 | |
| 5 second mates | 5 | — | 335 | — | 2·4 | |
| 5 third mates | 5 | — | 325 | — | 2·4 | |
| 5 fourth mates | 2 | 1 | 177 | 17 | 3·0 | 3·0 |
| 5 fifth mates | — | 1 | — | 3 | — | 5·0 |
| 5 sixth mates | — | — | — | — | — | — |
| 5 seventh mates | — | — | — | — | — | — |
| 5 eighth mates | — | — | — | — | — | — |
| Totals | 17 | 2 | 1,236 | 20 | | |

While these results seem to support the first p of MacGregor's claim, that it is the presence of spe in the spermathecæ which stimulates ovulation, t following observations suggest that it may in f be the presence of seminal fluid rather than sper Males of the Newala strain, apparently exhausted sperm by three or four consecutive matings, w again able to fertilize females after a rest of 36 When, however, apparently exhausted males w rested for shorter periods, mating resulted in the l ing of infertile eggs. Thus even sixth and seven mates were induced to lay batches of 84 and infertile eggs on days 3 and 4 respectively. It see possible that females of the Newala strain ovul when they receive spermless seminal fluid, and t may perhaps account for small numbers of infert eggs laid by some of the fourth and fifth mates, th is, when sperm is exhausted but fluid is neverthel introduced into the spermathecæ.

When these experiments were repeated using t Lagos strain, the results were entirely differe Females mated to infertile males resembled normal mated females in usually laying their eggs within t to five days of taking a blood meal (Table 3). T number of infertile eggs, however, laid by such femal was usually less than the number of fertile eggs la by normally mated females, and they were usual laid some 12 hr. later. Unmated females of t Lagos strain, or females mated to infertile mal continued to lay batches of infertile eggs with two to five days after each of ten successive blo meals.

It is suggested that females of the Lagos stra produce some substance which stimulates ovulatio and that extra production of this substance follo impregnation by the male. This substance seems

Table 3. Combined Results of mating 7 Groups of 8 Femal each (*A. aegypti* Lagos Strain) to Single Males (see Text)

| ♀♀ (8/♂) in order of mating | No. of ♀♀ laying eggs | | No. of eggs laid | | Mean day of laying | |
|---|---|---|---|---|---|---|
| | Fertile | Infertile | Fertile | Infertile | Fertile | Infertile |
| 7 first mates | 6 | 1 | 404 | 52 | 2·5 | 4·0 |
| 7 second mates | 7 | — | 454 | — | 2·9 | — |
| 7 third mates | 5 | 2 | 323 | 79 | 2·6 | 3·0 |
| 7 fourth mates | 6 | 1 | 304 | 80 | 2·7 | 3·0 |
| 7 fifth mates | 5 | 2 | 245 | 49 | 3·4 | 3·5 |
| 7 sixth mates | 2 | 5 | 51 | 248 | 3·0 | 3·2 |
| 7 seventh mates | — | 7 | — | 298 | — | 3·6 |
| 7 eighth mates | — | 7 | — | 280 | — | 3·7 |
| Totals | 31 | 25 | 1,781 | 1,086 | | |

| | | | |
|---|---|---|---|
| Average No. of eggs/fertile female | — 57·5 | Mean laying time of fertile eggs | — 2·9 d |
| Average No. of eggs/infertile female | — 43·4 | Mean laying time of infertile eggs | — 3·4 d |

ranting in females of the Newala strain, but ars about two days after impregnation by the ı. Such a substance might be a product of the us allatum or of the neurosecretory cells in the n[9], production of the substance depending, in the ala strain, on a stimulus resulting from filling of spermathecæ.

series of crosses between these two strains is now g undertaken, in the hope that further light will hrown on this subject.

## Cell Surface and Fertility in *Escherichia coli*

'ERTILE or $F^+$ strains of *Escherichia coli* have been ned[1,2] as those which are productive of recom- ants even when crossed with sterile strains; other ins, $F^-$, are defined as those which are productive recombinants only if crossed with fertile strains. tility is transmissible from $F^+$ to $F^-$ cells by ection' due to an agent ($F$) which is not separable n the cells[1,2].

The screening of strains and clones for fertility ends upon these definitions, namely: (1) capacity recombine with test strains of known $F$ polarity; ability to transmit fertility to sterile strains. h methods, even in the most skilful hands, are time suming and discourage the undertaking of large- le experiments. Unfortunately, no changes, either rphological or physiological, have been correlated far with the $F^+$ state, other than the strictly etical ones already mentioned[3].

Nevertheless, it seemed worth while to investigate surface of cells endowed with opposite $F$ polarity. h investigations, which are in progress in this titute, on different lines of work, have already lded some consistent results which are here sented.

Eight strains of *E. coli K* 12 (kindly supplied by . L. L. Cavalli) were chosen which allow of factorial- tion of: (1) two groups of markers, including chemical deficiencies, sugar fermentation and us resistance; (2) sensitivity and resistance to antibiotic (streptomycin); (3) fertility and rility. Cells of such strains, from standardized tures, were washed twice in distilled water and re suspended in a buffer (citric acid/disodium drogen phosphate) adjusted for $p$H values ranging m $p$H 2 to 5, at intervals of $p$H 0·2, in order to termine for each strain at which $p$H suspended ls are precipitated. The results and their analysis ow that the factor which has by far the most effect the $p$H-precipitability of the strains studied is the polarity, the precipitating $p$H for $F^-$ strains being hly significantly more acidic than that for $F^+$ ains. In addition, analysis of the results shows at a minor but significant effect is due to the rkers already mentioned.

Secondly, on staining the same strains at different $p$H values, by means of a mixture of an acid and a basic dye, like methylene blue and acid fuchsin[3], $F^-$ strains show a greater affinity for the basic dye than $F^+$ strains.

Thirdly, the nephelometric study of the growth pattern in liquid medium (*I.S.M.* nutrient broth, $p$H 7·3) shows that there is a greater spontaneous instability of broth-cultures of fertile strains, compared with that of the corresponding sterile strains. In fact, both $F^-$ and $F^+$ strains grow at the same rate for the first few hours, up to a population density at which $F^+$ cells are spontaneously precipitated, but $F^-$ cells do not. In other words, the greatest density of growing cells which can remain stably suspended in the culture medium is far greater for sterile strains than for fertile ones.

As a whole, these results suggest a difference in surface charge between the strains studied, due to a difference in $F$ polarity. This conclusion is supported by an electron microscopic investigation on the same strains, which showed no morphological equivalent of fertility at the level of the cell surface. Indeed, presence or absence of an outer membrane, of cilia, filaments[4], etc., seems to be unrelated to $F$ polarity. But a not irrelevant by-product of this investigation is the demonstration that, while all the eight strains are ciliated, only the four bearing markers for deficiency for biotin and methionine and resistance to phage $T_1$ are endowed with filaments, while the four strains bearing the other group of markers, namely, deficiency for threonine, leucine and thiamine, inability to ferment lactose, galactose, maltose, arabinose, xylose and mannitol, are completely devoid of filaments. This conclusion has promoted other investigations using such a 'morphological marker' to study the phenology of the $F$ transmission and to detect the biochemical pattern correlated with production of filaments by the bacterial cell.

Determination of the $\zeta$ potential on cells with opposite $F$ polarity will be the logical development of experiments quoted above; but results on electrokinetic mobility can be very misleading, unless they are based on a substantial knowledge of the morphology of the cell surface[5]. This is one reason why an electron microscopic investigation was carried out at this point in our researches. On the other hand, it seems that the finding of a chemico-physical property and a cultural pattern associated with fertility, at least so far as the eight strains studied are concerned, supplies a simple and, therefore, useful technique for studies on the transmission of the $F^+$ state. In fact, recombination tests applied to forty clones from each of two $F^-$ strains, infected with two different $F^+$ strains, have yielded results fully consistent with a previous screening of the same clones for growth pattern in *I.S.M.* nutrient broth.

Further, the description of the eight original strains, by means of the nephelometry of forty clones of each, has given quantitative results very suitable for thorough statistical analysis, which has supplied information in perfect agreement with that given by the $p$H-precipitability experiments.

What is more important, the same technique permits a detailed study of the kinetics of infection and has already produced results completely confirming and integrating what is known on the transmission of the $F$ agent. Further investigations are being carried out.

Fertility and sterility in bacterial cells may thus be nothing more than an epiphenomenon of their surface charges; on the other hand, the observed differences of surface charge may be a minor effect of the *F* agent which is supposed to transmit fertility. Our results make the first hypothesis no more unreasonable than the second one.

## Herpetichthyes, Amphibioidei, Choanichthyes or Sarcopterygii?

During recent decades, our ideas on the classification of fishes have changed greatly. In the early years of the century, it was believed that among the higher bony fishes (Osteichthyes), the ray-finned forms and crossopterygians were closely allied, and that the lungfishes were remote from the two, representing a presumably primitive if aberrant group. As an expression of such beliefs may be cited Goodrich's work on fishes in the Lankester "Treatise on Zoology"[1], in which the Osteichthyes are divided into two subclasses, one for the Dipnoi alone, the other, the Teleostomi, including both Crossopterygii and the Actinopterygii. In succeeding decades, however, a radical change of opinion occurred. Principally due to the work of Goodrich himself and of Gregory and Watson, it became clear that the primary dichotomy of the Osteichthyes was of another sort, one major subdivision including the Actinopterygii alone, the other both Crossopterygii and Dipnoi. Huxley, in 1880[2], coined the name Herpetichthyes to describe the sub-tetrapod evolutionary stage represented by *Ceratodus*, and Smith Woodward, in 1931[3], suggested the expansion of the term to include (*contra* Huxley) the crossopterygians. Hubbs, in 1919[4], proposed Amphibioidei for Dipnoi plus Crossopterygii, and other writers have suggested an expansion of Crossopterygii to include the Dipnoi as well. Säve-Söderbergh, in 1934[5], in an unorthodox essay in classification, proposed a major subdivision of the vertebrates, including all the tetrapod classes plus the two fish groups concerned, to be named the Choanata, in reference to the presence of internal nostrils. I have (like others) rejected this classification, but in 1937[6] suggested that Choanichthyes would be appropriate as a designation for the included fish groups. None of the three terms previously suggested has met with any marked degree of acceptance; Choanichthyes has been adopted by a number of recent writers.

The deadening hand of legal 'priority' fortunately does not (and should not) extend to systematic categories on this high level. Names of this sort should be meaningful and, if possible, diagnostic—particularly in such a group as that under consideration, which is of such importance that it merits mention and discussion on even the most elementary levels of zoological and geological teaching. From this point of view, I feel dubious as to whether term Choanichthyes should be retained. The lu fishes have internal narial openings, to be sure, it seems certain that the crossopterygian ancest of the tetrapods had choanæ. But in coelacant choanæ were lost at a very early stage, if ever pres at all. The internal narial openings of the lungf do not function as choanæ, for they are passa for water, not air, and Jarvik[7], among others, raised doubts as to their homology with true choa

But despite my doubts about the use of the te Choanichthyes, no better case can be made alternatives which have been proposed. As rega the use of Herpetichthyes or Amphibioidei, the fis concerned are related to amphibian ancestry; the only living member of the group, *Latimer* is as un-amphibian as any fish can be. To Crossopterygii in the expanded sense proposed wou distort the meaning of the term so greatly as create confusion.

A name which is highly appropriate and didact ally useful can, however, be derived from fin structu In contrast to the typical Actinopterygii, crossopterygians and lungfishes have fleshy, lob fins, covered with scales and with a well-develop internal skeleton of archipterygial type. May suggest, for discussion, the possibility that, contrast to the 'ray-finned fishes', the forms he considered be termed 'fleshy-finned fishes' Sarcopterygii?

---

We are glad to see Prof. A. S. Romer's authori withdrawn from the unhappy term Choanichthye but we do not think it necessary or desirable to co a new one to cover the Rhipidistia, Actinistia a Dipnoi. We would revert to calling them Crossopterygii.

The name Crossopterygii in its original for (Crossopterygidae) was introduced by T. H. Huxle to include members of all of the above-named group as well as *Polypterus*, which to-day is excluded fro the Crossopterygii in whatever sense the term is use In Huxley's Crossopterygidae were *Osteolepis*, th Coelacanthidae, *Dipterus*, *Phaneropleuron* and th fossil *Ceratodus* (the last with a query, since it w known only from dental plates). Huxley furth directed attention, "without wishing to lay too mu stress upon the fact", to the resemblance betwe *Lepidosiren*, the only living dipnoan then know and *Dipterus*, *Phaneropleuron* and the coelacanth mentioning the paired fins and the endoskeleton an comparing the teeth with those of *Dipterus* and th "stiff-walled lung" with the ossified air bladder one of the fossil coelacanths.

In 1881, in the work referred to by Prof. Rome Huxley was thinking as a comparative anatomis and gave the name Herpetichthyes to *Ceratod* (= *Neoceratodus*) and its hypothetical ancestor *todus* was, he wrote, "an extraordinarily little-lified representative of that particular stage of ution of which both the typical fishes and the phibia are special modifications". He did not elate this conception with his earlier study as a pontologist, and his term does not suit our present pose.

/e now know of the close relationship between *ceratodus* and the fossil Dipnoi among Huxley's ssopterygidae. The classifications which set the noi apart from the Rhipidistia were first those 1 as Goodrich's of 1909[2] and Berg's of 1940[3], ch grouped the Rhipidistia and Actinistia with Actinopterygii as Teleostomi. In so doing, drich did away with the term Crossopterygii; in 1930[4] he revived it for Rhipidistia and Actin-, though still as a division of Teleostomi.

ome authors (Stensiö[5], Romer[6,7]) who have not mitted the major cleft between Dipnoi and Teleo-ni have still used Crossopterygii for the Rhipidistia l Actinistia only; hence their need for another ne under which to unite them with the Dipnoi. ers (Regan, 1929[8]; Moy-Thomas, 1939[9]; Tre-vas and White, 1950[10]) have used Crossopterygii in in Huxley's sense, purged only of *Polypterus*. s latter course we believe to be the most useful.

Vestoll[11], in a closely reasoned comparison of moi and Rhipidistia, concludes (p. 159): "The dence of Devonian forms shows very clearly that early Dipnoi were very closely related to the temporaneous Rhipidistia". It is generally epted that the Actinistia (Coelacanthini) were an ly offshoot from the Rhipidistia, and such adum-tions of the soft anatomy of *Latimeria* as we have far received[12] show that the two "living fossils", *timeria* and *Neoceratodus*, have retained many tures of a common archaic organization.

These facts all support the classification of Regan 1 Moy-Thomas, that is:

OSSOPTERYGII

Rhipidistia (Osteolepidoti).
Actinistia (Coelacanthini).
Dipneusti (Dipnoi).

There is much, however, to be said for indicating closer relationship of Osteolepidoti and Coel-anthini to each other than to the Dipnoi[13,14]. This uld well be done in the following classification, ich we now propose:

bclass CROSSOPTERYGII

Order Rhipidistia.
  Suborder Osteolepidoti.
  Suborder Coelacanthini.
Order Dipnoi.

The meaning of Rhipidistia ('fan-sails') is appro-iate to both its suborders. The term Actinistia well lost in favour of its familiar synonym elacanthini. Those who have used the text-books Stensiö, Romer[7] or Forster-Cooper[15] have no new rms to learn, but need only note that Crossopterygii used in its old, wider sense and Rhipidistia in a wly expanded sense. The roots of the subordinal mes could be used, if desired, with endings uniform ith those of any system (Osteolepidoidea, Coela-nthoidea for Regan's classification).

To conclude, we advocate reversion to the use of ossopterygii in the sense of Regan and Moy-iomas as a subclass of the class Osteichthyes Pisces *sensu* Regan), to include the Rhipidistia Osteolepidoti + Coelacanthini) and Dipnoi. In support of this we plead: (i) continuous though not universal usage, only slightly modified from that of its original proposer, (ii) a suffix which corresponds to that of the equal-ranking Actinopterygii, and not to the words Dipnoi or Dipneusti, (iii) an appropriate meaning, (iv) conformity of the resulting classification with the results of recent research and (v) the possibility it provides of discarding redundant terms rather than coining new ones.

## *In vitro* Stimulation of Incorporation of Formate-$^{14}$C in Surviving Uterine Segments by Hydroxylated Œstradiols

RECENT studies in this laboratory have demonstrated that the incorporation of formate-$^{14}$C into protein by surviving uterine segments is an early and sensitive indicator of œstrogen action (unpublished work with A. M. Herranen). Six hours after a single intravenous injection of 10 μgm. of œstradiol-17-β, the incorporation of formate *in vitro* by uterine horn segments is accelerated 250 per cent over the controls. The addition of the natural hormones directly to the *in vitro* incubation media has little or no effect on formate metabolism. In contrast, it is shown in this communication that the addition of the 2-hydroxy or 4-hydroxy derivatives of œstradiol to the reaction mixture results in a significant acceleration of the incorporation of formate-$^{14}$C into the proteins of the uterine segments.

The 2-hydroxy and 4-hydroxy derivatives of œstradiol (2,3,17β-trihydroxy œstratriene and 3,4,17β-trihydroxy œstratriene) were synthesized by a route involving the nitration of œstrone, chromatographic separation of the positional isomers, reduction of the 17-keto group, reduction of the nitro group and the photodecomposition of the diazonium salts. In addition, the 4-hydroxy œstradiol was synthesized by an alternative route through the 4-phenyl azo compound. Details of synthesis and proof of structure will appear elsewhere (unpublished work with M. E. Mills).

Assay of these compounds for their ability to induce uterine growth in 21-day old mice demonstrated that the 4-hydroxy œstradiol derivative possessed 10 per cent of the oestrogenic potency of oestradiol-17β, whereas the 2-hydroxy oestradiol retained less than 1 per cent of the activity of the unsubstituted oestrogen. Similar results were obtained in ovariectomized adult female rats.

For the *in vitro* tests, uterine horns were removed from adult female rats (Holtzman strain) which had been ovariectomized two months prior to the experiments. After immediate cooling of the tissue in iced Robinson media[1], each horn was opened lengthwise and cut into four equal segments. Twelve segments were selected at random and transferred to iced reaction flasks containing 2 ml. of media. The latter was composed of 0·005 *M* sodium formate-$^{14}$C (0·55 × 10$^{6}$ counts/min. per μmole), 0·005 *M* glycine and 0·022 *M* glucose dissolved in Robinson media. Where indicated, 10 μgm. of a natural oestrogen or a hydroxylated derivative was added to the flask in an ethanol solution and the ethanol evaporated prior to the addition of the reaction mixture. All experiments were conducted in duplicate.

The incubations were carried out in an atmosphere of 100 per cent oxygen at 37·5° C. with constant shaking for a period of 3 hr. The reaction was terminated by the addition of perchloric acid to yield a concentration of 4 per cent. The uterine segments were removed, frozen in liquid air, and pulverized in a stainless steel mortar. This residue was suspended three times in 5 ml. of 10 per cent trichloracetic acid to remove acid-soluble radioactive contaminants. Lipoidal materials were removed by suspension in 70 per cent ethanol, followed by two hot extractions with absolute alcohol (20 min. at 70–75°) and two washes with ether. The nucleic acids were extracted from the protein with 4 per cent perchloric acid at 90° according to the method of LePage[2]. After washing successively with cold perchloric acid, ethanol and ether, the protein residue was spread on tared aluminium disks for counting. The dried samples were counted in gas-flow proportional counters. The results are expressed as counts per minute per milligram of protein residue corrected for self-absorption and counting efficiency.

A comparison of the effects of 2-hydroxy and 4-hydroxy oestradiols with the natural oestrogens, oestradiol, oestrone and oestriol, is illustrated in Table 1. It is apparent that both ring *A* hydroxylated oestradiols stimulate the incorporation of radioactive formate, while the natural oestrogens are essentially inactive.

Table 1

| Addition | Counts/min./mgm. protein |
|---|---|
| None | 224 |
| Oestradiol-17β | 241 |
| Oestriol | 222 |
| Oestrone | 200 |
| 2-Hydroxy oestradiol | 365 |
| 4-Hydroxy oestradiol | 356 |

10 μgm. of a hormone was added per flask.

Hydrolysis of the protein and chromatographic isolation of the serine accounted for approximately 50 per cent of the incorporated radioactivity in all cases; previous studies have shown that methionine also contains a large portion of the radioactivity.

Whether or not this oestrogen-like action of the 2- and 4-hydroxy oestradiols *in vitro* is mediated in the same manner as the *in vivo* stimulation of this system by oestradiol remains to be determined. In any event it appears useful as a tool in duplicating *in vitro* conditions within the tissue achieved by *in vivo* action of the natural hormone.

I thank Mrs. Grace Bowman for valuable techn assistance throughout this work, which was ported by grants from the Alexander and Marg Stewart Trust, the U.S. Public Health Ser (1897-C2) and the American Cancer Society.

## Germanium in Some of the Waste-Products from Coal

IT is well known that many of the trace eleme of coal are enriched in certain of the waste produ such as flue dusts, resulting from the utilization the coal. Crawley[1], and Forrest, Smith and Wa have recently commented on the value of produ of this type as raw materials for the recovery germanium. In the course of work on the behavi of germanium and other trace elements during utilization of coal, we have obtained results sugge ing conclusions rather different from some of concepts implied in the note of Forrest *et al.*

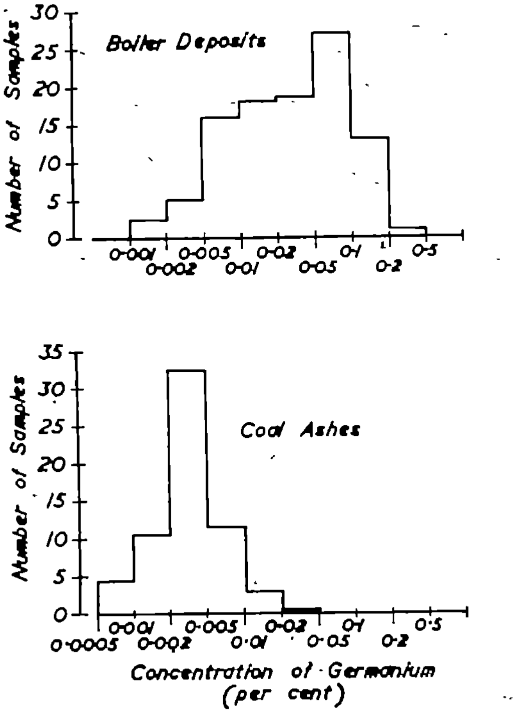
Samples of residual ash from the grates of stok fired boilers have been found to contain only relativ small quantities of germanium, ranging from l than 1 p.p.m. to about 12 p.p.m., with a mean va of about 3 p.p.m. On the other hand, coal samp similar to those being burnt in power stations ha been ashed under laboratory conditions where appreciable loss of germanium occurs, and the me germanium content of these ashes is much greate of the order of 50 p.p.m. It thus appears that duri the combustion of coal in stoker-fired boilers, t greater part of the element is volatilized from t fuel bed. The problem of obtaining germanium-ri material from such a combustion therefore seems be not so much the difficulty of volatilizing t element, as the means of collecting the volatili element at a sufficiently high concentration.

Our results also suggest that germanium is m likely to be incorporated in external boiler depos and flue dusts by the collection, or trapping, of ve small germanium-rich particles than by the co densation *in situ* of a volatile compound. For e ample, analyses of some hundred samples of exter deposits and flue dusts have shown no evidence any consistent fractionation of germanium wi respect to the general position of the deposit in t boiler system (see Table 1).

There is a tendency for deposits from the upp deck of steam-generating tubes to furnish a somewh richer material; but, on average, the deposits fro all regions in the flue system exhibit the same ord of enrichment of germanium. The frequenc

Table 1. AVERAGE ENRICHMENT OF GERMANIUM IN DEPOSITS FR VARIOUS ZONES OF A POWER-STATION BOILER

| Zone | Enrichment factor (relative to coal ash) | Average germaniu content (per cent |
|---|---|---|
| Lower deck steam-generating tubes | 10 | 0·05$_{8}$ |
| Superheater tubes | 10 | 0·05$_{7}$ |
| Upper deck steam-generating tubes | 20 | 0·1$_{1}$ |
| Economisers | 10 | 0·06$_{8}$ |
| Air heaters | 10 | 0·04$_{8}$ |



ig. 1. Frequency-distribution of germanium concentrations in power-station boiler deposits and in coal ash

tribution of the concentration values for these
ndred deposits compared with that for laboratory-
epared ashes from commercial grades of coal shows
similar effect; histograms for these two types of
terial are shown in Fig. 1, and indicate that
actically all the deposit samples show enrichment
their germanium contents, the most frequently
curring, lower, values for coal ash being virtually
represented in deposits. Incorporation of ger-
anium in deposits does not seem, therefore, to be
arkedly selective, and hence is more likely to consist
a physical trapping of solid particles than a
mperature-dependent condensation directly into
e deposit.

More evidence on this point has been obtained in
e examination of dusts taken from the waste-gas
ies of the built-in producers used for heating coal-
rbonization plant. It may fairly be assumed that
similar mechanism of transfer of germanium oper-
es in such plant, although the two cases differ in
at gas velocities are higher in boiler plant than in
ilt-in producer plant. It has been found that the
ry fine dust suspended in the chimney gases of a
ilt-in gas-works producer can contain up to 2 per
nt of germanium, and that this represents an
preciable proportion of the germanium originally
esent in the fuel. The presence of a germanium-
ch suspension, or smoke, in the flue gases resulting
om the high-temperature oxidation of coke appears,
erefore, to be established. A similar condition can
e inferred for stoker-fired furnaces.

It is possible that in power-station boilers the higher
te of gas-flow would decrease the chance of this
ne material being deposited on the flue surfaces,
nd that the proportions of germanium lost to the
tmosphere would be correspondingly greater than
ccurs in gas-works producers. Some of our results
pport this possibility; but the question is being investigated further. This consideration, however, is not likely to be the only reason for the lower concentrations encountered in power-station boiler deposits, as compared with deposits from the waste-gas flues of producer-gas plant. At the Fuel Research Station, maximum concentrations of 0·2 and 3 per cent respectively have been noted for these two types of material. Such differences may be due, in part at least, to different degrees of dilution of germanium by inert fly-ash particles: the higher gas velocity in the power-station boiler might be important in this respect also, by causing a greater deposition of larger ash particles which would of necessity have a relatively high diluting capacity.

This work forms part of the programme of the Fuel Research Board of the Department of Scientific and Industrial Research and is published by permission of the Director of Fuel Research.

## Abnormal Freezing Nuclei in the Atmosphere

Freezing nuclei in the atmosphere are characterized by a critical threshold temperature below which, and only below which, they initiate the freezing of water droplets with which they may be associated. I have devised a simple method of testing whether or not there is at least one freezing nucleus in a given sample of air (about 200 c.c.) which is active at any given temperature; it is similar to that described by me in 1947[1], except that expansions are performed more slowly (lasting about 1 sec., and allowing droplet growth to follow the cooling).

During the past ten years, a very large number of measurements have been made with a similar apparatus in many parts of the world. The general result is that there are few nuclei which have a threshold temperature above − 32° C., but there are a fairly large number of nuclei which are active at this temperature or a little below.

In the winter of 1954–55, similar measurements were carried out in Panama. During the first six weeks these measurements indicated rather few nuclei and those with threshold temperatures about − 32° C. or little lower as found elsewhere. On January 13 a very large number of nuclei (more than $10^5$/m.$^3$) were suddenly found, and these with threshold temperatures as high as − 18° C. Such abundant freezing nuclei, active at this temperature, had never been observed before. These nuclei were continuously present until January 18, when nuclei with a threshold temperature of − 13° C. were found. These nuclei were present for another day, after which the threshold temperature gradually dropped to − 17° C. on January 30, and then there was a secondary maximum with nuclei present having a threshold of − 15° C. Thereafter the threshold gradually decreased until the normal value of − 32° C. was reached on February 17.

Experiments showed that the abnormal nuclei were large, since they were easily stopped by a short cotton-wool filter.

The appearance of the unusual nuclei was accompanied by prolonged, continuous rain, which is abnormal in these latitudes at this season. On January 14 the rain changed to showers; but heavy rain fell on January 17 and 18. The secondary maximum on January 30 was accompanied by many thunderstorms, after which the rains gradually died out.

Aircraft observations indicated that some of these rains were of 'warm' type; thus it appears that though the nuclei have been detected due to their exceptional freezing ability, they can also serve as efficient warm rain nuclei.

At first it was suspected that the abnormal nuclei were residues from the hydrogen bomb explosions, and the results were communicated privately to a number of scientific centres. As a result, Vincent J. Shaefer and Dr. E. G. Bowen reported that they had also found exceptionally heavy ice nucleation on Mount Washington and in Australia respectively on January 13. This apparent world-wide increase in nuclei agrees strikingly with the dates expected from Bowen's[2] meteoritic hypothesis and would seem to confirm it.

It would seem most desirable that regular measurements of ice nuclei having various threshold temperatures and of condensation nuclei should be made at a number of observatories widely distributed over the world, in view of their importance if Bowen's hypothesis is found to be correct.

*Note added in proof.* On May 23, 1955, nuclei with the threshold −13° C. were observed again and were present for two days. These nuclei correspond to the meteoric shower of Lyrids (April 21).

## Isotope Shifts in the Spectrum of Helium

Experiments on various line series in helium[1,2] show that Hughes and Eckart's treatment[3] of the 'specific' isotope shift in this case is inadequate. Their wave functions take no account of configuration interaction, to which the specific effect is very sensitive.

The specific shifts of the $2^1S$, $2^3S$ terms of helium have now been calculated in the usual first-order perturbation treatment, using the wave functions of Hylleraas and Undheim[4] and Huang[5]. These wave functions include configuration interaction in an adequate manner. The constants for the Hylleraas–Undheim triplet function were kindly supplied by Prof. E. A. Hylleraas. The coefficients in their singlet function were calculated from the original data.

The results of the calculations are compared with experiment in Table 1. Some approximations were made in the calculation with the Huang triplet function; but it is estimated that the specific shift is accurate to the two significant figures given in the table. The results disagree with those found by Hamermesh and Eisner using the Huang wave functions and quoted by Fred *et al.*[1]. The experimental values are taken from Bradley and Kuhn[2], who estimated the term shifts by extrapolating the observed shifts of lines $2S$—$nP$ to the series limits. Fred *et al.*[1] found a residual shift of about 0·135 cm.$^{-1}$ for the $2^1S$ state, which agrees well with the value 0·13 cm.$^{-1}$ given by Bradley and Kuhn.

Table 1

| Shift | Term | Wave function | | | Ex |
|---|---|---|---|---|---|
| | | Hughes and Eckart | Huang | Hylleraas and Undheim | |
| $A$ | $2^1S$ | 0 | 0·159 | 0·149 | 0·1 |
| $A$ | $2^3S$ | 0 | 0·076 | 0·0758 | 0·1 |
| $B$ | $2^1S$ | 1·436 | 1·595 | 1·585 | 1· |
| $B$ | $2^3S$ | 1·728 | 1·799 | 1·799 | 1· |

$A$ = total term-shift minus normal term-shift (cm.$^{-1}$).
$B$ = total term-shift (cm.$^{-1}$).

The total term-shifts obtained from the calculat are all close to the experimental values. It is c cluded that nuclear motion makes by far the m important contribution to isotope shift in heli Further details will be published elsewhere.

I wish to thank Dr. H. Kuhn and Dr. J. A. Sp for their interest in this work. I am indebted to Department of Scientific and Industrial Research a maintenance grant.

## Time Interval between Nucleogenesis and the Formation of Meteorites

While determining the radiogenic argon-40 conte of the Beardsley chondritic meteorite[1], a mass spect metric search for xenon-129 produced by decay iodine-129 was made. The total amount of xen which was observed was 5 × $10^{-9}$ c.c. (s.t.p.) fr a 29·86-gm. meteorite sample. Within the limits experimental error, this xenon had a normal isoto composition[2]. The ratio of xenon to argon-36 w in essential agreement with that found in air, dicating that this xenon was due to atmospheric co tamination. Since a 30 per cent increase in t abundance of xenon-129 over that observed in norm xenon would have been observable, this indicat that radiogenic xenon-129 was present in th meteorite to less than 1·3 × $10^{-11}$ c.c. (s.t.p.)/g H. E. Suess and M. G. Inghram (personal communic tion) have suggested that if the meteorites had be formed soon after the formation of the element they would contain an excess of xenon-129 due decay of iodine-129.

A lower limit for the time-interval $t$ between t formation of the elements and the last crystallizati of the meteorites may be calculated by assumi that iodine-129 and iodine-127 were originally ma in equal abundance, and that there has been no lo of xenon due to diffusion since the meteorite w last crystallized. The iodine-127 content is take to be 1 p.p.m. by weight, based on the values reporte by Fellenberg[3] for other stony meteorites. Th equation for $t$ is

$$t = \frac{T_{1/2}}{0{\cdot}693} \ln \frac{^{129}\mathrm{I}}{^{129}\mathrm{Xe}}$$

where $T_{1/2}$ is the half-life of iodine-129, $^{129}$I is th amount of iodine-129 originally formed and $^{129}$Xe the amount of xenon-129 now present in th meteorite due to the decay of iodine-129.

from the limit of detectability presented above, may conclude that $t/T_{1/2} > 23{\cdot}7$. Using the ue[4] of $1{\cdot}7 \times 10^7$ yr. for $T_{1/2}$, we obtain $t > 0{\cdot}41 \times$ yr. I. Noddack and W. Noddack reported a value $\cdot5 \times 10^{-2}$ p.p.m. by weight of iodine in meteorites[5]. is value is considerably lower than that reported Fellenberg. It is very doubtful whether the iodine tent of meteorites is any lower than the value of $\times 10^{-2}$ p.p.m. reported by the Noddacks. Using s lower value, we obtain $t/T_{1/2} > 17{\cdot}4$. It is clear t this calculation is very insensitive to such a nge in the iodine abundance. The critical effect of course, that of xenon diffusion. H. C. Urey rsonal communication) has pointed out that the line in stony meteorites may be bound on the surces of the mineral grains, and hence, the loss of non by diffusion might be greatly facilitated. This ect would cause the calculated lower limit for $t$ to too large.

The $^{40}$A—$^{40}$K age reported for the Beardsley teorite is $4{\cdot}8 \pm 0{\cdot}2 \times 10^9$ yr.[1]; thus, a lower it of $5{\cdot}0 \times 10^9$ yr. for the time since the formation the elements is obtained.

If the assumptions mentioned above are valid, and the Earth and the meteorites are cogenetic, all radioactive elements with half-lives short comred to $4 \times 10^9$ yr. would have decayed in the ne interval between nucleogenesis and the forman of the Earth and would, therefore, not contribute the heating of the primeval Earth.

We thank Prof. M. G. Inghram and Prof. H. C. rey for several stimulating discussions. This work s performed in part under the auspices of the .S. Atomic Energy Commission.

## Distribution-in-Speed of Fading of 150-kc./s. Waves

A CONSIDERABLE amount of work has been done the 'speed of fading' of radio waves[1-5]. This antity, often referred to as $v_\tau$, denotes the change the amplitude in a certain time, $\tau$, expressed as fraction of the root mean square amplitude of e wave. The first-order theory indicates that the stribution-in-speed should be a normal one reprentable by:

$$p(v_\tau) = \frac{\exp(-v_\tau^2/4\varepsilon)}{\sqrt{4\pi\varepsilon}}$$

It has, however, been pointed out[4,5] that, if the lag used for the computation of $v_\tau$ be large, the firstder theory breaks down and the distribution sumes a form:

$$p(v_\tau) = \frac{\exp(-v_\tau^2/4\varepsilon)}{\sqrt{4\pi\varepsilon}}\,\varphi(\varepsilon_1 v_\tau)$$

where $\varphi$ is a monotonically decreasing function of $v_\tau$, the rate of decrease depending on the parameter $\varepsilon$. This leads to a distribution narrower than normal, which we will denote as the modified Gaussian distribution.

The value of the lag $\tau$ for which the breakdown becomes appreciable is greater the smaller the frequency of the radio wave. Hence it can be expected that the deviation from the normal form of the distribution will be evident more readily at higher frequencies than at lower frequencies.

Workers at Cambridge[2,3], using short waves, found distributions significantly narrower than normal. An extension of the analysis to lower frequencies has been made by us at the Pennsylvania State University, using the fading of 150 kc./s. waves. The slow rate of fading of these waves made it necessary for us to use much larger time lags than those used by the Cambridge School. However, no significant deviation from normality has been found. Fig. 1 indicates a typical distribution-in-speed. We have superposed the corresponding normal and modified Gaussian distributions on the histogram. It will be seen how the histogram is statistically indistinguishable from the normal. Also, the expected theoretical deviation is so small that a statistical distinction would not be possible. This seems to bear out the previous prediction that the similarity to the normal distribution would be more pronounced with long waves than with short waves.

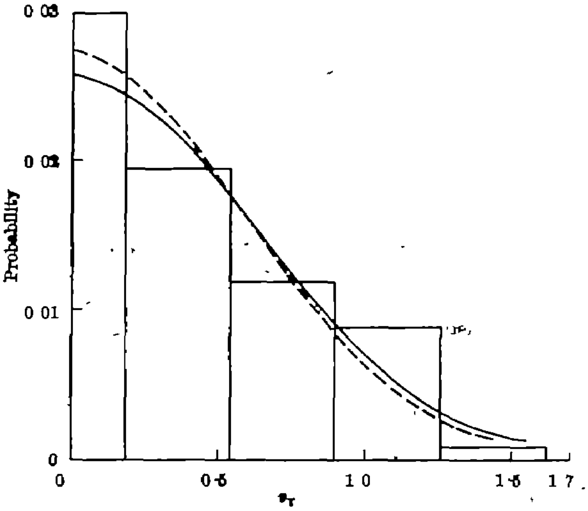

Fig. 1. Histogram for speed of fading with a lag of 20 sec. on March 8, 1952, at 0000. The normal distribution with $\varepsilon = 0{\cdot}19$ is shown superposed as a solid line. The dotted line shows the modified Gaussian distribution

# FORTHCOMING EVENTS

### Sunday, July 17—Friday, July 22

University of London (at Wye College, near Ashford, Kent)—Third International Conference on "Plant Growth Substances".

### Monday, July 18—Saturday, July 23

International Association of Applied Psychology (in the Beveridge Hall of the Senate House of the University of London, and Birkbeck College, Malet Street, London, W.C.1)—12th Congress.

### Tuesday, July 19—Friday, July 22

Association of Applied Biologists (at Oxford)—Summer Meeting.

### Thursday, July 21

Royal Society of Tropical Medicine and Hygiene (at the Hospital for Tropical Diseases, 4 St. Pancras Way, London, N.W.1), at 7.30 p.m.—Clinical Meeting. Chairman: Prof. R. M. Gordon, O.B.E.

### Thursday, July 21—Saturday, July 23

Royal Meteorological Society (at Ashburne Hall, University of Manchester, Fallowfield, Manchester)—Symposia on "Some Aspects of Turbulence in the Atmosphere" and "Oceanographic Topics".

### Saturday, July 23

Association of Clinical Biochemists, Southern Region (at the Central Laboratory, Milton Road, Portsmouth), at 11 a.m.—Scientific Papers and Demonstrations.

### Saturday, July 23—Sunday, July 24

British Psychological Society, Northern Branch (at the University College of North Staffordshire, Keele, Stoke-on-Trent, Staffs)—Scientific Papers.

# APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Lecturer in Chemistry at the College of Further Education, Grimsby—The Director of Education, Education Office, Eleanor Street, Grimsby (July 23).

Tutorial Student in Theoretical Physics—The Secretary, Birkbeck College, Malet Street, London, W.C.1 (July 23).

Lecturers (2) in Electrical Engineering—The Secretary of University Court, The University, Glasgow (July 25).

Assistant Lecturer or Lecturer (with qualifications in physical and inorganic chemistry) in Chemistry—The Registrar, The University, Hull (July 30).

Assistant (preferably with qualifications in physical geography) in Geography—Joint Clerk to the University Court, Queen's College, Dundee (July 30).

Chair of Mathematics at University College, Ibadan, Nigeria—The Secretary, Inter-University Council for Higher Education Overseas, 1 Gordon Square, London, W.C.1 (July 30).

Lecturer or Assistant Lecturer in Botany—The Registrar, The University, Birmingham (July 30).

Scientific Officer (with a first- or second-class honours degree in engineering or applied science with a knowledge of soil mechanics, or equivalent qualifications) at the Road Research Laboratory (D.S.I.R.), Harmondsworth, Middlesex, to act as Assistant to the Colonial Road Research Liaison Officer, and visit Colonial territories to assess road problems suitable for research, advise on road works, disseminate information and answer inquiries, and undertake research into problems relating to Colonial roads—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting E.378/5/A (July 30).

Assistant Professor or Professor in Mathematics, and an Assistant Professor in Physics, at the Higher Teachers' College, Baghdad, Iraq—The Cultural Attaché, Iraqi Embassy, 22 Queen's Gate, London, S.W.7 (July 31).

Lecturer or Assistant Lecturer in Mathematical Statistics in the Department of Applied Mathematics—The Registrar, The University, Liverpool (August 8).

Lecturer (with a university degree or equivalent qualification, and preferably some teaching and industrial experience) at the Ministry of Supply School of Electronics, to teach electronics and mathematics to H.N.C. standard—The Principal, School of Electronics (Ministry of Supply), Malvern, Worcs (August 8).

Research Assistant (with experience in practical microscopy) in the Department of Metallurgy—The Registrar, The University, Manchester (August 8).

Lecturer in Education at the University of Otago, Dunedin, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (New Zealand, August 12).

Lecturer (with qualifications in chemistry or biochemistry and a wide experience in the biochemistry of steroids) in Pathological Biochemistry at the Royal Infirmary—Secretary of University Court, The University, Glasgow (August 13).

Lecturer in Applied Mathematics at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, August 15).

Senior Lecturer in Zoology at the University of Sydney, Aust —The Secretary, Association of Universities of the British Comm wealth, 36 Gordon Square, London, W.C.1 (Australia, August 15

Lecturer (preferably with special qualifications in micro- semi-micro analytical techniques) in Chemistry—The Secretary, University, Aberdeen (August 20).

Lecturer (with special qualifications in physical chemistry) Chemistry—The Secretary, The University, Aberdeen (August 20

Lecturer in Philosophy at the University of Melbourne, tralia—The Secretary, Association of Universities of the Bri Commonwealth, 36 Gordon Square, London, W.C.1 (Austr September 5).

Deputy Director (with high academic qualifications and rese experience in one or more of the cognate sciences: biochemis chemistry or pedology, together with administrative ability)— Secretary, Macaulay Institute for Soil Research, Craigiebuck Aberdeen (September 15).

Chemist (with at least H.S.C. in science subjects, or equival qualifications, and preferably experience with thermal diffusion, B heaters and radioactive gases), to work in gas handling with vacuum apparatus—Establishment Officer, United Kingdom Ato Energy Authority, Atomic Energy Research Establishment, Harw Didcot, Berks, quoting 2/103/353.

Demonstrator (with qualifications in bacteriology and an inte in the physiology of bacteria) in the Department of Botan The Registrar, The University, Nottingham.

# SOCIAL IMPLICATIONS OF AUTOMATIC CONTROL IN INDUSTRY

HE broadsheet "Towards the Automatic Fac-
tory", issued by Political and Economic Planning
. 380; June 13, 1955), appeared almost simul-
ieously with a conference at Margate, June 17–19,
anged by the Institution of Production Engineers,
ich has given wide currency in Britain to the term
tomation', coined by the Americans to cover
velopments towards automatic operation and
ntrol. This conference, which was the first expert
thering in Britain to approach the subject com-
hensively and systematically, was attended by
re than a thousand engineers, scientists and factory
nagers, and both the broadsheet and the con-
ence have done something to clarify ideas as to the
tinction between mechanization and 'automation',
d also to indicate both the practical possibilities
d the limitations of the automatic factory, and the
man, as well as the technical, problems that are
volved. They indicate the possibilities which the
pid technological developments of the post-war
ars have opened up and something of the impli-
tions not merely for industry, but also for science,
education and for society in general.

'Automation' was defined by R. K. Geiser at a
nference on automation and industrial develop-
nt at Syracuse, New York, in May 1954, as "the
complishment of a job by an integrated mechanism
th a minimum of assistance of any kind". Full
tomation, in this sense, does not yet exist, though
may be achieved in a suitable industry before the
d of this century. Any technical development that
ables a machine or instrument to dispense with
bour is a step in this direction; but whereas
chanization has largely displaced physical effort,
e new developments are making automatic some of
e work that was formerly done by the human
ains. The real distinction, the broadsheet points
t, is between automation that displaces muscle and
tomation that displaces brain, and it is roughly the
me distinction as that between automatic operation
d automatic control.

The industrial revolution of the nineteenth century
s a change towards automatic operation; but
chanization was limited to individual processes,
d only in a few suitable trades was it possible to
ovide automatic links between processes and
ganized production as a continuous flow. Not until
e twentieth century was the idea of producing
ods in a continuous flow rather than in batches
dely applied, and then at first it was confined to
dustries in which the movement of materials is
raightforward. By the 1920's, some automatic
struments were introduced into most processing
dustries, and since 1945 the rate of change to auto-
ation has quickened, partly because of technical
velopment during the Second World War and
rtly under the stimulus of the shortage of labour.
Of these developments two are outstanding: the
chanization of the handling of materials in factories by new devices such as fork-lift trucks, and the introduction of transfer machines which perform two or more operations and automatically pass materials from one to the next. The developments in automatic operation, however, while extending the area of application, particularly to the transfer and handling of materials, are not revolutionary but part of a well-established trend. Those in automatic control have been considerably more drastic, and arise largely from the recent and sudden application of electronic methods of control, although electro-mechanical, pneumatic and hydraulic as well as electronic devices have also contributed. The electronic devices, however, are rapidly gaining in importance and hold out exceptional promise for development in the future.

These devices can plan and control the operation of a machine tool with high precision. They can detect faults in a processed part, and by means of a closed-loop circuit (known as 'feed-back') can communicate the error to the machine and adjust its operation so as to correct the fault. They can integrate the work of individual machines, and the more complex devices can select alternative courses of action according to the instructions fed into them, while finally the possibilities of remote control are extended.

The ability of new devices to detect, communicate and control can greatly reduce the amount of routine brainwork performed in factories, and it is the prospect of rapid technological advance reducing the part played by human labour in the factory to skilled supervision and maintenance that is responsible for excitement about the possibilities of automation. Both the broadsheet and the conference at Margate should dispel any illusions as to the pace with which automation is likely to speed. Not only is much more hard work required before automation becomes general, apart from the limitations set by the availability of the machine tools or the trained engineers required; but also automation has already gone a long way and the number of industrial processes that are ripe for it is limited. More important still, rapid progress with automation depends on complex economic factors to which little thought has yet been given.

It is these economic problems and the social and human implications that require most consideration, and the conference and the broadsheet help to balance and counteract some of the more sensational pictures of the robot factory which have received currency. It is true that, as PEP notes, generally speaking, automation presents no economic problem that has not been created already by the mechanization of processes. There is no conclusive evidence that automatic devices are much more costly to buy than most non-automatic machines; but automation nearly always calls for a large initial outlay and for major changes in production planning.

Computers, for example, have two main advantages: a 'memory' which stores a very large number of facts and gives access to them, or makes computations with them, much faster than is possible with a punched-card system; and secondly, the possibility of automatic links with other office machines, which enable the computer to control the operation of these machines and the passage of information from one machine to another. Continuous research and experiment with computers may make possible all manner of improvements in factory and office methods that so far have been precluded by the inability of human brains to compute the data fast enough or extensively enough. At the same time, it may well be found that the potential saving of labour is limited to firms with large staffs engaged on lengthy mathematical routines. Medium and small firms are scarcely likely to adopt automatic techniques much faster than at present, unless capital costs are greatly reduced by simplification, standardization and other means.

A second problem concerns labour and productivity. As the broadsheet remarks, the post-war trend towards automation would have been much less pronounced but for full employment and the high cost of labour. According to the report of the Committee on Economic and Financial Problems of the Provision for Old Age, the British labour force can be expected to increase only from 23·3 million in 1954 to 24·4 million in 1979. Any substantial increase in living standards must therefore arise from higher productivity, and if the Chancellor of the Exchequer is right in his forecast that the standard of living in Britain can be doubled in that period, the gross national production must be raised by 110 per cent, or allowing for a 10 per cent reduction in working hours, by 123 per cent per man-hour, or 3 per cent a year compared with the present 2·3 per cent and a best long-run increase of only 1·5 per cent a year. If Britain embarks on rapid economic expansion, only a very rapid increase in productivity can avert an acute shortage of labour.

Leaving for the moment the disturbing evidence of the recent strikes that the trade unions are, to say the least, reluctant to face the implications and are looking backwards rather than forwards, the adoption of automatic operation and control may be retarded not merely by hesitancy on the part of firms to invest capital in machinery and equipment which will not be fully or efficiently used, but still more by the shortage of scientists, engineers and technicians competent to undertake the research, design and development that automation will need and will make possible. It was stated at the open day on June 24 of the Culcheth Laboratory of the Atomic Energy Authority that at present the Authority has on its staff only one-tenth of the scientists it needs competent to take charge of a research programme involving direction of the work of a dozen or more juniors. Recruitment for the junior grades is easier, and the director of the Research and Development Section, Mr. L. Rotherham, believes that the difficulty will disappear after some years as existing staff acquire experience.

That, however, is only one example of a short of scientists and technologists which is believed to already hindering the full development of our ind trial capacity and which may well be intensified a continued increase in automation. Since the tc population and the labour force of Britain will rem fairly constant, the quantity and variety of scient and technological skill in the country can only increased if a much higher proportion of you people qualify in that way than at present. Ap from the diversion of interest among suitable you men and women, this implies an immediate expans of training facilities, making a heavier demand wh shortage is already most acute—in teachers of scien

That is one aspect which makes the question science teachers and the expansion of technologi and technical education in Britain matters of natio policy to which the Government should be giving first priority. Unless this is done, and unless it done in balance with the expansion of secondary a university education, it is improbable that there w be in the foreseeable future an adequate supp either of newly trained scientists and technologi for such exacting and specialized work, or of tec nicians and operators generally of the flexibility a adaptability necessary to ensure that full use made of the services of the more highly train scientist and technologist.

Automation thus raises the question of educati for an era of technological change in the broad possible context, from that of general education that of the highly specialized scientist or technologi from the school to the university or institute technology, and from the manager to the operat Nor should the implications in respect of leisure a its use be overlooked. As already noted, increas productivity is likely to be accompanied by increase in leisure, and this can only be detriment to a community that is unprepared or unable make profitable use of that leisure.

No less acute are the problems raised in respect power. The increase in the consumption of pow results chiefly from replacing human energy machinery, and automatic devices will not direct add much to the demand for power. Indirectl however, like other means of increasing productivit they force up the demand for power because th enable the same labour force to produce more goo Moreover, until nuclear power contributes appreciab to total energy supplies, industrial expansion c only be rapid if supported by large imports of co and oil; this has been emphasized in the nin annual report of the National Coal Board, and confirmed by the decision of the Central Electrici Authority to convert seven of its power stations fr coal- to oil-firing and by the warnings given by Claud Gibb and Mr. J. Eccles at the British Electric Power Convention on June 29.

Here again we are dependent to some extent the supply of scientists and technologists, for if imports are seriously expanded, domestic refine capacity must be expanded accordingly, with concomitant demand for technicians and techi sts. The over-riding human problems, however, those of management and labour. Automation severely test the flexibility of modern manage- it and will involve radical changes in attitude to blems of production engineering and factory lay- . There were, indeed, no more promising features the Margate conference than the awareness of ineers there of the social implications and of their cern to minimize any strain which the change- r might involve for the work-people.

ir Walter Puckey in his opening address to the ference suggested that work-people would be ter off and anticipated no considerable unemploy- nt: more skilled workers would be needed, and ) better facilities for technological education and nore effective application of scientific innovations industry. He emphasized, however, that more cibility would be required and greater readiness move from unskilled to skilled occupations. Mr. C. Woolland and Lord Halsbury were also re- uring on the point of unemployment; but Lord lsbury was concerned about possible misfits, and of. B. R. Williams stressed once more the import- e of education, urging that our present educational ilities are inadequate.

iven, however, this sense of social responsibility the part of management, scientist and techno- ist, what of the attitude of labour? Here the ference was a little more hopeful than the recent f-yearly report from the General Council of the des Union Congress to the Unions, which has ely begun to face the issues. Mr. Eric Fletcher ite rightly emphasized the need for giving the de unions full and early information of impending nges, and said that "the Trade Union Congress uld co-operate if there was a background of good tions, consultation and redundancy procedures, luding control of intakes". Re-training, he said, a responsibility of management. Apart from ognizing that an increasing amount of shift-work l be necessary, however, Mr. Fletcher gave little lication that the trade unions are thinking deeply out what contribution they can make to a common oblem, and how far their own restrictive practices archaic methods may prevent the community joying the full benefit of the new potentialities.

Redundancy, or rather the threat of it, is almost tainly the main cause of alarm and hesitancy iong the trade unions, although, as PEP points t, the facts do not suggest there will be serious employment. More than half the British labour rce is engaged in construction, agriculture, mining, stribution, personal services or self-employed cupations, which are unlikely to become highly tomatic in the near future. Local unemployment, wever, may well occur, depending on the speed of chnical change; and if, as is probable, the change mes slowly, the problem may be solved by slowing wn recruitment. National policy, too, could help scheduling the towns affected as development eas, by persuading firms short of labour to set up anches there and by fostering re-training schemes id greater mobility of labour.

The decisive factor, however, may well prove to be the attitude of the trade unions. It may involve not only open-mindedness to automation and a readiness to recognize the benefits it can bring to labour itself, but also less rigidity to changes in union structure and relations. Apart from the effect of migration of labour to service trades from the general and industrial unions, new unions may perhaps be required to meet the needs of new types of worker. Apart from this, wage-structures are likely to be outdated by automation, and the question of differentials between skilled and unskilled labour could well become acute.

The crucial issues, as PEP emphasizes, are in fact likely to be economic, social and administrative rather than technical; but the key to the solution of all the major problems is in education. In the unions no less than in management, there must be a readiness to look at the problems and issues not from a sectional point of view but from that of the public interest, and to look forward rather than backward. If they are faced responsibly by both sides and there is readiness to work together constructively, discarding obsolete and restrictive practices no longer appropriate in the social welfare State or consonant with the prospect that automatic methods and controls offer the community, the change may well be made without serious unemployment or creating dissatisfaction among the workers.

Clear understanding of the problems on all sides is essential, and the Margate conference should only be a prelude to further discussions and to more carefully planned research. The Department of Scientific and Industrial Research is already collecting information and assessing trends over a wide field of industrial activity, and the report on its findings will be eagerly awaited. Its joint committee with the Medical Research Council, on Human Relations in Industry, has sponsored a small pilot research project in the University of Cambridge into some human and social aspects of introducing automatic control techniques into industry. With this research, however, should go also interpretation and constructive thinking about the many complex issues involved, so that the way may be prepared for effective, enlightened and responsible action. That is a task in which many scientists who are alive to the implications of scientific advance for industry and society could well share.

Meteor Astronomy

By A. C. B. Lovell. (International Series of Monographs on Physics.) Pp. xiv+463+8 plates. (Oxford: Clarendon Press; London: Oxford University Press, 1954.) 60s. net.

THE derivation of precise information of meteor paths and velocities by direct visual observation is a task rendered peculiarly difficult by the transient nature and feeble brightness of the luminous paths produced by meteors as they enter the earth's upper atmosphere. Except during the major meteor showers, comparatively few meteors can be seen per hour in the clear night sky. It is much to the credit of the visual observers that so much should have been learnt in past years of the characteristics of meteors. It is also understandable, with the uncertainties of visual observations and the difficulties of analysis, that controversy should have arisen about the celestial mechanics of meteors.

The mainspring of dispute has been concerned with the sporadic meteors which continue their activity throughout the year. If these meteors move in orbits within the solar system, their velocities at the distance of the earth from the sun must not exceed 42 km./sec., at which limiting velocity the orbits become parabolic; if the velocities are higher, the orbits are hyperbolic and interstellar origin is indicated. There has long appeared to be evidence favouring hyperbolic velocities and culminating in the Harvard–Cornell meteor expedition in Arizona during 1931–33, which led Öpik to infer that at least 60 per cent of sporadic meteors have velocities in excess of the parabolic limit. The evidence has been criticized on the grounds that the observational data were too uncertain, and Prentice and Porter concluded from British meteor data that very few meteors have hyperbolic velocities.

Whereas it might well have been forecast before the Second World War that photographic methods, which had hitherto lacked sensitivity, might be so improved as to provide an important means of obtaining precise data, a result which is now being achieved by Whipple and others at Harvard with the aid of super-Schmidt cameras, it could scarcely have been foretold that the most striking advance would come from radio. Although the meteoric origin of spasmodic increases in ionospheric reflexions had long been suspected, it was the development of radar during the War which enabled Hey and Stewart to prove conclusively that the short-duration echoes seen on long-range radar at metre wave-lengths were from the ionized trails of meteors. Since then, tremendous progress has been made in this field by Prof. A. C. B. Lovell and his group at the University of Manchester. Important contributions have also come from McKinley and Millman in Canada. The radio methods have a great advantage in that observations are unrestricted by weather or daylight. The ascendency of radio techniques could not be more clearly demonstrated than by the fact that Prof. Lovell should be the author of this new book on the measurement of the paths, velocities and mass distribution of meteors, and the derivation of their orbits.

After introductory chapters describing observational principles, Prof. Lovell sets his account of the impact of radio methods on meteor astronomy in the first half of the book against the background of the sporadic meteor problem. The various stages of the controversy are described, with details of methods of analysis and numerous tables from the original papers. Prof. Lovell leads up to recent visual and photographic work and the extensive radio data which have confirmed that very few meteor velocities exceed the parabolic limit. It is feasible that a few may acquire hyperbolic velocities as a consequence of planetary perturbations. It is now almost generally accepted that sporadic meteor orbits are within the solar system.

The second half of the book deals with the less controversial topic of the major meteor showers. It is thirty years since the publication of Olivier's "Meteors", and not only has much new material from direct visual observations since been obtained, l also recent radio and photographic data have grea refined the determination of meteor stream orb: Only the radio method is capable of detecting d time meteors, and a most notable discovery has b the exceptional summer daytime activity. Pr Lovell's concluding chapters deal with theoreti work on the dispersive influences of planetary p turbations, and cosmological problems of the ori of meteors and the relation between the orbits meteors and comets.

Prof. Lovell's book is a comprehensive up-to-d account of meteor astronomy. Parts of it are ı easy reading; this is largely because the author l included much of the analysis of the original pap in condensed form. The book is clearly set ou there is no difficulty in following the general ar ment, and one can return later to particular sectic for detailed study. As in other branches of scien progress is rapid and there is a profusion of publish work. In these circumstances there is much ne to have available surveys which co-ordinate pa achievements. Especially where there is controver is it necessary to put the differing views into p spective. The book admirably fulfils this requiremei

## CAMBRIDGE MONOGRAPHS IN EXPERIMENTAL BIOLOGY

### The Physiology of Insect Metamorphosis

By Prof. V. B. Wigglesworth. (Cambridge Mon graphs in Experimental Biology—No. 1.) Pp. viii 152+4 plates. (Cambridge: At the Universit Press, 1954.) 12*s*. 6*d*. net.

### The Genetics of *Paramecium aurelia*

By G. H. Beale. (Cambridge Monographs in Exper mental Biology—No. 2.) Pp. xi+179. (Cambridg At the University Press, 1954.) 12*s*. 6*d*. net.

THESE two little books are timely, readabl scientifically apt and of just the right length f those who want to know what is going on in a fiel without being fuddled with technical details. Bo authors and editors are to be congratulated on t excellence of these first two volumes of a new seri of monographs.

Prof. V. B. Wigglesworth's book contains an intr ductory chapter on polymorphism and metamo phosis, followed by three chapters on histologic changes during moulting and metamorphosis; th physiology of growth and moulting; and th physiology of metamorphosis. The concludin chapter is on differentiation and polymorphism The approach to metamorphosis is made mainly b a lucid analysis of the humoral mechanisms involve The hormones "release, control and direct" the in herent capacities of the cells of the tissues, and ult mate understanding of the nature of metamorphos must depend upon an understanding of the cellula substrate upon which these hormones act. Thi matrix may perhaps be regarded as a cytoskeleto which may to some extent be continuous even a the supracellular level. Polymorphism is due t alternative reactions of this substrate to alternativ humoral (or other) stimuli, and metamorphosis i regarded as a special case of polymorphism.

Dr. G. H. Beale's introductory chapter is concerned with the general importance of nuclear an plasmic inheritance. He goes on to present ain characteristics of *Paramecium aurelia* which important from a genetical point of view. He describes successively the data on 'killer' and sitive' stocks, on the antigens of paramecium on mating types. His concluding discussion is *attempt* to evaluate the general importance of eritance which is not due to chromosome genes. subject-matter of the book arises mainly from work of T. Sonneborn, and Dr. Beale's own estigations have greatly illuminated the genetical blems.

Among the many interesting phenomena, none eeds in importance the observation that, with a en set of nuclear genes, alternative sets of surface igens may exist. These sets are mutually exclusive, that only one set may be found in any given ividual. Which set does exist depends upon the vious history and present environment of the mal.

The subject-matter of these two books is quite ferent; the authors mention neither one another one another's most favoured research material. t despite this, both books are important con- butions to the general problem of differentiation d modulation. They will be of great interest not y to entomologists and to geneticists, but also to biologists who are interested in the controlling chanisms which determine the characteristics of imals.

# PLANT GROWTH REGULATORS IN AMERICAN AGRICULTURE

ant Regulators in Agriculture

dited by H. B. Tukey. Pp. x+269. (New York: hn Wiley and Sons, Inc.; London: Chapman and all, Ltd., 1954.) 44*s*. net.

THIS book is in effect a symposium, written by a panel of experts, "for the many who have been zzled . . . at their seeming inability to grasp the nificance of plant growth regulators, what they e, how they operate and where they belong in riculture". Only the last-named point has been tisfactorily and consistently covered by this book that is, their place in agriculture. Thus the very ide range of practical application of those synthetic rganic chemicals, now unfortunately come to be nown almost universally as plant growth 'regulators', as been thoroughly surveyed and our knowledge rought up to date. Comprehensive as this review ay be for the American farmer and fruit-grower, its ppeal outside the American Continent will be more mited, since little attention is paid to problems om other parts of the world. Thus only one page ut of the 224 of text is devoted to weed control in mall-grain cereals—a major interest of European rmers. Its value for the non-American is further ffset by the exclusive use, in some chapters, of the ommon American name for crop plants. Thus snap bean" would mean so much more to a European its botanical name were appended.

An exposition of the biological significance and ode of action of plant 'regulators' is only spas- odically attempted, despite three somewhat 'bitty' ntroductory chapters which set out elementary facts nd general principles. The consequent confusion the mind of the layman will not be helped by the fact that the whole polyglot collection of physiologically active compounds are only too frequently considered purely in relation to the general growth symptoms they cause in the plant, and with little regard to the wide diversity of their fundamental actions in the cell. After all, both influenza and a brick on the head will cause a headache.

The main deficiency of this book is therefore the absence of a unifying theme, and this arises from the symposium technique of writing a book. However well meaning an editor may be, it will be difficult for him, short of rewriting whole sections of text, to mould difficult subject-matter such as this into a connected story and to eliminate the overlaps arising between articles of writers with competing interests. It is to be regretted that many of these overlaps were not avoided by allowing the whole of a given field of application to be covered by one author instead of sharing it out between a number of narrow specialists. Some of the contributors have produced excellent articles fulfilling completely the aims set out for the book as a whole. Chapters of this kind are those on parthenocarpy and fruit development in relation to plant regulators; abscission and plant regulators; and plant regulators for weed control in the tropics. Fewer contributions of this quality, each covering one major aspect of plant growth control, would have yielded a much better book.

A final chapter, dealing exclusively with apparatus for the application of chemical growth regulators, will be of considerable interest, although its direct value to the user outside America will depend on the type of equipment available in his country. The book is well produced, and there are many excellent photographic and line illustrations and tables giving details of plant responses to specific regulator treatments in America.

# AMERICAN EPHEMERIS AND NAUTICAL ALMANAC

The American Ephemeris and Nautical Almanac for the Year 1956

Pp. xvii+644. (Washington, D.C.: Government Printing Office, 1954.) 4 dollars.

THIS issue for 1956 of the "American Ephemeris and Nautical Almanac" follows its usual method of arrangement and is in many respects identical with that of the "Nautical Almanac" published in Great Britain. But in other ways it differs from its British counterpart in contents and also arrangement. A few of the points of difference may be noted here.

The American work gives the heliocentric longitude and latitude for all the planets, whereas the British one gives those for Mercury only; the former is a decided advantage, especially for those who have not got a copy of "Planetary Coordinates". The Besselian elements of the eclipses of the sun are given to the fifth significant decimal in the "Nautical Almanac", which is regarded as sufficiently accurate for computational purposes, but the "American Ephemeris" has seven significant figures; the last two figures can have little or no meaning, but this number has appeared for a long time. The same thing applies in other cases; for example, in mean places of stars, both in right ascension and declension, two extra figures are given by the "American Ephemeris" in the seconds. Under sunrise, sunset and twilight, it supplies the times for each five days, the latitudes corresponding with those of the 'Nautical Almanac', but the latter supplies the times for each day, which is a considerable advantage. In addition, for the southern hemisphere, the "American Ephemeris" gives a table with corrections to apply for the corresponding latitude in the northern hemisphere for a date about six months earlier or later. There is a certain amount of inconvenience in turning back the pages for references and, on the whole, the British scheme, while occupying more space, has the advantage of simplicity. Under phenomena, opposition, conjunctions, etc., of planets, the "American Ephemeris" gives the information in a very convenient form by using the symbols for the planets and also for oppositions, conjunction, etc.; but this system does not readily lend itself to showing in tabular form the conjunctions of planets with bright stars, which occupies about half a page in the 'Nautical Almanac".

The list of active observatories, which was discontinued in the "Nautical Almanac" after 1941, has been resumed in the 1955 issue, and includes 225 active observatories, but in general is restricted to those observatories the accurate positions of which are required for reduction of observations. The American list contains 223 active and 90 inactive observatories, but includes also the names of many observatories which do not appear in the "Nautical Almanac"—likewise the latter has the names of many observatories which do not appear in the "American Ephemeris". For this reason, each publication may be regarded as complementary to the other with regard to names of the observatories throughout the world.

# LAURENTIAN HORMONE CONFERENCE, 1953

## Recent Progress in Hormone Research

The Proceedings of the Laurentian Hormone Conference. Edited by Gregory Pincus. Volume 10. Pp. viii+511. (New York: Academic Press, Inc.; London: Academic Books, Ltd., 1954.) 9.80 dollars.

THE Laurentian Hormone Conference, inaugurated in 1943, continues to provide a forum for the discussion of current endocrinological research. Vol. 10 of its proceedings gives an account of the meeting that took place in September 1953, and deals with six main subjects: the interaction of neural and hormonal mechanisms; thyroid hormone; comparative endocrinology; protein hormone (in particular, insulin and corticotrophin); the influence of hormones on blood formation; and clinical endocrinology. This is a very wide field for one conference, and the fourteen reports which were prepared as opening papers will not appeal equally to all research workers.

Invertebrate endocrinology was the only topic completely new to the Conference. Here Dr. D. Bodenstein presented a useful review of endocrine mechanisms in insects, and the discussion it stimulated led directly into a paper by Ernst and Berta Scharrer on the hormones produced by neurosecretory cells. This subject is one of the growing-points of comparative endocrinology. By neurosecretion is meant the release by nerve cells of substances in aggregates large enough to be visible in supravital preparations at moderate magnifications. Much evidence, part histological, part experimental, now indicates t the neurons of the hypothalamic nuclei supraopti and paraventricularis secrete the hormones that to now have been regarded as the product of posterior lobe of the pituitary gland. The Schar regard the latter as a storage organ, and they a note that the fibres which transmit the neu secretory material from the hypothalamus to posterior lobe come into contact with the prim capillary loops of the vessels through which anterior pituitary receives its blood supply. Acco ingly, they suggest that the neurosecretory substan which is the visible counterpart of the active princi of the posterior lobe, might also be responsible the chemical control of the secretion of the anter lobe.

This paper stimulated an interesting discussi Dr. M. Vogt suggested that, while the hypothalam nuclei may be responsible for elaborating the poster lobe hormone vasopressin, oxytocin is produced the posterior lobe itself. Prof. G. Harris did n agree that the Gomori-stainable material seen in t axons which pass through the median eminence their way from the hypothalamus to the posteri lobe could be responsible for the activation of t anterior lobe, his reason being that there is evidence that electrical stimulation of the supr optico-hypophysial tract will liberate any anteri pituitary hormone. On the other hand, Dr. R. Porter, who earlier in the Conference had present a paper dealing with the part played by centr neural mechanisms in the so-called stress respons had reached the apparently contrary view that th median eminence, of which probably the major com ponent is the supraoptico-hypophysial tract, essential for the transmission of hypothalam influences to the anterior pituitary. Another questi that was raised was whether the same neurones whic are involved in neurosecretion also have resting an action membrane potentials, and whether they a capable of being excited by electrical stimuli, or conducting impulses. To this, as to many oth questions, there were no answers.

As one reads through the papers and the record discussions, one is inclined to feel that far too man points are raised, and far too few answered. O wonders, for example, why the possibility was n suggested that anterior pituitary hypofunction aft lesions in the median eminence, like that after stal section, is due to nothing more specific than th interruption of the gland's main blood supply, whic cannot fail to be interrupted either completely c partly when the median eminence is damaged. On wonders, too, why, in the discussion of H. A. Lard and G. F. Maley's paper on the metabolic effects c thyroid hormone *in vitro*, critical questions about th main hypothesis under discussion should be raise not once, but twice—and still left unanswered. Bu thoughts like these are perhaps as ungracious, as i is invidious, to direct them to a few out of so man excellent papers. The Laurentian Conference is a intimate affair, almost a club. It meets once a yea and clearly those who attend would not repeat thei visits if the free discussion and speculation th Conference allows did not provide a stimulus to thei further work. But some may wonder every now an then whether the progress of endocrinology woul not be better assured if some of the kites flown a the meeting were occasionally better fashioned, an their strings under more critical control.

S. ZUCKERMAN

## ence and Freedom

e Proceedings of a Conference convened by the
ngress for Cultural Freedom, and held in Hamburg
July 23rd–26th, 1953. Pp. 295. (London: Martin
ker and Warburg, Ltd., 1955. Published for the
ngress for Cultural Freedom.) 21s. net.

I this volume are collected, somewhat condensed
and translated, where necessary, the papers pre-
ted at the Congress on Science and Freedom held
Hamburg in July 1953, a brief account of which
s already been given in *Nature* (172, 445; 1953).
ere are some omissions as, for example, a con-
bution by Salvador de Madariaga, which is for-
nately preserved elsewhere, however, in his "Essays
h a Purpose". A preface by Prof. M. Polanyi
empts to give some unity to the proceedings.
mogeneity is most marked in the papers presented
the first two sessions, in which the Congress con-
ered the political and economic framework required
the cultivation of independent scientific research
a free society, and the book is to be welcomed for
oing on record in convenient and attractive form
e valuable contributions to a topic of current
erest from Prof. Polanyi himself, Dr. J. R.
ker, Dr. S. K. Allison, Dr. J. D. Millett, Prof.
an Thibaud and others and the discussions which
lowed.

The practical problems of organization and the
endant dangers are clearly displayed and in a way
at more than balances any shortcomings that are
nifest where the Conference touched on the
ilosophical implications and in which diversity of
inion and not unity is apparent. Even here, how-
er, the record has its value as a pointer to the
rd thinking which is still required from the man of
ence about the nature and limits of the scientific
thod, his duties and responsibilities as a citizen
d the interpretation and dissemination to the world
the results and implications of his work and
ought.

R. B.

## troleum Microbiology

n Introduction to Microbiological Petroleum Engin-
ring. By Prof. Ernest Beerstecher, Jr. Pp. xv + 375.
Iouston and New York: Elsevier Press, Inc.;
ndon: Cleaver-Hume Press, Ltd., 1954.) 55s. net.

THIS is a courageous but not altogether successful
attempt to link microbiology with petroleum
oduction engineering: it covers much border-
ne knowledge between bacteriology and petroleum
ology; but it is weakly linked with engineering,
ordinarily understood in the industry, since,
spite the author's obvious sincerity of purpose, it
difficult to see how the "marriage of petroleum
gineering and bacteriology" can be realistically
ccessful. When he says that "*microbiological
gineering* . . . is a little-known branch of engineer-
g . . . best visualized as that branch of chemical
gineering which employs naturally occurring
talysts as contrasted to inorganic and synthetic
talysts", he is still addressing himself primarily to
etroleum chemistry (with which is allied geology
n so far as geology is required at the outset) rather
han oil engineering.

The author lists the following as fundamentals in
his new 'discipline': role of micro-organisms in
eology and petroleum genesis; microbial utilization
f petroleum hydrocarbons; micro-organisms in oil
xplorations, drilling muds, oil-bearing rocks and
orrosion problems; effects of hydrocarbons on micro-organisms and their influence in manufacturing petroleum products; infectious micro-organisms derived from petroleum and products. Much of this is surely tangential to petroleum engineering. That bacterial forces operate in many and diverse spheres in petroleum science, realized in its more academic pursuits, in abundantly true. But does the petroleum engineer worry about this? If he has not up to now, will his future training perforce embrace this hybridism, and if so, to what practical end? Granted that vista, however, then this book appears at best as guide to a potentially unstable alliance.

H. B. Milner

## Fishes of the Western North Atlantic

Part 2: Sawfishes, Guitarfishes, Skates and Rays. By Henry B. Bigelow and William C. Schroeder. Chimaeroids. By Henry B. Bigelow and William C. Schroeder. (Sears Foundation for Marine Research—Memoir No. 1.) Pp. xv + 588. (New Haven, Conn.: Sears Foundation for Marine Research, Yale University, 1953.) 15 dollars.

IN connexion with the establishment of the Sears Foundation for Marine Research at Yale University in 1939, generous funds were provided for publication on an ambitious scale, and excellent use is now being made of the facilities thus made available. Memoir No. 1 of the Foundation is a monographic account of the "Fishes of the Western North Atlantic", and is being published as a series of magnificent volumes written by specialists in their respective fields. Part 1 of this Memoir was published in 1948 and was reviewed in *Nature* (164, 766; 1949). Part 2 has now appeared and deals with the sawfishes, guitarfishes, skates and rays. The geographical range of the species described remains essentially the same as in Part 1—that is, the western half of the North Atlantic, including the adjoining gulfs and seas from Hudson Bay south to the Amazon River. All that need be added to what has already been said in the previous review is that the present volume maintains in every way the very high standard set by the earlier part.

G. A. Steven

## Genetica Medica

1um Symposium Internationale Geneticae Medicae, 6–7 Septembris, MCMLIII. A cura di Luigi Gedda. Pp. xxiii + 468. (Roma: Edizioni dell' Istituto Gregorio Mendel, 1954.) 5,000 lire.

TWELVE addresses and eighteen papers of the symposium during September 6–7, 1953, occasioned by the opening of the Mendel Institute for Medical Genetics and Twin Studies in Rome, are presented here together with a discourse by His Holiness Pope Pius XII (in four languages) and an address by the then Prime Minister, Signor G. Pella. Well informed on the facts of genetics, but not so well on those of evolution, the Pontifical discourse constitutes the most valuable feature of this volume. It should be carefully read by all those interested in the social implications of biology.

Among the short papers, a few are of considerable interest. Most of the longer addresses are not. None of the leading human geneticists from Scandinavia, Britain and the United States appears among the contributors. The editorial standards are low. The high price of this volume is probably the consequence of the vast photographic documentation, including also a view of the Institute and two of the opening sessions of the symposium.

# BRITISH INSTRUMENT INDUSTRIES EXHIBITION, 1955

THE third British Instrument Industries Exhibition was held at Earls Court, London, between June 28 and July 9. The Exhibition provided a more impressive display of instruments for general use than has previously appeared in Great Britain. Such an exhibition, in fact, does even more than provide a display of instruments, for it gives a measure of the extent to which the use of scientific knowledge has penetrated into industrial and every other major human activity. The main purpose of the Physical Society's Annual Exhibition is to indicate the use made of scientific principles, both old and new, in the design of instruments. The main purpose of the British Instrument Industries Exhibition is to indicate the use which can be made of instruments so designed in the application of scientific principles to utilitarian purposes. Recently a conference was held at Margate, under the ægis of the Institution of Production Engineers, on the automatic factory (see also p. 183), and the recent Exhibition at Earls Court provides abundant evidence that the use of instruments and instrumentation in controlling a very wide range of industrial processes has long passed from the possible to the actual.

One of the first impressions given by any substantial instrument exhibition is the extreme diversity of the various classes of instruments. The 164 firms exhibiting at Earls Court covered almost every type of instrument used in applied science, and in any short account of the Exhibition only general observations can be made. It is apparent that, to a greater and greater extent in the field of industrial control by instrumentation, use is being made of the ability to convert any physical effect into a proportionate electrical quantity, and of amplifying the electrical quantity in a manner which preserves the original characteristics. It is an easy matter to convey an electrical effect from one point to another, and there, by the conversion of the electrical into, say, a pneumatic effect, to arrange that some variation in the original physical quantity measured shall operate, through this double conversion, some mechanical controlling device at some relatively remote position. The intermediate electrical stage comes within the field of electronics, and to the ubiquity of this newest of technologies there appears to be no limit.

One interesting development in the field of automatic control is the appearance of an apparatus for carrying out, completely automatically, the routine chemical analysis and the determinations of quantities, such as pH values, of samples of a particular liquid, which might be an integral part in a chemical engineering process, requiring continual control to achieve constancy of composition. The apparatus shown at the Exhibition was designed for a particular purpose; but, nevertheless, it would appear that a significant start has been made towards the possibility of carrying out 24-hour-a-day sample analyses without any of the drudgery to the human worker which may well accompany such activity.

Much has been said and written in recent times of the gap between discovery in science and application, but there was much at the Exhibition at Earls Cou to support the view that the tempo of application much greater than it once was. It was rather su prising to find that the energy of ultrasonic vibratio is being used very effectively for such operations drilling, grinding and polishing, and that vario varieties of ultrasonic machine tools are in existen In another direction it is apparent that the develo ment of the instrumental means for making use the properties of artificial radioactive isotopes b been exceedingly rapid and, in fact, it is hard to s that any sensible gap has existed.

One cannot but reflect, in going around an exhib tion of this type, that the scientific curiosities of t comparatively recent past provide the commonpla ingredients of scientific instruments to-day. Ultr sonics have already been mentioned; but also pho phorescence and fluorescence, paramagnetism certain gases, piezo-electricity, and many others, appear as active operating principles in moder instruments. It is apparent that the instrumen maker is far more adventurous than he us to be.

The interest in this exhibition of instruments wa however, by no means confined to the application new techniques or the further adaptation of o techniques. The engineering measuring instrumen on show not only provided an object lesson in them selves of precision engineering, but also indicate most surely that the usefulness of applied optics h by no means been exhausted. Some years ago muc criticism was levelled at the appearance and th convenience, as regards use, of British instrument The range of instruments referred to above and, fact, the whole exhibition of instruments, indicate how far the instrument industries have travelle since the time when such criticism had an validity.

It was possibly a pity that it was not more widel realized that such an exhibition of instruments the one so recently concluded has very considerabl educational value. On one hand, the changin character of industry, with a trend towards greate and greater automatic and instrumental control, obviously a matter of great importance, and to large extent the present state of affairs was epitomize in the Exhibition; no quicker way can be imagine of obtaining an impression of the extent of th application of science through instrument channel than that provided by a tour of it. On the othe hand, there can be no doubt that more and mor technicians in industry must be concerned with th use of instruments and, from the educational poin of view, it would have been well worth while fo industrial concerns to have arranged visits o a considerable scale by their technical personne to the Exhibition. It was apparent that muc greater advantage could have been taken of thi possibility, and it is to be hoped that the nex British Instrument Industries Exhibition, arrange by the five participating manufacturing association will attract a very much greater number of suc visitors.

# DUCATION AND TRAINING OF GRADUATE STAFF FOR INDUSTRIAL RESEARCH

THE education and training of graduate staff for industrial research was the subject of the fourth onference of Industrial Research Directors and anagers, which was organized by the Industrial esearch Committee of the Federation of British ndustries under the chairmanship of Mr. A. H. ilson, and held at Ashorne Hill, Leamington Spa, uring April 29–May 1. The Conference was attended y more than a hundred industrialists and some forty presentatives of science or technology from the niversities. Sir Graham Hayman, president of the ederation, acted as chairman, and Mr. George ithers, secretary of the Industrial Research Committee, acted as secretary of the Conference.

In the opening session, Sir Edward Bullard National Physical Laboratory, Teddington) spoke n staffing and managing a research department. e reminded the Conference that in a little more an thirty years research has grown from the pursuit f the individual scientist into an organized business. ut training in science still develops an individual pproach, and in consequence there can be psychogical difficulties when the young scientist becomes member of a large research department. This, and any other points in Sir Edward's address, were ken up in later sessions.

First-degree courses in science and technology, hich was the subject of the second session, may not ow offer much scope for original thought; but Prof. . G. Cox (Leeds) and Prof. J. A. Pope (Nottingham), e two introductory speakers, were not expected to o more than suggest lines of approach which the onference might consider in discussion groups. In e event, it proved that the discussion groups had terpreted the subject liberally. Clear thinking, a od grasp of fundamentals, and the ability to write raightforward reports are the usual virtues expected f good first-degree students, while the avoidance of ndue specialization and the continual pruning of verloaded curricula are characteristics of good first-egree courses. There was no disagreement.

But, inevitably, the well-known personal qualities hich industry, and indeed every employer of raduates, is looking for were reviewed, and there as an uneasy feeling that industry, in its anxiety find graduates who can readily accommodate emselves to team-work, is placing too much mphasis on a pleasant personality and is in danger f excluding graduates with original minds. After me misunderstanding about the employment of e graduate of modest abilities on development ork rather than on research, it was agreed that rst-class men are needed for both, but that more en of modest abilities can be employed on developent work, once it has been planned, than on search. An interesting point, which unfortunately as not considered in any detail, is the tendency of niversity courses to develop analytical, rather than onstructive, thinking, and it was suggested that he tendency is stronger in pure science than in ngineering.

On the whole, there was singularly little criticism f first-degree courses. The Conference was in symathy with the professor who said that it was not fficient to allow, as had been suggested, new knowledge to be concentrated by some natural process into simple principles, so lightening the courses. He favoured 'disarmament conferences' for reducing the content of the curricula, at least in engineering. The extension of first-degree courses from three to four years was briefly discussed, but received little support, mainly because the advantages it offers are outweighed by the fact that it will make the shortage of scientists and engineers even more acute.

The Conference found that it was quite impossible to discuss first-degree courses without quickly running up against the problem of the shortage of scientific and technical man-power; indeed, this became the background to all discussions. It is appropriate, as one research director put it, that the Conference should be thinking of ways of improving first-degree courses and the training given to graduates in the universities and in industry; but the most important question at the moment is how to find more boys of the present quality to read science and engineering. The Ministry of Education's report, "Early Leaving", suggests that the possibility of diverting boys from arts to science is not very great. The main hope lies in preventing early leaving. There may be as many as five thousand boys in Great Britain who leave the grammar schools at sixteen, but who would have been capable of studying at least two science subjects up to the Advanced level of the General Certificate of Education. One of the discussion groups directed attention to the great attraction that the Oxford and Cambridge classical scholarships have for the ablest boys, many of whom would have done equally well on the science side; but it was pointed out in the open discussion by a professor of chemistry that industry has it in its power to redress the balance between the number of arts and science scholarships at the universities, if this is thought to be unsatisfactory.

Mr. C. Paine (Imperial Chemical Industries, Ltd.) and Mr. C. W. Humphreys (General Electric Co., Ltd.) were the opening speakers in the third session, the subject being the selection and training of graduate research staff in industry. Mr. Humphreys deprecated what he termed the university scramble, in which firms, including his own, participate by sending representatives to the universities to recruit science and engineering graduates, and it was natural that this should be the starting point for the discussion groups. Everyone thought that the university scramble is unedifying and tending to get out of hand; but scarcely any really practical suggestions for removing the worst excesses were put forward. It was pointed out that a certain proportion of students go up to the universities having already decided on the career they intend to follow. If this proportion could be increased by making industry better known in the schools, selection would be easier. The university appointments boards through careers libraries help the student to make up his mind about careers, and their efforts are, or could be, reinforced by vacation courses, works visits and lectures by industrialists to faculty societies. There are apparently a few research directors who do not join the university scramble, and they experience no greater recruitment difficulties than those who do. The majority, however, look upon the scramble as a necessity, if only of self-defence. After remarking that it is the student that selects the firm, and not the firm the student, the chairman of the session, Sir Norman Kipping, accepted the suggestion of one of the discussion groups that the Federation of British Industries should examine the problem.

The training of graduate research staff in industry proved to be a somewhat intangible subject. Mr. Paine himself pointed out that, as compared with such matters as human relations in industry, it has not yet received much attention. It is further complicated by the fact that the training varies according to whether the graduate is a scientist or an engineer, and whether he is employed in a large or a small firm. The two-year apprenticeship for engineering graduates who are later to be engaged on research and development was held by some members of the Conference to be stultifying. As for the size of firms, this may be such that no training can be offered, in which case it is necessary to recruit men who have been in other firms. There appears to be nothing comparable for scientists, whose training is organized scarcely at all. Apparently, in certain firms the young graduate is given a range of problems and is permitted to select one for himself; in others, he is given a particular problem in applied research and told that a solution is wanted within a certain time.

The final session was a discussion on postgraduate training at the university, which was opened by Prof. H. W. Melville (Birmingham) and Prof. A. J. S. Pippard (Imperial College of Science and Technology, London), who dealt with the subject from the science and engineering points of view, respectively. The difference in their two points of view was so striking as almost to suggest that there were two quite separate subjects to be considered. Beginning with postgraduate training in science, the first question to be discussed was whether it is necessary for the young graduate to spend three years at the university on postgraduate training. Industry, it was said, can train him in a shorter period, and indeed the postgraduate course formerly lasted only two years. Apparently the length of postgraduate training depends on the particular science in which the graduate is doing research; that it has extended from two to three years is due to the complexity of modern research apparatus and the need for the student to master new techniques. It might be possible to shorten the postgraduate course if the universities could employ technical assistants on the scale on which they are employed in industry.

On the other hand, if it is true that the working life of the industrial scientist in the purely scientific field is about twenty years, even two years of postgraduate training represents 10 per cent of this period, and a longer course has therefore to be justified. It is also reasonable to ask whether the universities are themselves retaining too many young scientists. This question is not a simple one. Figures for the numbers of young science graduates remaining at the universities for further study and research are quite misleading, as these students leave the universities two or three years later and many of them enter industry. The number permanently retained by the universities is very small indeed, probably less than 2 per cent of the output. Further, although the proportion of newly qualified graduates remaining at the universities for postgraduate work may be as high as one in three, this does not mean that invariably all the ablest graduates decide to do postgraduate research. In fact, some of them prefer to go straight into industry.

The discussion on postgraduate training in engineering centred mainly on the need for a small number of young engineers in industry to return to the universities for advanced courses or research. Th need is recognized by industry; but the prese shortage of scientific and technical man-power mak it very difficult for firms to release staff for lo periods. Although industry is hopeful that th position may be easier in the not-too-distant futur at present it favours short courses. Immediate pos graduate training for engineers found little suppo at the meeting. It was even suggested that th practice of university engineering departments requiring postgraduate students to have had indu trial experience might be followed in other facultie at least as far as some of their staff are concerne Nevertheless, there was a plea for an additional yea either as part of the degree course or immediate postgraduate, for the potential research engineer wh needs an introduction to modern physics in ord that he should understand and be able to use th latest research tools.

The discussion closed with further references industry's shortage of scientific and technical ma power. First, it was felt that this is being made mo acute by the strong attractions of government esta lishments and of those firms engaged on governmen sponsored work. In consequence, the best you scientific brains are being concentrated in limite sections of the national effort to the detriment of th country as a whole. Second, and even more di turbing, it was said that the shortage of scientif man-power will last at least twenty-five years. A employers of scientists—industry and the universiti alike—will have to adjust their affairs accordingly.

---

# THE BUBBLE CHAMBER

By Dr. C. DODD

Physics Department, University College, London

UNTIL recently, two methods were available f the analysis of collision events produced b high-energy particles: the photographic emulsio reveals the tracks in the form of sensitized soli grains, and the cloud chamber produces tracks i the form of tiny liquid drops in a gas. The third a most recent method of detection, the bubble chambe exhibits the tracks in the form of strings of tin bubbles in a superheated liquid, and thereby com bines the high stopping power of the photograph emulsion with the easy scanning of the cloud chamb photographs. Moreover, the chamber possesse certain characteristics, such as rapid recycling an freedom from distortion and unwanted backgroun which are particularly desirable.

Dr. D. A. Glaser[1], of the University of Michiga discovered in 1952 that a liquid could remain strongl superheated in a clean chamber for several second in the absence of radiation, before the onset boiling; but that boiling was immediate in th presence of a radioactive source provided the degre of superheat exceeded a certain value. The radiatio ionizes the liquid, producing microscopic bubble carrying like charges, the effect of the charge repulsio being to tend to cause each bubble to increase in siz in opposition to the surface tension effect whic tends to make the bubble collapse. For a certai degree of superheat and for a certain degree ionization, all bubbles, no matter how small initially grow continuously to a finite size. The degree superheat is conveniently expressed as the differenc between the saturation vapour pressure at the tem

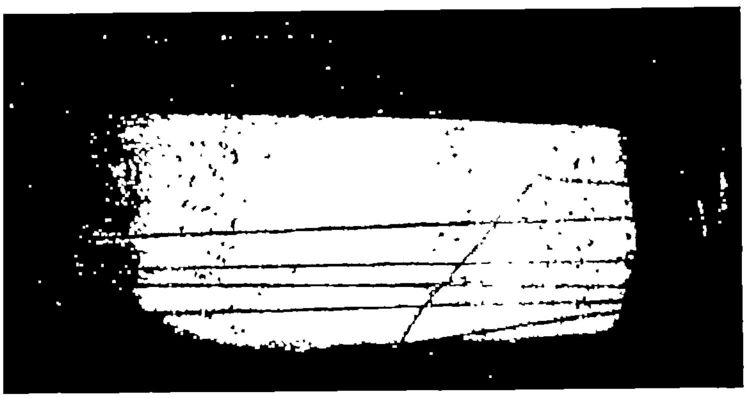

Fig. 1. π-Meson tracks in liquid hydrogen

rature of the liquid and the external pressure on e liquid after it has been expanded into the super-eated condition.

In use, the liquid in a smooth vessel is maintained equilibrium at a temperature much above its ormal boiling point by the application of sufficient ressure to the liquid, applied either directly via a iston-or through an elastic diaphragm subjected on e other side to gas pressure. On reducing this ressure to, say, atmospheric pressure, the liquid ecomes superheated and on the average would main quiescent for several seconds before violent oiling began. If, during this waiting period, an nizing particle passes through the liquid, it leaves ehind along its track a series of charged bubbles hich grow in a few microseconds to a size suitable r photography. Since the bubbles continue to grow ery rapidly, it is necessary to use a flash of only a w microseconds duration for the photographic lumination. This rapid growth-rate means that otion of the liquid medium around the tracks can ause only the minimum amount of distortion to the racks. Moreover, experiments seem to indicate that he charges induced on a bubble persist only for a w microseconds, so that events occurring before and uring the expansion do not produce unwanted ackground tracks. Another important consequence f the short life-time of the charge is that no clearing ield is necessary between expansions.

The chamber is reset by re-applying pressure to he liquid, so the complete cycle of events is: (1) xpand; (2) particle in; (3) flash; (4) recompress. ppropriate delays are inserted between stages. The ime-period of this cycle can be very short; so far, eriods as low as half a second have been used and frequency of 50 per second is contemplated and eems perfectly feasible.

Since the life-time of the charge is so short, the hamber must be in the sensitive condition when the onizing particle passes through it, so that counter-ontrolled expansions for use with cosmic rays are mpossible. It is hoped, however, to use the chamber or cosmic ray work by passing the liquid con-inuously through a cycle in which the time during which the liquid is in a sensitive condition represents n appreciable fraction of the total time of the cycle.

The density of the bubbles is a measure of the specific ionization of the particle producing them, and a hundred bubbles per centimetre can be achieved for minimum ionizing particles, so that precise determinations of ranges are possible. The density may be varied by altering the operating temperature, but the rather strong dependence of bubble density on temperature may present a serious obstacle to any attempt to relate this density to the specific ionization of the particle.

The initial experiments using small, cylindrical, all-glass chambers have shown qualitatively the immense possibilities of the bubble chamber. An example of the type of track obtainable is shown in Fig. 1, taken by Hildebrand and Nagle[4] at the University of Chicago. The chamber contained about 15 $cm.^3$ of liquid hydrogen at 26° K., at a pre-expansion pressure of 4 atmospheres, and was operated in a π-meson beam.

Such chambers have been designated 'clean' and are characterized by a relatively long waiting time in the absence of radiation. They suffer from the fact that the photographed track has suffered distortion by the curved optical media between the track and the camera; but if a plane window is inserted in the chamber wall in order to get over this difficulty, it is found that boiling always occurs immediately the chamber is expanded into the superheated condition. Fortunately, it is easy to confine this premature boiling to the gaskets used to fix the window to the body of the chamber; and it is then found that if the expansion is made sufficiently rapidly the pressure in the liquid away from the gaskets remains for a few milliseconds at a constant lower value, which is low enough to allow the growth of charged bubbles, provided the temperature of the liquid is somewhat higher than that required for operation of the corresponding clean chamber. The ionizing particles are pulsed to traverse the liquid during this sensitive time, that is, a few milliseconds after the beginning of the expansion. Such chambers are designated 'dirty', and probably because of the higher temperature and pressure at which they operate, the bubbles formed in them grow much more slowly than in a clean chamber, but still fast enough to make track distortion negligible.

Both types of chamber may be biased against recording tracks of weakly ionizing particles simply by reducing the operating temperature slightly, so that only strongly ionized bubbles are capable of continuous growth.

Many liquids have been successfully employed in bubble chambers, including methyl alcohol, diethyl ether, carbon tetrachloride, sulphur dioxide, benzene, pentane, propane, nitrogen and hydrogen. The choice has been governed by the magnitude of the pressure required to keep the liquid from boiling when at the operating temperature, though it is important to avoid the use of liquids of 'modern' origin which may contain radiocarbon atoms. Provided the liquid contains only atoms of low atomic number, the Coulomb scattering is minimized and momentum measurements from the curved tracks obtained in the presence of magnetic fields should be possible. Pentane satisfies these requirements, and Glaser and Rahm[5] have successfully operated a 'dirty' pentane chamber of more than half a litre capacity in the 2-BeV. proton beam from the Brookhaven cosmotron. In Fig. 2, the horizontal tracks mark the proton beam, and other events producing tracks of various bubble densities are visible. The operating temperature was 155° C. and the flash occurred

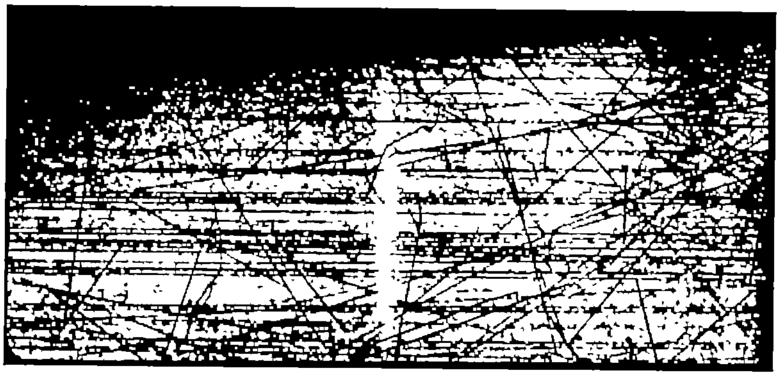

Fig. 2. Tracks produced in pentane by a 2-BeV. proton beam. From Glaser, D. A., and Rahm, D. C., *Phys. Rev.*, 97, 474 (1955)

90 microseconds after the transmission of the proton pulse. Bubbles produced by premature boiling around the top of the observation window have not interfered with the quality of the tracks in the middle of the chamber.

Prof. Luis Alvarez and his group at the University of California have concentrated on the development of the liquid-hydrogen bubble chambers, since this liquid presents a pure proton target. Already, using a 4-in. diameter chamber with a cycling time of only 4 sec., *V* events and $\pi$-$\mu$-electron decays have been photographed, and chambers containing several gallons of liquid hydrogen and operating in a magnetic field are projected for use with the Berkeley bevatron.

# OBITUARIES

## Mr. J. S. Wilson

A FAMOUS controversy on the design of masonry dams is recalled by the death on May 20, at the age of seventy-nine, of Mr. John Sigismund Wilson. Doubts cast by Prof. Karl Pearson and one of his research students, L. W. Atcherley, on the validity of existing methods of designing such dams led to a decision by the Egyptian Government to postpone the proposed heightening of the Aswan Dam, after Sir Benjamin Baker, their consultant, had demonstrated the behaviour of models, made of stiff jelly. This decision caused widespread discussion and criticism, especially of the use of jelly to simulate masonry, and Wilson, who was then on Baker's staff, made further experiments, in conjunction with William Gore, using models of rubber, loaded to give the effect, to scale, of the density of masonry. By this means he was able to show that the method to which Pearson and Atcherley had taken exception was, in fact, in order; and, as is well known, the Aswan Dam was duly heightened.

The ingenuity displayed in the design of his model, the result of no mere guesswork but of logically pursued reasoning, was typical of Wilson's approach to the kind of problem in which, as a consulting engineer, he specialized—the sort which lies in the common ground between civil engineering and architecture. Born in Cairo on October 13, 1875, he was educated at St. Paul's School, London, and entered the City and Guilds (Engineering) College (then the Central Technical Colleg in 1893 to take the course in civ and mechanical engineering. E qualified in 1896 and, after a sho period in the office of a civ engineer, Burness Greig, entere that of Sir John Fowler and S Benjamin Baker, the designers the Forth Bridge and the Aswa Dam. Fowler died two years late but Wilson remained with the firn which had become Baker an Hurtzig, until shortly before tl First World War, in the course which he was associated with th design of directors for anti-aircra guns. After the War he went int partnership with H. C. Booth (th inventor of the vacuum cleaner) and C. W. Pettit, be ing concerned mainly with the design of bridges. Sinc 1932 he had been in practice on his own accoun latterly in association with Mr. John Mason.

Wilson took an active part in the endeavours t prevent the demolition of the old Waterloo Bridg across the Thames and was honorary secretary o the conference which, in 1926, sought to preserve it for which, and other work in the preservation o ancient buildings, the Royal Institute of Britis Architects elected him an honorary associate. H was a member of the Institution of Civil Engineers of the Royal Institution and of the Newcome Society, and was serving on the Council of the last named Society at the time of his death. He was als an active supporter of the British Association, bein secretary of Section G (Engineering) in 1923, recorde during 1929–34 and president of the Section at th Norwich meeting in 1935. He was president of th Old Centralians, the association of former student of the Central Technical College, in 1933, and ha received the distinction of Fellow of the College i 1929.

J. Foster Petree

## The Hon. Camilla Wedgwood

THE HON. CAMILLA HILDEGARDE WEDGWOOD, third daughter of the first Baron Wedgwood, died on May 17 in Australia. She was born on March 25, 1901. She received her university education at Bedford College, London, and at Newnham, specializing finally in anthropology, which she studied particularly under Dr. A. C. Haddon, to whom she always remained greatly attached. During 1926–27 she became an assistant lecturer in the Department of Social Studies at Bedford College. Then she went out to Australia, in and around which most of her future work lay. For Australia she formed a very great liking and performed much public service there. During 1928–29, as lecturer in anthropology in the Department of Anthropology at the University of Sydney, and since 1936 as honorary lecturer, she taught students with sound scholarship and flashes of brilliant exposition. For some years after 1935 her great capacity and interest in students served her as principal of the Women's College at the University of Sydney—a post to which she brought freshness and originality, having great influence on the students under her charge.

Miss Wedgwood had always wished to undertake anthropological field research. During 1932–34 she held a fellowship from the Australian National Research Council, and worked on Manam, an island the northern New Guinea coast. In this relatively lated community she made a social study with cial reference to the life of women and children and the effects upon the local culture of contact with culture of white people. She found this research ractive and published interesting material from it. e undertook a further shorter period of research in uru in 1935, at the invitation of the Administrator, ain primarily to study culture change. When war me she volunteered her services and became a utenant-colonel in the Army Women's Services, tached to the Army Directorate of Research. ter she undertook work in Army education, and after the close of the War specialized particularly in the training of education officers for the New Guinea Service, in a post which she held at the Australian School of Pacific Administration. Shortly before she died, her services to the cause of native education in New Guinea were recognized by the Government of the Commonwealth in naming a New Guinea girls' school after her.

Camilla Wedgwood was a cultured woman of striking appearance and many interests, vividly concerned with human problems. She had many friends, who will mourn her early death.

RAYMOND FIRTH

# NEWS and VIEWS

## of. S. J. Davies

PROF. S. J. DAVIES has retired from the chair of echanical engineering in King's College, London, d has been succeeded by Prof. L. J. Kastner, the University College of Swansea (see *Nature*, 1, 1004; 1948). Prof. Davies was appointed the chair at King's College in 1937. He was e of the distinguished band of engineers who me originally from H.M. Dockyard, Portsouth, where he gained a Whitworth Exhibition. uring the First World War he was engaged on the spection of aircraft engines and later was deputy orks manager of the Clyde Engineering Co., Ltd. uring 1920–26, he was lecturer in mechanical gineering in Armstrong (now King's) College, ewcastle upon Tyne. He then went to King's llege, London, as reader, and in 1937 was appointed professor in succession to Prof. Gilbert Cook; d now, after eighteen years as professor, he has ken up his new appointment as dean of the Royal ilitary College of Science at Shrivenham (*Nature*, 4, 727; 1954). Prof. Davies is widely known for s researches on oil engines. He has twice been warded the Herbert Akroyd Stuart Prize of the stitution of Mechanical Engineers, and has also ceived prizes from the Institution of Automobile ngineers and the Institute of Marine Engineers. In 51 he was elected a Fellow of King's College, ondon.

## rasitology at Imperial College, London: Prof. B. G. Peters

DR. B. G. PETERS, head of the Nematology Department of Rothamsted Experimental Station, has been pointed the first professor of parasitology at the nperial College of Science and Technology, London. rom Bristol Grammar School he went to the niversity, where he graduated with first-class nours in zoology in 1925, and received his M.Sc. in 27. During 1925–28 he was on the staff of the stitute of Agricultural Parasitology, St. Albans, st as a scholar of the Ministry of Agriculture and ter as Grocers' Company research scholar. He tained his Ph.D. of the University of London in 28. When the Imperial Bureau of Agricultural arasitology was started in 1929, he was its first puty director and remained so until 1932. From en until 1936 he was demonstrator, later lecturer, helminthology at the London School of Hygiene d Tropical Medicine, and became a recognized acher of the University in 1935. He returned to e Institute of Agricultural Parasitology in 1936 and, except for two years in Bomber Command Operational Research (1943–45), remained in that Department until, in 1947, it became the Nematology Department of Rothamsted. He succeeded Dr. T. Goodey as head of this Department in 1952. His early research dealt with the taxonomy and bionomics of the vinegar eelworm. Later he turned to the use of statistical methods in helminthological research, and his contributions in this subject have been fundamental in placing experimental helminthology on a sound basis. Since 1948 he has been studying the potato-root eelworm, *Heterodera rostochiensis*, and developing methods for laboratory assays and field-trials of nematicides.

## Haskins Laboratories, Inc.: Dr. F. S. Cooper

DR. FRANKLIN S. COOPER has been elected president and director of research of Haskins Laboratories, Inc., of New York, to succeed Dr. Caryl P. Haskins, who has been appointed president of the Carnegie Institution of Washington as from January 1, 1956 (*Nature*, 174, 1172; 1954). Dr. Cooper was born in Robinson, Illinois, in 1908 and graduated from the University of Illinois. He received his Ph.D. degree in 1936 from the Massachusetts Institute of Technology. He was with the Research Laboratory of the General Electric Company until he joined Haskins Laboratories in 1939, where he has been associate director of research. He was senior liaison officer of the Office of Scientific Research and Development during the Second World War, in charge of the exchange of scientific information with the Allies. He has served as consultant to the Secretary of Defense and to the Atomic Energy Commission of the United Nations. He is a member of various scientific and professional societies and of advisory committees of the Massachusetts Institute of Technology and New York University, and is adjunct professor of acoustic phonetics at Columbia University. Haskins Laboratories is a non-profit scientific and educational foundation. Its effort has been in scientific research and research training in selected borderline fields.

## Conference on the Effects of Nuclear Weapons

A CONFERENCE of scientists is to be held during August 3–5, under the auspices of the World Association of Parliamentarians for World Government, to discuss the nature and extent of the danger to mankind involved in experiments with nuclear weapons and their possible use in warfare. The meeting will take place in the County Hall, London.

The British Committee for the Conference is: Lord Boyd Orr (*chairman*), the Right Hon. Walter Elliot, Earl Russell, Gilbert McAllister, G. V. Morris, Prof. J. Rotblat and Henry Usborne. The conference fee for delegates (members of Parliament and scientists with a recognized qualification) is £3 and for observers £2. Particulars can be obtained from the Secretary-General of the World Association of Parliamentarians for World Government, 21 Hampstead Lane, Highgate Village, London, N.6.

## Colonial Development Corporation: Report for 1954

In the annual report and statement of accounts of the Colonial Development Corporation for the year ended December 31, 1954 (pp. 50. London: H.M.S.O., 1955; 2*s.* net), staccato presentation and condensation have been carried to a point which make it difficult to gain a clear picture of the work of the Corporation and its relation to Colonial development generally. Financial results indicate that the Corporation's net loss on the year has been reduced to £222,353; but, in spite of the abandonment of unsound projects, the Corporation at the end of 1953 still had a cumulative deficit of £9·7 million, of which £6 million represented losses on projects and activities begun before December 31, 1950, and afterwards abandoned; until satisfactory relief is given the legacy of the past will remain a factor in policy. Seven new projects were commenced during the year, and one—the experimental Yundum farm, on land originally cleared for the Gambia poultry farm—was abandoned, leaving the Corporation with fifty-six continuing projects and investigations. At the end of the year the Corporation was managing directly, or through controlled companies, sixteen trading projects with an aggregate turnover of more than £6 million a year, selling such diverse commodities as beef and hides, rice, bananas, rubber, hemp, timber, cement, electric current, housing finance and hotel accommodation. Heavy expenditure is still carried on many projects which are sterile until communications are provided, and other projects have to bear heavy public utility expenditures which by other capitalization can outweigh the marginal risk in which the Corporation deals. The report emphasizes that, although the staff is still a nucleus and requires strengthening, it is competent and reliable within that limitation, and acknowledgment is also made of the services of the scientific panel. Little indication is given of any scientific work under the Corporation; but the report notes that trials with ramie, citrus and cocoa in British Honduras have yet to disclose the best way to stimulate the economy of the territory.

## Diploma Awards in Technology

It was announced in the House of Commons on July 14 by the Minister of Education, Sir David Eccles, that a National Council of Diplomas in Technology in Technical Colleges is to be established, and that Lord Hives, chairman and managing director of Rolls-Royce, Ltd., has been appointed chairman of the Council. Awards will be available to students in technical colleges in Britain who successfully complete technological courses approved by the Council. It is intended that the diploma award shall be comparable in standard with a first degree of a university. The question of a post-graduate award is to be considered later.

## Higher Technological Education in South-ea England

The sixth annual report of the London and Hor
Counties Regional Advisory Council for High
Technological Education, covering the year end
August 31, 1954 (pp. 40; from the Council, Londo
1955), apart from a brief account of the sixth annu
meeting on July 15, 1954, is concerned chiefly wi
activities related to particular industries. In gener
policy the Council decided to support the Nation
Advisory Council's scheme for creating and admin
tering awards in technology, but made the provi
that reconsideration of the title of the award a
further consideration of a title for a higher awa
should be made, and that the relationship of the tv
boards of studies (one for engineering and the oth
for technologies other than engineering) and of t
details of their respective constitutions should
clarified. The Council has also commented on t
'sandwich' principle in general but, while general
approving the principle of combined college a
works training in about equal periods over three
four years, regards it as likely to be only of limit
application in the London and Home Counties regi
except in electrical, mechanical and productic
engineering. All but one of ten such courses
operation during 1954–55 are in engineering. Of t
Council's activities to assist technical training f
particular industries, it can only be said here th
the very variety of trades to which the wo
'technology' is, at least by implication, applie
makes it understandable that there should be su
slow progress in the expansion of technologic
education. There is little or no indication in th
report of any clear distinction between a techniqu
and a technology, and, while that confusion persist
progress is bound to be impeded.

## The Botanical Society of the British Isles

Membership of the Botanical Society of the Britis
Isles has reached a total of a thousand. This mea
that membership has doubled since January 1, 195
when it stood at 498, and during this period t
scientific standard of the Society's periodica
(*Watsonia* and the *Proceedings*) and of the meetin
(especially the conferences and the annual exhibitio
meetings) has been raised to a high level. T
Society is descended from "The Botanical Society
London", founded in 1836. It is evident from th
long history that there has never before been a tim
when interest in British field botany would hav
supported a membership approaching the prese
size at the scientific level at which the Society aim
Moreover, some recent developments, such as th
Distribution Maps Scheme and junior meetings f
students, are being supported by many people wh
are not at present members of the Society.

## Kilogram Standard Weight for South Africa

An international standard 1-kilogram weight ha
recently been made for the South African Governmen
by the firm of L. Oertling, Ltd. (St. Mary Cray
Orpington, Kent), the same company that made las
year a primary standard 10-tola weight for th
Government of Pakistan (*Nature*, **174**, 296 and 1094
1954). The weight is made from an alloy containin
90 per cent platinum and 10 per cent iridium, sup
plied by Johnson Matthey and Co., Ltd. (Hatto
Garden, London), and is in the form of a cylinder o
equal diameter and depth with a slightly concav

se so that the weight rests on an annular ring. e tolerance specified was ± 0·15 mgm. on the ished mass, and the weight has been certified by e International Bureau of Weights and Measures Sèvres, near Paris, as being well within the permitted tolerance, thus making it one of the World's ternational Kilograms. A weighing accuracy of o parts in $10^8$ was necessary. The manufacture of e weight involved a protracted series of accurate eighings coupled with the removal of successively aller and smaller amounts of material from the eight, so that the correct nominal mass and the timum surface finish were achieved simultaneously.

### andard X-Ray Diffraction Powder Patterns

The fourth in the series of "Standard X-ray iffraction Powder Patterns", prepared by the ational Bureau of Standards, Washington, D.C., s recently been published (N.B.S. Circular No. 539; . 75. Washington, D.C.: Government Printing ffice, 1955; 45 cents); in it are presented data for e elements, thirty-five organic compounds and two termetallic compounds. The patterns are recommended to replace ninety-five cards in the card file the American Society for Testing Materials and, addition, seven compounds (gallium oxide, neomium oxide, strontium chloride, thallium iodide, lver oxynitrate, aluminium antimony and indium ntimony) which are not represented in the file are cluded. The card file serves as a system for the entification of unknown crystalline materials based the three strongest reflexions of each material. In e new publication a comparison is made between l powder diffraction data available for each of the bstances reported. The samples used by the Bureau make the patterns were special preparations of ceptionally high purity obtained or prepared only in nall quantities, and the purity of each sample was etermined by spectroscopic or chemical analysis. A eiger-counter X-ray diffractometer was used, and e *d*-spacings were assigned Miller indices by comarison with calculated patterns. The densities and ttice constants also were calculated, and the fractive indices were measured wherever possible. etailed references are given.

### ystematic Anatomy of the Monocotyledons

The project of preparing a comprehensive book on e systematic anatomy of the Monocotyledons, arallel to that already available for the Dicotyledons, nd recent investigations towards that end, have been scussed by C. R. Metcalfe (*Kew Bull. Misc. Inf.*, o. 4, 523; 1954). Such a work of reference is badly eeded and is now one of the main undertakings in e Jodrell Laboratory of the Royal Botanic Gardens, ew. The numerous scattered contributions on onocotyledon anatomy have already been indexed preparation for the new work. It is realized that e proposed survey must necessarily be of a somehat general character, based on the existing terature, supplemented by the new investigations f different families now being undertaken at Kew nd elsewhere. The main objects of the book will be serve as a dictionary in which the reader can uickly ascertain what is known about any paricular plant, and, by reference to the literature, ollow up any particular aspect of plant structure; serve as an aid in identifying economic materials f monocotyledon origin; and to advance taxonomic tudies of the Monocotyledons and to throw light on heir phylogeny. An account is given of recent progress in the relevant anatomical investigations at Kew, reference being made to the Gramineae, Alismataceae, Xanthorrhoeaceae, Zingiberaceae, and to such topics as the nature of the tracheal elements in different groups. It has been recognized that anatomical studies of this kind have revealed characters which are important in the broad taxonomy of the group; but the author rejects the view that our knowledge is already so complete that it is scarcely worth while pursuing the subject further. On the contrary, he considers it probable that fuller comparative anatomical studies will ultimately contribute to an improved classification, and will help to make possible a much more comprehensive understanding of the physiology and form of the flowering plants than we yet possess.

### Soils of the Glastonbury District of Somerset

The soils of the Glastonbury district of Somerset are the subject of a recent Memoir of the Soil Survey of Great Britain, by B. W. Avery (pp. 131+4 plates. London: H.M.S.O., 1955; 15*s.* net). The area mapped comprises Sheet 296 of the Ordnance Survey and is of interest because it includes some of the 'teart' pastures of Somerset, where cattle are liable to suffer from a distinctive form of scouring, an ailment now known to be due to excessive amounts of molybdenum in the herbage. These pastures are confined to calcareous soils developed from the Lower Lias clays. The area of 216 square miles described in the memoir lies in the centre of Somerset and is predominantly rural in character. Calcareous soils form the largest group (36 per cent), while the brown earth and gley groups together account for a further 49 per cent of the soils of the area. The remaining soils are chiefly organic (13 per cent) developed over peat and are practically confined to the Sedgemoors. The concluding chapter on the agriculture and land use of the area is concise and well written and will be of more general interest. Descriptions of typical profiles and analytical data are provided in an appendix. There is also a glossary of technical terms which makes the report more palatable to the non-specialist.

### Rugby School Natural History Society

The report of the Rugby School Natural History Society for 1954—its eighty-eighth issue—again shows the valuable work done by school natural history societies in building up and sustaining interest in living things. Some years ago the Society decided to produce a complete natural history of the Rugby District, and 1954 saw the completion of the first instalment—the "Flora". The value of the work has been recognized by the Royal Society with a grant of £50 towards the cost of publications. Among other activities were a series of experiments to determine the feeding habits of certain freshwater animals in a local pond; an investigation into the importance of the cow-parsnip (*Heracleum sphondylium*) in the economy of various insect species; and an account of the archæological section's digging at the site of Brownsover in order to elucidate the date and purpose of the earthworks that are scattered around the village.

### Polish Academy of Sciences: *Quarterly Review of Publications*

The first issue of the *Quarterly Review of Publications*, published by the Polish Academy of Sciences, Warsaw, covers the period April–June 1954 and includes abstracts from a total of 112 monographs and periodicals published by the Academy and other associated bodies in Poland. Titles are given in the original version, followed by an English translation. Bibliographical data are grouped under the various subjects, which number thirty-six in all and include, besides the conventional scientific and technical ones, such subjects as economics, history, law, linguistics, literature, oriental studies and philosophy. Under agriculture, four journals are listed, two of them being new—*Postępy Nauki Rolniczej* and *Roczniki Gleboznawcze*—while under archæology various publications are given of the Warsaw Society of Science and Letters, the Polish Archæological Society and the Institute of the History of Material Culture. Papers which have appeared in *Urania* and in *Postępy Astronomii* are included in the astronomy section, and under biology close on one hundred papers published in the *Bulletin de l'Académie Polonaise des Sciences*, *Ekologia Polska*, *Folia Biologica*, *Kosmos*, *Wszechswiat* (The Universe) and *Przegląd Antropologiczny*. The chemistry section contains mostly papers published in *Roczniki Chemii* and *Wiadomosci Chemiczne*. Two new books on Poland of the Renaissance period and numerous papers published in *Kwartalnik Historyczny* and *Przegląd Historyczny* are listed under history, and under linguistics is mentioned a new "Dictionary of Old Polish", which is an account of words and their forms as preserved in manuscripts from the earliest times up to 1500. In the literature section there are several new essays on Prus, Zeromski and some contemporary writers. Under mathematics is a new journal, *Annales Polonici Mathematici*; under medicine a number of new monographs and a new journal, *Postępy Wiedzy Medycznej*; and under oriental studies another new journal, *Przegląd Orientalistyczny*. In the section headed philosophy is listed a new joint publication by several authors on the "Problem of Humanism", and in that on physics are a large number of original papers which appeared in the *Acta Physica Polonica*, *Bulletin de l'Académie Polonaise des Sciences*, *Classe troisième*, and *Postępy Fizyki*. The physiology and biochemistry section lists the contents of the relevant issues of two journals (see *Nature*, April 16, p. 667), and in the zoology section there are several new monographs including one on Caryophyllaeidae in Poland.

## *Progresso Terapeutico*: a New Italian Medical Review

A new Italian quarterly medical review, *Progresso Terapeutico*, has recently been started, edited by Ottavio Carlotto under the direction of a scientific committee. The first issue (January–March 1955; from Via Ascoli Piceno 19, Rome; price not stated) consists of forty-eight pages, the first twenty-four of which are devoted to articles by G. Luciani, on recently discovered vitamins; by V. Romeo, on an unusual hæmatological reaction (reduction of the number of granulocytes) occurring in the course of tonsillitis; by C. Pagliuca, on erythromycin derived from *Streptomyces eritrens*; and a report on the conference held by Prof. R. Lattes in the medical clinic of the University of Milan on smoking and cancer of the lung. The rest of the review gives accounts of the second congress of the Italian Society of Chemotherapy and of the eleventh national reunion of the Italian Metapsychic Society; scientific notes; short abstracts from Italian and other medical journals; a note on chronic bronchitis, bronchiectasis and *cor pulmonale*; short reviews of books and papers; various notices; and a page, by L. Vitale, c epigrams against medical men.

## Transvaal Museum, Pretoria: *Bulletin*

For many years the results of the researches c the staff of the Transvaal Museum, Pretoria, hav been published in their own *Annals and Memoir* Now a *Bulletin* (No. 1, March 1955; pp. 8) has bee issued to cover the more popular activities of th Museum. The first number contains a useful note o trapping butterflies, descriptions of expeditions t Mocamedes and Northern Bechuanaland and detail of recent acquisitions in the Museum.

## Electrical Standards and Metering: Exhibition i the Science Museum, London

A special exhibition on electrical standards an metering has been opened at the Science Museum London, to coincide with the current meeting of th International Electrotechnical Commission and wi remain open, admission free, until October 31. Th exhibition is intended to show the general public th care which is devoted to the accurate calibration c electricity meters, though there are, in addition, mor specialized exhibits which will appeal to thos directly concerned with the problems of meterin bulk supplies of electrical energy to large industria and commercial undertakings. In the section dealin with the origin and derivation of the various electrical units, an exhibit of particular interest is th complete set of the original units of resistance whic were made in 1864 for the British Association an constitute the oldest set of accurate electrica standards now in existence. These 'B.A. units' hav been stored for many years at the National Physica Laboratory, Teddington, and the Science Museum hopes to acquire them and incorporate them in it national collection of historic scientific apparatus.

## Mineral Resources Policy in Great Britain: Symposium in London

The Institution of Mining and Metallurgy i arranging a symposium on mineral resources polic in Great Britain, to be held in the hall of the Roya Society of Arts, John Adam Street, Adelphi, Strand London, W.C.2, on September 22. The object of th symposium is to allow fuller discussion of the proposals contained in a paper on "Mineral Resource Strategy", originally read by Mr. D. A. Oliver (directo of the Group Research Centre of the Birmingham Small Arms Co., Ltd.) at a conference on researc and industrial productivity held in London i November last year. The theme of Mr. Oliver' paper is that minerals productivity will be increase if greater co-ordination of the right kind can b established between all the interested parties— geologists, mineral dressing and mining specialists mining and finance houses, mining engineers, loca authorities, fabricators and users, and finally th Government. An Office of Materials Mobilizatio has been established in the United States wit similar objects, and proposals for setting up a comparable organization have been put forward in Grea Britain from time to time. Five other papers hav been submitted to the symposium, dealing respectively with mineral development and research in th United States and Canada; the mineral industry i East Africa; Canadian aids to its mineral industry some economic considerations in a British minera resources policy; and a proposal for a central ore dressing laboratory. These papers and that of Mr ver will be circulated in advance and will form basis on which the discussions can proceed. The eting will be open to non-members of the Institu- n. Further information can be obtained from the retary of the Institution, Salisbury House, sbury Circus, London, E.C.2.

## amin E: Congress in Venice

THE third International Vitamin E Congress will held in Venice during September 5–8, in the mises of the Cini Foundation on the Island of San rgio Maggiore. Each day will be devoted to a rticular topic, namely, the relation of vitamin E the following: metabolic processes; other amins, hormones and enzyme systems; cardio- scular system; and nervous and muscular system. the mornings, reports will be given on experi- ntal studies, and in the afternoons, papers on nical investigations will be read and discussed. e official languages of the congress will be English, ench, German, Italian and Spanish. Further ormation can be obtained from the secretary, of. Emilio Raverdino, Via Pietro Verri 4, Milano.

## rrelation between Calculated and Observed Stresses and Displacements in Structures

A CONFERENCE on the "Correlation between Cal- lated and Observed Stresses and Displacements in ructures" will be held by the Institution of Civil gineers in its premises at Great George Street, estminster, during September 21–22. Twenty pers will be presented and discussed in the fol- wing four separate sessions: philosophy and tech- ques of testing; steel structures; concrete struc- res; and earth pressures and movements. The pers to be presented will be printed in a preliminary lume available in August, and a final volume ntaining the discussions at the conference will be inted towards the end of this year. The regis- ation fee of £2 will include a copy of the preliminary d final volumes of the proceedings, and extra pies will be obtainable at 30s. a set. Application ms, to be returned by August 1, and further ormation can be obtained from the Secretary of e Institution, Great George Street, Westminster, ndon, S.W.1.

## ormation Theory: Symposium in London

THE third London Symposium on Information eory will be held in the Royal Institution, 21 bemarle Street, London, W.C.1, during September –16. Each day will be devoted to a particular pic as follows: fundamentals; coding, taxonomy, c.; language analysis and mechanical translation; eaning and the human senses; and behaviour and mechanism. Copies of the papers will be circu- ted in advance. The registration fee for the con- rence is £2 10s. Further information can be tained from Dr. Colin Cherry, Department of ectrical Engineering, City and Guilds College, hibition Road, South Kensington, London, S.W.7.

## ciety for Applied Bacteriology: Officers

FOLLOWING the annual meeting and summer con- rence of the Society for Applied Bacteriology, held Cambridge during July 3–6, the following were pointed officers of the Society: *President*, S. B. homas; *Secretary*, G. Sykes (Microbiology Division, oots Pure Drug Co., Ltd., Nottingham); *Treasurer*, S. Miles; *Editors of the Journal of Applied Bac- iology*, Dr. S. E. Jacobs and Dr. L. F. L. Clegg; *Publications Manager*, E. A. Whitlock; *Advertising Manager*, E. J. Mann. Dr. Ella M. Barnes, H. B. Hawley and W. H. Pierce were elected to the Committee in succession to Dr. L. A. Allen, Dr. M. Ingram and D. A. McKenzie, who retired by rotation.

## Announcements

PROF. C. VAN RIET LOWE has retired from the directorship of the Archæological Survey of the Union of South Africa, Johannesburg, and has been succeeded by Mr. B. D. Malan, of the University of the Witwatersrand. Prof. van Riet Lowe will continue to hold the chair of archæology in the University of the Witwatersrand.

IN connexion with the opening of a new Schmidt telescope at the Hamburg Observatory, a symposium will be held there during August 19–20 on the problems, methods and astronomical programmes relating to such telescopes. Further information can be obtained from the Hamburger Sternwarte, Hamburg-Bergedorf.

THE annual general meeting in the United States of the Association for Computing Machinery will be held at the Moore School of Electrical Engineering, University of Pennsylvania, during September 14–16. Further information can be obtained from Sidney Kaplan, Radio Corporation of America, Computing Systems Engineering, Building 13-2, Camden 2, N.J.

THE Society of Dyers and Colourists is holding a symposium on "Bleaching, Dyeing and Finishing To-day" during September 13–17 in the Northern Counties Hotel, Portrush, Northern Ireland. This will be the first time that the Society will have held a symposium in Northern Ireland. Further information can be obtained from the General Secretary of the Society at Dean House, 19 Piccadilly, Bradford 1, Yorks.

THE Institute of Rural Life at Home and Overseas is holding a residential course of rural studies at the Essex Institute of Agriculture, Writtle, near Chelmsford, Essex, during August 28–September 10. The course will cover a wide field of overseas problems, as well as local ones, and will be particularly useful for missionaries, social workers, Colonial students and other visitors from overseas. The fee for the course is 19 guineas. Further information can be obtained from the Secretary of the Institute at 59 Bryanston Street, London, W.1.

THE fifth congress on biological rhythm arranged by the Societas pro Studio-Rhytmi Biologici will be held in the Department of Anatomy of the Caroline Institute, Stockholm, during September 15–17. The three main themes to be discussed will be rhythmical phenomena in the nervous system, cybernetics, and rhythm and industrial medicine. Further information can be obtained from the Secretary of the Fifth Rhythm Congress, Societas pro Studio-Rhytmi Biologici, Anatomiska Institutionen, Karolinska Institutet, Solnavägen 1, Stockholm 60.

THE University of Padua is offering a Gabriella Zuccari scholarship of 300,000 lire for research of at least six months duration at the Zoological Station, Naples, during the academic year 1955–56. The scholarship is open to any person who wishes to undertake research in zoology, comparative anatomy, physiology or embryology, and it may be renewed up to a maximum of three years. Application forms, to be returned by October 31, and further information can be obtained from the Secretariat of the University of Padua.

# THE ENGINEER AND THE CONSERVATION OF NATURAL RESOURCE

IT has now become a truism that the history of man's achievement has been his constant effort to master the forces of Nature and the tremendous resources that are his inheritance. But in his endeavour to fulfil this aspiration, which has never been entirely realized, man has disturbed the delicate balance maintained by Nature in guarding her resources and has created the problem of conservation of these natural resources, the depletion of which is, in some quarters, a matter of growing concern. Such was the subject of the first Graham Clark Lecture, delivered to the Institution of Civil Engineers on May 4 by Sir Harold Hartley. The Lecture is given in honour of the late Graham Clark, who for many years was secretary of the Institution and who strove to promote co-operation between engineering societies both in Britain and abroad; after paying a brief tribute to him, Sir Harold turned to the main topic of his address, a subject which, while it has been dwelt upon previously in one way or another, he approached from a novel direction in stressing the importance of the engineer in contributing to the conservation of the great bounty of Nature.

The greatest resources upon which our civilization depends are soil and water, and Nature has always jealously guarded these and maintained her equilibrium therein; but man, when he appeared on the scene, upset this by the clearing of land for cultivation and dwellings, creating, as a result, problems of conserving these two most valuable resources. Irrigation and storage schemes have constituted one attempt to meet these problems, from the great systems of the ancient empires to the tremendous multi-purpose projects of to-day, embodying the storage of water for irrigation, hydroelectric power, flood control and transportation, such as the Tennessee Valley Authority Plan. Such facilities as improvements in dam and canal construction, the use of hydraulic models, geophysics and soil mechanics have aided the solution of many problems; but the inexorable forces of Nature are always at work, and man is reminded of this by the appearance of new difficulties such as the silting up of reservoirs or increasing salinity in irrigation systems by lack of sufficient water. In some areas shortage of water is a grave problem, and the future of water supplies is dependent on the wider acceptance of such techniques as the re-use of water by the treatment of sewage and effluents, or the distillation of sea water, added to which is needed a more thorough knowledge of the behaviour of ground water. Again, where land is valuable, coastal and inland erosion are being curtailed and land is being reclaimed from sea and marsh as in Holland and in the Fens in Britain. In all these efforts, the main problem is to maintain cultivation without loss of fertility in the soil, and in this regard we are gradually learning how to make use of Nature's gifts.

Sir Harold went on to remark that, next to soil and water, energy forms the greatest need of mankind; the consumption of energy per capita determines the standard of living of a country. Here the engineer's role is to increase the efficiency of combustion devices and so effect a saving of such sources of energy as coal and petroleum products, since these provide mankind with a tremendo amount of energy; but with the advent of nucle power man will be able to utilize these more for the chemical potentialities than before.

The conservation of raw materials and the economical use form one of the engineer's mo notable contributions to-day. New methods treating raw materials, such as the economic recove of low-grade ores, have advanced greatly during t past two decades. In the field of structural engi eering, a saving of steel has been effected by t increasing use of concrete and by new concepts structural analysis, such as the plastic method design, developed in the Engineering Department Cambridge, with the advance of new structural ste forms. Improvements in the working of metals a developments in lubricants and anti-corrosives ha resulted in further economies. Finally, there is t greatest economy of all, that of human labour the use of automatic control and the possibilities the automatic factory; here Sir Harold direct attention to the fact that, while control engineeri is making great advances abroad, more recogniti needs to be shown in Britain in this field.

In his closing remarks, Sir Harold drew thr important conclusions: first, progress needs speci ization, coupled with a wide outlook and a knowled of other fields of endeavour, for too much speciali tion is dangerous. Secondly, we must work mo closely with Nature in a new partnership ma possible only with the great forces that she encon passes. Finally, there is in each generation a lim to what is possible, and it is imposed by the resour and skills which are available to man and whic with their uneven distribution, must be used to the best advantage with careful planning, for o convenience.

One may feel inclined to think of this Lecture as catalogue of attainments, but it was, in fact, mo than that; it was a timely warning. While man h a creditable record of achievement to look ba upon, he still has to come to work more with Natur for he cannot control her. Only then will he be ab to use and enjoy the great endowment of her resour which has come to be his heritage.

E. T. HOLMGREN

# TOWNS AND THEIR HINTERLANDS

SINCE its inception in 1941, the Research Ma Office of the Ministry of Town and Count Planning, now part of the Ministry of Housing a Local Government, has carried through a remarkab programme of work. In particular, it has prepar with the joint sponsorship of the Department Health for Scotland the now extensive series National Planning maps on the uniform scale 1 : 625,000, or approximately ten miles to the inc each in two sheets covering England, Wales a Scotland. Civil servants work in anonymity; b it is not difficult to detect the skill and care of t guiding hand of Dr. E. C. Willatts, who has been charge of the work for most of the past fourte ars. Many of the maps have marked new departures cartography, and this is certainly true of the latest dition to the series depicting towns and their nterlands*. It is obvious that every market town ercises a considerable influence on the surrounding untryside, but this 'hinterland' is difficult to define d to delimit. It has little or no connexion with ministrative units, and yet is obviously of great portance in planning the social services to be proded by the urban centre as well as of no little terest in the organization of retail trade and rvices.

The criterion here adopted owes much to the oneer studies of F. H. W. Green, and is that of us services. A town or village is defined as a centre it has operating from it at least one bus service hich serves no place larger than itself. The centres th populations over three thousand (using the 1951 nsus) are represented by an orange circle proporonal to the population, surrounded by a green circle oportional to the population of the hinterland. rm lines mark—perhaps with a firmness their adowy nature does not warrant—the boundaries the hinterlands. In general terms, the people ving within a given hinterland normally visit the ntre shown for shopping, entertainment, cultural d professional services.

So much of the extensive programme of town and untry planning to which Britain is committed is necessity based upon very slight factual knowledge, d such attempts as are illustrated by this map to troduce a scientific objectivity are entirely praiseorthy. Though the centres are smaller and the nterlands are larger in the sparsely populated parts the country, what strikes one is the relatively ven spacing of the centres. In days of old when eople walked to market (or the richer rode on horseack), the effective hinterland of a market town had radius of about four miles. It still seems to be ly about six miles. Over much of England the ntres tend thus to be ten to twelve miles apart. is more in Wales and Scotland.

L. Dudley Stamp

# LIBRARIES OF THE DYESTUFFS IVISION OF IMPERIAL CHEMICAL INDUSTRIES, LTD.

## NEW BUILDING AT BLACKLEY

THE new library building of the Dyestuffs Division, Imperial Chemical Industries, Ltd., as opened at Blackley, Manchester 9, on June 27 by r. Clifford Paine, development director of Imperial hemical Industries, Ltd., and until recently chairan of the Division. Mr. Paine said that a first-class cientific library is the core of a research organization nd expressed the hope that the new building will rovide the conditions which will stimulate creative ork in the minds of those who are expected to make he discoveries of to-morrow. Although the value of ibrary and related services has long been recogized in the Dyestuffs Division, it is only with its removal in May 1955 to the present building that the Main Library of the Division has been housed in premises worthy of its holdings and the services provided. The Divisional libraries hold a total of nearly forty thousand bound volumes (of which about half are periodicals), together with about twenty thousand pamphlets and miscellaneous publications, some fifteen hundred bound volumes of patent specifications and several hundred unbound specifications. About half the total collection is housed at Hexagon House, Blackley, where the collection in organic chemistry and related subjects is probably one of the finest in Great Britain. More than a thousand current periodicals are taken, and about half of these are bound.

The present library collection goes back to the days before the formation of Imperial Chemical Industries, Ltd., the nucleus being provided by the libraries maintained by Levinstein, Ltd., of Blackley, and British Dyes, Ltd., of Huddersfield; the bulk of the latter forms the nucleus of the branch library now maintained at Huddersfield, just as that of Scottish Dyes, Ltd., later formed the nucleus of the Works Library at Grangemouth, Stirlingshire. In 1925 the Levinstein collection was moved into the block of buildings which now houses the administrative offices of the Dyestuffs Division, being transferred in 1932 to a new wing specially designed to be permanent quarters. This was evacuated on the outbreak of war in 1939 and, after two years in makeshift premises in a local school, the Library was moved into a temporary single-story building adjacent to the Research Department of the Division. The library organization includes a Records and Reports Section which is responsible for the care of most of the Dyestuffs Division's permanent technical and commercial records and reports, of which about a hundred and fifty thousand different documents are at present filed; a Technical Section, which collects and indexes technical data of various kinds; and a Commercial Library, not housed in the new block, but situated adjacent to the Sales Departments in Hexagon House, which also collects commercial data.

The new library building, which connects two existing research blocks, has four main floors and a top floor that is occupied by a lecture theatre seating 156, most of the seats being provided with writing flaps. Of the total floor area of 17,000 sq. ft., 2,500 sq. ft. is occupied by the lecture theatre and ancillary rooms, 3,000 sq. ft. by the ventilating plant, corridors, lift, etc., and 2,000 sq. ft. by the basement store. The Main, Technical and Patents Libraries and library offices occupy 5,500 sq. ft., the Records and Reports Section 1,600 sq. ft., and general administration and workshop 1,200 sq. ft. All are characterized by light and spaciousness; the Main Library, on the first floor, measuring 75 ft. by 45 ft., has good north and south lighting and seating accommodation for forty. Shelving and reading space are arranged in the form of alcoves, and shelving and furniture are in walnut, many of the individual tables provided having built-in table easels.

The Technical Library on the ground floor has about one-third the area of the Main Library, and seating accommodation for twelve. It is equipped with cream-coloured steel adjustable shelving, and tables and chairs in natural oak. Adjacent to it is a workshop equipped for repair work on books and pamphlets, cover and case making, report binding and parcelling, and a small dark room off the workshop is equipped with photocopying apparatus. Off the Main Library, on the first floor, there is a small room for storing and reading microfilms. On the second floor there are the main files of the Records and Reports Section, the index room and the collection of British and foreign patent specifications.

---

# ENERGY VALUE OF FOOD

To determine the number of calories that a known weight of food will give when it is burned in a bomb calorimeter is relatively simple; but to assess accurately the number of calories that the animal body can derive from that food presents several problems which have not yet been satisfactorily solved. The subject was discussed at a symposium arranged by the Scottish Group of the Nutrition Society and held at the Hannah Dairy Research Institute, Kirkhill, Ayr, on April 30. The morning session was devoted to methods of assessing the energy of feeding-stuffs for animals, and the afternoon session to the problem as it concerns food for man. At intervals during the day some of the work in progress at the Hannah Institute on the production and emission of heat by farm animals was demonstrated.

In introducing the subject the chairman, Prof. R. C. Garry (University of Glasgow), stressed the danger of regarding food simply as though it were fuel for a machine. Food is much more than fuel, and the animal body much more than a machine. Food has to build, repair and maintain the fabric of the body as well as supply it with energy for work, and the body, unlike the machine, processes its fuel in digestion, absorption and metabolism. The content of minerals, vitamins and other substances present may all affect the energy value of the food by influencing the well-being of the animal, and in man the matter is still more complicated since social habit, beliefs and prejudices may all play a part. The chemistry of a foodstuff must be thoroughly understood: in time the biochemical processes by which energy is liberated from it will be elucidated; but it will still be essential to consider the living animal as a biological entity.

The first paper of the morning session was a joint communication by K. L. Blaxter and N. McC. Graham, who first dealt briefly with the history of methods of evaluating foods as sources of energy for livestock. They pointed out that reliable values are needed for planning livestock production both at farm and at national level, since on such values depend in large measure the animal product output of farming as a whole and estimations of the quantities of feeding-stuffs that must be imported. The second point they made was that measures of the energy value of foods are biological measures and cannot be expected to have the precision usually associated with the physical term 'calories' in which they are presented. Their statement that the efficiency of an animal in utilizing its food necessarily influences the nutritive value of the food it consumes emphasized this point, and was a theme that recurred time and again during the subsequent discussions.

Referring to the different ways in which the energy value of food for cattle is expressed, Blaxter and Graham emphasized the fact that, in order to estimate the value in terms of body storage of energy or in terms of energy transference to milk or eggs or its utilization for work, it is necessary to take into account the heat production incidental to the consumption of the food. For this reason the term 'net energy' or 'starch equivalent', as it is termed Britain, which takes this heat production in account, is superior to expressions of energy value terms of 'digested energy' or 'metabolizable energ Methods of determining net energy were th considered, and slides were shown illustrating t various types of respiration calorimeter in use different parts of the world. The difficulties involv in interpreting the older calorimetric observatio made with cattle and sheep, and indeed those present being made by Blaxter and Graham at t Hannah Institute, were then considered. The effe of plane of nutrition and the type of basal ration use was discussed, and the fact that very small analytic and instrumental errors become greatly magnifie by the very nature of the differential methods computing the results was emphasized. Blaxter an Graham showed that, though well-known text-boo and feeding-stuff tables quote energy values of som 250–300 foods, sixty years of work at Möcker experimental station in Germany, where almost a this work has been done, deal with but thirty-seve foods in seventy-one experiments. Most of the value in the tables are therefore computed values, an recent work has shown that the accuracy of the estimations is frequently very low. Finally, Blaxt and Graham deplored the tendency of workers in th field during the past fifty years—admittedly with few exceptions—to become involved in many point of minor importance and to spend much time on wha is nothing more than arithmetical re-expression the results obtained by Kühn, Kellner and Armsb without contributing in any way to a deeper knowledge of the subject. They regard it as imperativ that an end should be put to recalculating Kellner' results of 1900–5 and that emphasis should b placed on new experiments carried out in the ligh of modern knowledge of intermediary metabolism and with modern equipment.

The discussion was continued in a second paper b Dr. J. C. D. Hutchinson (Poultry Research Centre Edinburgh), who dealt with the reasons why there ha been so little progress in assessing the energy value o feeding-stuffs in spite of the great scientific, economi and practical importance of the subject. He referre to the great difficulties involved and the slowness o this type of work, and cited experience with th Danish calorimeter for cattle with which he is personally acquainted, where the output over a lon period averages one result per worker per year Dr. Hutchinson referred to some ways in which greater output could be obtained—by adopting mor automatic methods of measuring heat loss, by dispensing with the necessity of simultaneous estimates o carbon, nitrogen and energy retention and possibly by using methods involving carcase analysis or body-water determinations. He agreed with Blaxter an Graham that a more fundamental approach with les of the empiricism that has necessarily characterize the earlier work would prove most profitable in th future.

In the afternoon session Dr. E. M. Widdowso (University of Cambridge) mentioned that, until th Second World War, the energy values of food fo man appeared to be of interest chiefly to compilers o food composition tables; but early in the War it wa found that calorie calculations made on the two side of the Atlantic did not agree, and this led to a bette realization of the great practical importance of th subject. Dr. Widdowson discussed several tables o food composition published during the past fifty ars and stressed that, although the methods of mputation vary considerably for different tables, one of them appears to be correct. All are based on ork done half a century ago in Germany by Rubner d in the United States by Atwater, who had been pupil of Rubner. Both these early pioneers measured e intakes of protein, fat, carbohydrate and calories people on different diets and estimated the calories st in the fæces and urine. From their results they lculated the energy values of individual foods and mixed diets. In 1899 Atwater and Bryant concluded that protein and carbohydrate each give 4·0 al./gm. of total nutrients, and fat 8·9 kcal./gm.; d yet a few years later when they compiled tables food values for the composition of several thousand odstuffs, they used Rubner's earlier figures of 4·1 r protein and carbohydrate and 9·3 for fat—a range inconsistency which they did not explain nd which was the forerunner of many others by ter compilers of food tables. Indeed, throughout e years as one error was corrected another appeared creep in. Even as recently as 1947 the committee n calorie conversion factors and food composition bles of the United Nations Food and Agriculture rganization, in calculating the calories per gram of gested protein, failed to apply properly a simple orrection factor for the amount of unoxidized aterial excreted in the urine, and thus, while nproving some portions of the general computation, ntroduced a new error in another portion.

Towards the end of her paper Dr. Widdowson welt on the great need for further experiments with nixed diets more typical of those eaten to-day than vere the diets studied by Atwater. She also stressed he need for experiments to be done with larger umbers of people so that more information can be btained regarding the sort of variation that normally xists between individuals in the number of calories hey obtain from their food. She referred briefly to he need for evolving methods by which the physiological energy value of food in infancy and during rowth can be assessed. She readily admitted that nany mistakes have been made in computing the nergy values of human foods; but endeavoured to onsole herself and those present by recalling that he vho makes no mistakes rarely makes anything—ertainly not food tables.

The second paper of the afternoon session was given by Miss D. F. Hollingsworth (Ministry of Agriculture, Fisheries and Food), who carried the general problem to its next stage by discussing the lifficulties which are encountered in interpreting ables of food composition and in using them to stimate the energy value of human diets. For xample, before the energy values given in tables an be applied in practice it is essential to consider now much of the purchased food is edible, how much water it contains, how much is lost in cooking and serving, and, as Miss M. Andross pointed out later in the discussion, how much is left as waste on the plate. To take one example, the moisture content of flour in food tables is usually assumed to be 12 per cent whereas in Britain for other purposes it is more normally taken as 15 per cent; this leads to a difference of roughly 3 per cent in the calculated energy value of the flour. Again, the fat content of meat can vary over a very wide range, and this can have a marked effect on the energy value computed for it. With made-up dishes the problems become still more involved, and in estimating requirements at an international level further complications arise when figures, which have been computed for British food supplies, are used for estimating the requirements of other countries where higher proportions of the total energy of the diet may be supplied by carbohydrates.

The four papers and the subsequent discussion achieved what was no doubt one of the main objects of the symposium, namely, to bring out some of the numerous difficulties that arise when attempts are made to assess accurately the energy values of foods, and to indicate some of the numerous problems that still wait to be solved by chemist, biochemist, physiologist and dietitian, as well as by those whose difficult duty it is to consider the general subject of world food supplies, their economics and distribution.

# CHEMICAL ASPECTS OF SEMICONDUCTORS

A HALF-DAY symposium on "Chemical Aspects of Semiconductors" was held in the Chemistry Department of the University of Reading on March 26. The meeting, which attracted a gathering of some two hundred, was arranged by Dr. P. F. Holt (Reading) on behalf of the London Section of the Royal Institute of Chemistry. The chair was taken by Dr. F. S. Stone (Bristol). The aim of the symposium was to bring to the attention of chemists some of the problems of a chemical nature arising in the semiconductor field. The rapid developments in the technology of semiconducting materials which have taken place during the past ten years have only been achieved by close co-operation between the chemist and the physicist, and it is important that from time to time the current chemical problems in this predominantly physical field should be presented in a chemical forum. There is, moreover, a growing awareness among chemists of the contribution which semiconductors can make to fundamental studies on essentially chemical problems, such as adsorption and chemical bonding in solids, and this factor no doubt added to the general interest which the meeting aroused.

Since many of those present were not specialists in the semiconductor field, the main contributions were preceded by some introductory remarks on semiconductors, given by Dr. F. S. Stone. After outlining the principles underlying intrinsic and impurity semiconductivity, Dr. Stone dealt briefly with the rectifying and transistor action of germanium. In reviewing the chemical aspects, he stressed the importance of purification and standardization of materials. The significance of adsorption of active gases and vapours in creating a space charge at semiconductor surfaces was also emphasized, and attention was directed to the fact that very little fundamental work has so far appeared on adsorption at silicon and germanium surfaces.

The first of the more specialized papers was read by Mr. I. M. Ross (Services Electronics Research Laboratory, Baldock), who reviewed work on intermetallic semiconductors. Useful as silicon and germanium are for crystal-valve applications, their characteristics in respect of the combination of carrier mobility and separation between the valence and conduction bands are not entirely satisfactory. For other applications, such as photo-devices, quite different characteristics may be required. Interest has therefore turned to the closest analogues of silicon and germanium, namely, compounds between elements in Group III and Group V (for example, InSb, GaAs) crystallizing in the zinc blende structure. Like the purely covalent germanium and silicon, the bonds in these 'III/V compounds' are also mainly homopolar. Mr. Ross pointed out that the band-separation in these compounds covers a wide range of values and that electron mobilities are in general high. With InSb, for example, which has been the most widely studied of these compounds, the electron mobility is 65,000 cm.$^2$/volt-sec. at 300° K., compared with 3,600 cm.$^2$/volt-sec. for germanium. The band-separation in this case is too low for transistor action at room temperature, but the high mobility has led to a number of new applications, particularly concerned with the Hall effect, in which the available power is some three hundred times that given by germanium. Mr. Ross demonstrated this to the meeting by showing the effect of the earth's magnetic field upon the current flowing in a crystal of InSb. He also outlined some of the technical problems associated with producing crystals of III/V compounds. Zone-refining (see below) is in general difficult to apply to these compounds due to their tendency to decompose, and, with the exception of InSb, the problems of purification and growth of single crystals have not been satisfactorily solved. In GaAs, for example, reliance has had to be placed on extensive purification of the parent elements. A further problem, the study of which has only just begun, is that of obtaining stoichiometry in these compounds.

A contribution which aroused much interest was made by Mr. A. A. Smales (Atomic Energy Research Establishment, Harwell), who reviewed methods for estimating trace impurities. Besides sensitivity, specificity and accuracy, Mr. Smales classified the various methods according to their advantages in respect of freedom from contamination (either adventitious or from reagents) and their ability to deal with several elements simultaneously. Emission spectroscopy has this latter advantage and is highly specific. Freedom from contamination may be avoided if the material is examined directly, but not if impurities have been chemically concentrated before determination, to enhance the sensitivity. The most sensitive methods are undoubtedly the isotope dilution technique, employing mass-spectrometric analysis, although the contamination problem still exists there, and the radioactivation method, which involves neutron irradiation in a pile followed by radiochemical separation. For many elements these methods have sensitivities better than 1 part in $10^9$. The first technique is applicable only to those elements for which separated isotopes are available, while the second is limited to those with suitable nuclear characteristics; nevertheless, more than half the elements can be determined by one or the other method. Both require that elements be analysed individually, though the development of gamma-ray spectrometers will ultimately enable the radioactivation technique to be more versatile in this respect. Using the vacuum-spark ion source, the mass spectrometer may be applied to the determination of several elements simultaneously, but the sensitivity is greatly reduced. Mr. Smales also described the more conventional methods, such as colorimetry and polarography, pointing out that although they are fairly sensitive (0·1–1 p.p.m.), the reagent blank problem remains a major limitation.

Mr. H. J. Cluley (General Electric Co., Ltd., Wembley) described chemical processes for obtaining germanium and silicon in high purity. Germanium is extracted as the tetrachloride from coal (flue dust or from zinc blende during smelting. Purification then effected by fractional distillation and refluxin over copper or by repeated distillation. Arsenic, th main impurity, is thereby reduced in concentratio to less than 1 part in 10 million. The metal is obtaine by hydrolysis to germanium oxide and reductio with hydrogen. High-purity silicon may be prepare by fractionation of silicon tetraiodide, followed b the van Arkel technique of thermal decompositio at a hot filament. A second method is the reductio of silicon tetrachloride with zinc in the vapour phase Mr. Cluley also reviewed other methods involvin the thermal decomposition or hydrogen reduction o silicon compounds. Before germanium and silico can be used for electrical work, further purificatio by zone-refining is necessary. The details of thi technique were described by Mr. S. E. Bradsha (General Electric Co., Ltd., Wembley). In zone refining, a molten zone is slowly but repeatedly mad to pass along an ingot of the material. The effect i to concentrate the impurity at one end since, whe an impure solid is melted, the impurity concentratio in the solid ($c_s$) differs from that in the melt ($c_L$ with which it is in equilibrium. If the segregatio coefficient $K$ ($K = c_s/c_L$) is less than unity, the im purity is swept in the direction of traverse. If $K$ i greater than unity, the impurity concentrates in th regions where freezing begins. Unless $K$ happens to b close to unity (for example, boron in silicon), th method is extremely effective and impurity concentrations can readily be reduced to 1 part in $10^9$.

A paper by Mr. J. I. Carasso (Post Office Researc Station, Dollis Hill) dealt with two chemical factor affecting the performance of germanium diodes. Th first of these was the use of nickel as an additive fo the controlled shortening of carrier life-times, a requirement for high-frequency operation. It is found that the addition of nickel to the melt during the crystal-growing stage does not produce the required degree of control, the resulting concentrations o nickel in germanium being different from those expected on the basis of a simple treatment of the segregation coefficient. This anomaly is explained by a suggested diffusion of nickel atoms through the germanium lattice. Direct addition of nickel to germanium by lattice diffusion from a nickel/germanium interface may, in fact, be a more satisfactory method of controlling the incorporation, and Mr. Carasso described experiments of this type at present in progress at Dollis Hill. The second topic treated by Mr. Carasso was surface contamination. Adsorbed gas may exert an influence upon a *p–n* junction due to surface mobility of charged particles. Or again, the space charge arising at the surface may itself be sufficiently intense to form, for example, a *p*-type 'skin' on *n*-type material (channel effect). Thirdly, opportunity is provided for high rates of carrier recombination at the surface. Mr. Carasso discussed specifically the behaviour of water vapour and iodine vapour, showing that the channel effect for water is opposite to that for iodine.

The importance of employing single crystals of a high degree of perfection for semiconductor work is frequently emphasized. This aspect of the field was covered by Dr. E. Billig (Associated Electrical Industries, Ltd., Aldermaston), who gave a descriptive account of the methods of growing single crystals. Among other points, he discussed the correlation of heat dissipation with growth-rate and mentioned at the usual rates, as obtained by the standard yropoulos method, could be considerably increased y undercooling the melt. Melts can be undercooled y as much as 20–30° C. without risk of nucleation. r. Billig showed that if one (111) plane of a ger- anium crystal is maintained vertical, the crystal is le to grow without the need for nucleating new yers; no experimental evidence of growth from iral dislocations has in fact been obtained in this ork. Imperfections, however, do arise, due possibly the occlusion of impurities and to mechanical resses. Such stresses are commonly caused by neven temperature distribution or by certain ystallographic features such as the intersection of vo twin boundaries. A single twin boundary, on the her hand, apparently has no effect on the electrical roperties. Dr. Billig concluded by showing a film ustrating various features in the growth of ger- anium and silicon monocrystals. Under certain nditions, such crystals have been obtained in the rm of thin plates which display a striking degree of xternal symmetry. The film also showed the xtremely rapid growth of dendritic crystals in the rm of thin and long lamellæ, demonstrating in a nvincing manner that, even in an isotropic medium f cubic symmetry, crystal growth can take place by he deposition of individual layers orientated along he close-packed (111) planes.

# STAR-STREAMING FROM STARS OF SPECTRAL TYPES *A* AND *B*

A PAPER by T. R. Tannahill on "Star-Streaming from the Stars of Spectral Type *B*" (*Mon. Not. Roy. Astro. Soc.*, 114, No. 4; 1954) gives the results f his analysis, on Eddington's two-drift hypothesis, f the proper motions of 1,536 stars of spectral types and *B* in the Boss "General Catalogue". The aterial for the investigation was grouped into ten egions, each region consisting of a 'square' of north alactic latitude combined with the diametrically pposite region of south galactic latitude, as shown n the first table of the paper. An examination of his table and also of the drift-curves establishes that t is impossible to represent the motions of the B-type stars by a single drift, and a large proportion f the stars has been assigned to a second drift in rder to make a satisfactory fit; in four out of the en regions in Drift ii the number of stars exceeds hat in Drift i. From an analysis of the data, the rift constants are derived with the probable errors.

In a previous paper (*Mon. Not. Roy. Astro. Soc.*, 12, No. 3; 1952), Tannahill gave the corresponding esults from the galactic zone of stars of types $A_5$–$M$, nd a comparison with the present results indicates atisfactory accordance, considering the probable rrors involved. The values of $L$, $B$ and $hW$, the alactic co-ordinates of each drift apex and the space elocities of each drift, are used to calculate the heoretical values of $hV_c$ and $\theta_c$—that is, the pro- ections of the space-velocities of the drifts on the angent-plane at the centre of the region, and the osition angles of the directions towards the drift pices—and these are listed together with the esiduals $hV_c - hV$ and $\theta_c - \theta$. Considering that only 1,536 stars were used in the investigation, the resi- duals are quite satisfactory except in Drift i, region 5, where $\theta_c - \theta_1$ exceeds 49°. The linear components of the motion of Drift i relative to Drift ii are given in a table, and also the galactic longitude and latitude of the vertex of star-streaming and the relative space-velocity of the drifts. One curious feature is the close agreement of the galactic co-ordinates of the vertex position (343·3°, −1·6°) obtained by the investigation, and that normally found (343°, −2°). It is admitted that the closeness of the agreement must be regarded as fortuitous, on account of the probable errors involved. Nevertheless, this does not vitiate the final conclusion, and the result "removes any shadow of doubt that the *B*-type stars exhibit the phenomenon of star-streaming".

The subject is continued in a further paper (*Mon. Not. Roy. Astro. Soc.*, 114, No. 5; 1954), "Star-Streaming from the Proper Motions of the *A*-Type Stars of the Boss 'General Catalogue' ", in which are given the results of the analysis of the motions of 8,676 stars of the spectral types $B_5$–$A_3$. The method of dealing with the data follows closely that described in the 1952 paper for stars of types $A_5$–$M$, and stars belonging to known clusters have been rejected; of these, twenty belong to the Pleiades group, forty-six to the Ursa Major group, and nine to the Taurid cluster. The same difficulty in analysis arose as with the $A_5$–$M$ stars, the regions around Drift i apex offering certain problems in analysis, especially in the determination of the Drift ii constants. The higher concentration of the stars in the galactic plane, the regions in the higher galactic latitudes being sparsely populated, presented further difficulties; but in spite of these, analysis was possible in all regions, and the results are given in nine tables.

One rather surprising feature may be mentioned: in the $A_5$–$M$ types there was a marked decrease of $hW$ with advancing spectral type, which was not maintained in the *A*-stars. There was a decided systematic change in the Drift ii apex, the right ascension decreasing, and the declination increasing, with advancing type. In addition, large and apparently irregular variations occurred in some of the quantities determined, and, judging by the probable errors involved, must have a statistical significance, yet they indicated no systematic trend. Some possible reasons for these discrepancies are suggested by Tannahill, and though they are only tentative, it is probable that future research will modify some of the hypotheses on which present investigations are based. The galactic co-ordinates of the vertex were found to be (365·5°, −0·5°), and the equatorial co-ordinates of the solar apex (264·8°, +31·5°); the latter is not far from the co-ordinates of the solar apex as found from the streaming of the spectral type *B* stars (260·7° + 37·3°).

---

# THE INSTITUTE OF SEAWEED RESEARCH

IN the annual report for 1954 of the Institute of Seaweed Research, the interested layman's attention will be attracted by the statement that "mechanical harvesting of sublittoral Laminariaceae has now been proved to be a feasible and reasonably cheap operation". At present, six seaweed-processing factories in Scotland use more than 30,000 tons of cast weed annually, and it is estimated that one motor fishing vessel adapted to operate twin I.S.R. belt harvesters should be able to collect more than five thousand tons of *Laminaria cloustoni* a year in good areas. One of the main objectives of the Institute has therefore been attained and the advantage to the seaweed industry of planned collection of the material over cast weed is obvious.

If mechanical harvesting has been the limiting factor in the industry up to the present, its adoption may bring fresh problems. If it becomes regular practice, limited in the main by the state of the weather and sea only—it is suggested that harvesting on at least 170 days a year is a reasonable assumption—it becomes important to assess the effects of harvesting on the density of the beds of *Laminaria cloustoni* as well as on the associated fauna and flora. The same report indicates that changes in the density of these beds occur from year to year when they are subject to natural conditions only, and hence it is reasonable to ask what effect harvesting will have on them.

Processes for the manufacture of mannitol, aminarin, calcium alginate and fucosterol have been perfected at the Institute; but whatever products are to be made use of commercially, the industry is in the last resort dependent on a continuing supply of the plant. Experimental work on the effect of harvesting is therefore of prime importance.

KATHLEEN M. DREW

# WORK STUDY

IN one of the occasional papers published by the Institute of Personnel Management, a useful corrective is given to the unfortunate trend in industry which regards work study as the panacea for all industrial ills. Valuable as they are, work study and monetary incentive schemes are techniques which can have the most harmful consequences; they may increase production in the short run (not always in the long run) but at a social and psychological cost which is no less serious because it cannot be immediately perceived. It may be argued that it is unjustifiable to criticize work study together with the use of narrowly conceived incentive schemes, on the ground that there is no necessary connexion between them. There is, of course, no necessary connexion, but, in practice, there has developed a very natural connexion: the increase in repetitive work and the progressive simplification of the job have required that a substitute incentive be found for the satisfaction and skill so often destroyed. Among the many dangers and disadvantages of direct incentive schemes the following seem to be among the most important.

They are sought and used as a substitute for managerial skill in other directions, and they tend to deflect attention from matters which should have a far higher degree of priority in the development of any management policy; for example, production planning and sales/production co-ordination, education and training, method study, and systems of cost control.

The foreman's direct responsibility for output is reduced; this is said to be an advantage in that he is thus enabled to carry out more important duties. In fact, the stresses impinging on the foreman are frequently increased by the introduction of an incentive scheme and become more frustrating and harmful in character.

The impact of incentive earnings on the wages structure can be very detrimental and lead to much discontent. Supervisory differentials and other evaluated jobs are adversely affected by distorted earnings in other departments.

The installation of an individual incentive schem frequently has a disintegrating effect on the workin group which in many cases is resolved by taci agreement among workers to restrict output to a agreed level; this is strongly condemned by management, who fail to understand that in the circumstances it is indispensable for the social equilibrium of the group.

As the whole emphasis of the incentive scheme is o producing the maximum individual reward, the effec is for the incentive bonus to be won regardless o necessary co-operation with supervisors and fellow workers. The quality of production frequently suffers despite careful inspection procedures.

The scientific accuracy of time study has yet to b demonstrated, and the trade unions, aware of th difference in standards between time-study men, ar not slow to take advantage of these opportunities i negotiation; in this respect time study may b regarded as a tool for collective bargaining.

Not the least important is the insidious effect tha incentive schemes can have on the moral qualitie and sense of responsibility of the individual. It i perhaps to be expected that a system which attempt to allocate a precisely defined reward for every action of the individual in his working society should have its repercussions elsewhere.

# CONGENITAL PORPHYRIA IN SWINE AND CATTLE IN DENMARK

By S. K. JØRGENSEN
Thisted Slaughter-House, Denmark
AND
Dr. TORBEN K. WITH
Central Laboratory, County Hospital, Svendborg, Denmark

CONGENITAL porphyria is a rare inborn error o metabolism in man and animals. It is occasionally seen in pigs and cattle in slaughter-houses because of the reddish-brown colour of the bones and teeth; but it has only once been studied in live cattle[1] and live pigs[2]. For further information the reader is referred to the survey by Rimington[3]. It is a puzzling coincidence that congenital porphyria has been found in both pigs and cattle in Thisted County in North Jutland. We are now studying the live animals.

In October 1951 one of us (S. K. J.) found dark bones in pigs at Thisted slaughter-house. This reduced the market value of the pork, and in consequence an investigation was started. The condition could be diagnosed with reasonable certainty on inspection of the colour of the teeth in the new-born pigs; pigs with dark teeth as a rule develop porphyria. After elimination of all pigs with dark teeth, the condition disappeared; since February 1954 no new cases have occurred at Thisted. Two sows with porphyria were transferred to the State Experiment Farm of Faurholm for breeding studies and chemical investigations under the direction of Prof. H. Clausen and a senior experiment officer, N. J. Højgaard Olsen, in collaboration with one of us (T. W.). Some material was also sent to Prof. C. Rimington in London.

The best method of characterizing the severity of porphyria in a pig is quantitative analysis of the eth or bones for porphyrin; for example, the teeth new-born pigs. The analysis is carried out as llows (to be published by T. K. W.[5,6]): The small eth are treated with 0·5 *N* hydrochloric acid, which tracts the porphyrin but not the other dark pig-ents present; the porphyrin is determined spectro-otometrically in the extract by the method of imington and collaborators[4]. Bones are pulverized ith a file, about 50 mgm. of the powder is weighed it and shaken for about a minute with 5 ml. of ·5 *N* hydrochloric acid; after standing for an hour, ntrifugation is carried out and then the determ-ation is made.

The distribution of porphyrin within the skeleton aries considerably. In the compact substance, the oncentration is often five to ten times as high as in ie spongy tissue; and even within the former, ertain zones may contain considerably more than thers—a fact readily seen on direct examination of ie bones in Wood's light. The porphyrin of the eeth is for the main part located in the dentine; the namel contains at the most only traces of porphyrin. 'eeth of new-born pigs with porphyria contain a ark non-porphyrin pigment besides porphyrin, and his is not extracted with dilute hydrochloric acid. lost often dark teeth show definite fluorescence in Vood's light; but occasionally they may fail to do o, and in such cases the extract with 0·5 *N* hydrochloric acid as a rule shows a beautiful red fluorescence. Consequently, a tooth from a new-born pig annot be regarded as porphyrin-free because it fails o fluoresce in Wood's light. Extraction with dilute ydrochloric acid and examination of the fluorescence f the extract is required.

Teeth of new-born pigs contained from a few μgm. orphyrin per gm. in slightly affected animals to 200 gm. per gm. in severe cases; in the bones of adult igs, figures of the same order were found. Lutidine hromatography[5] showed that the porphyrins of the ones and teeth were mainly uroporphyrins, with ninor amounts of coproporphyrins. The most everely affected pigs excreted 1,000–10,000 μgm. of roporphyrin in the urine per 24 hr., the more lightly affected only 100–750 μgm. Besides the roporphyrin, smaller amounts of coproporphyrin vere excreted (about 50 μgm. per 24 hr.). No porpho-ilinogen was found in the urine. Lutidine chromato-raphy[5] on the urinary porphyrins showed the resence of small amounts of porphyrins with three, ive, six and seven carboxyl groups besides the -carboxyls (uroporphyrin) and 4-carboxyls (copro-orphyrin). Dioxane chromatography[6] showed that bout 70 per cent of the uroporphyrin in urine and ones was uroporphyrin I, about 30 per cent roporphyrin III. Paper chromatography of the oproporphyrins[7] showed that the main part was oproporphyrin III.

The health of pigs showing porphyria was very ittle if at all affected, except in the most extreme ases. Photosensitivity of the skin was never bserved. A single boar died spontaneously showing ymptoms of heart failure, which may have been due o porphyria. The heredity of the condition is not uite clear; but our observations point towards a ingle dominant gene, although a more complicated nechanism cannot be excluded.

In cattle, congenital porphyria has turned up ccasionally in Thisted County for at least twenty ears in animals of the Shorthorn breed. In 1952, a armer complained of one of his young cows, that it vas not getting on at pasture but did well in the stable. It was sent to the slaughter-house and found to have dark teeth and bones. One of us (S. K. J.) examined the bones; but they have since been lost except for a tooth which on analysis showed 239 μgm. uroporphyrin per gm. In November 1954, a young bullock with discoloured teeth was found on a veterinary inspection of livestock. This bullock and its dam were sent to Svendborg for chemical study. The cow was found to be free from porphyria whereas the bullock excreted large amounts of porphyrins with urine and fæces, although it was in excellent health and development. A tooth was extracted and showed 77 μgm. uroporphyrin per gm. This tooth was sent to Prof. Rimington in London. The tip of its horn was sawn off, and the tip of the bony core removed showed bright red fluorescence in Wood's light.

The bullock excreted with its 24-hr. urine about 100 mgm. of porphyrin, consisting of about 30 per cent coproporphyrin and about 70 per cent uroporphyrin. The percentage of the total porphyrins consisting of coproporphyrin varied considerably from one portion of urine to the other, the extreme values being 5 and 60 per cent. No uroporphyrin chromogen[7] was found and only 10 per cent or less of the coproporphyrin was excreted as chromogen. Porphobilinogen was present in amounts of 25–50 mgm. per 24 hr. This was demonstrated by a positive Ehrlich reaction, the dye of which was not extracted with chloroform, and it was measured quantitatively as uroporphyrin[8] after boiling at *p*H 5–5·5[4]. This occurrence of porphobilinogen is, if confirmed, rather remarkable, because this compound has not been found in congenital porphyria before. The porphobilinogen excretion was not constant, but intermittent. We have not so far succeeded in isolating the porphobilinogen in a crystalline condition; but we obtained once a purified and concentrated solution by means of Westall's[9] procedure.

The fæces of the bull contained, per gm. of dry substance, 100–250 μgm. of coproporphyrin (extracted from ether with 0·1 *N* hydrochloric acid), 10–25 μgm. of dicarboxyl (proto) porphyrin (extracted from ether with 5 per cent hydrochloric acid), and 50–100 μgm. of the uro-type (ether-insoluble). The latter showed an absorption maximum at 402 mμ in 0·5 *N* hydrochloric acid and is therefore probably not uroporphyrin. The corresponding figures for normal cows in the same stable and on the same feed were respectively 1·0, 3–5 and nil.

Finally, it may be mentioned that a young bull with porphyria was slaughtered at Thisted in January 1955. Its bone contained 94 μgm. uroporphyrin per gm. of the compact substance of the lower jaw; the spongy substance contained only 18–32 μgm. per gm. and a tooth 21 μgm. per gm. After this, a thorough analysis of the cattle of Thisted County based on analyses of fæces and teeth from all animals in stocks where cases have occurred was planned and is now going on. Our studies on the heredity of the condition have so far supported the view of Fourie[1] that congenital porphyria in cattle is inherited as a recessive character—contrary to congenital porphyria in pigs, which is inherited as a dominant character.

In conclusion, we wish to point out that the considerable quantities of porphyrins excreted per 24 hr. by our bullock—200 mgm. coproporphyrin with the fæces, and about 35 mgm. with the urine as well as about 65 mgm. uroporphyrin with the urine—are easily extracted and purified.

Since the bullock is a young and healthy animal, it can be expected to yield large amounts of porphyrin for several years, some of which may be made available as marker substances for paper chromatography and delivered to laboratories concerned with porphyrin analysis. Investigators who may be interested in obtaining porphyrin markers are invited to communicate with us (T. W.) concerning this question.

We wish to thank Prof. C. Rimington, University College, London, for valuable advice and never-failing interest, and the Sales Association of the Danish Export Bacon Factories (Eksport-Svineslagteriernes Salgsforening) and the Co-operative Danish Cattle-breeding Associations (De Samvirkende Kvægavlsforeninger) for financial support.

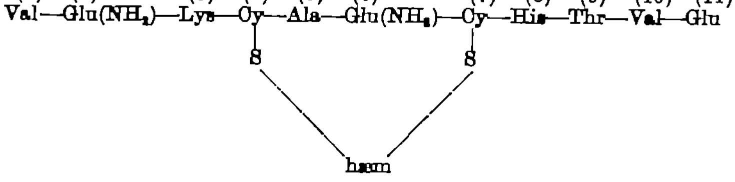
# STEREOCHEMICAL STRUCTURE OF CYTOCHROME *c*

By ANDERS EHRENBERG and PROF. HUGO THEORELL

Biochemical Division, Medical Nobel Institute, and Wallenbergs Laboratory for Physiological Chemistry, Stockholm

RECENTLY, a hæmopeptide obtained by peptic degradation of cytochrome *c* has been purified and its structure determined[1]:



Its physico-chemical properties in the ferric state have been examined in some detail[2] and compared with those of cytochrome *c*[3]. Magnetic measurements revealed that the bonds to the iron were essentially ionic in acid solution, but octahedral $d^2sp^3$ bonds at alkaline reaction. On acidification, the covalent bonds to the hæmochromogen-forming groups are released stepwise, with spectrophotometrically operable *pK*'s of 5·8 and 3·4 respectively; that titrated at *p*H 3·4 is presumably the imidazole residue of histidine (8), while the other one is either the α-amino group of valine (1) or the ε-amino group of lysine (3)[2].

With the aid of a set of steric bond models for building peptide chains with coplanar peptide bonds (generously given to us by Prof. L. Pauling), we have investigated different sterical possibilities for th hæmopeptide. For that purpose a hæm model in th same scale (1 A. = 1 in.) was made from a met disk, and the side chains involved were manufacture from bent metal rods and suitable joints allowin free rotation around the axis of the bonds.

It was assumed that all the amino-acids had th l-configuration. The peptide-chain model was folde to correspond to the various left- and right-hande helix-structures described[4]: α-helix with 3·7 amin acid residues per turn, π-helix with 4·4, and γ-heli with 5·1. Then attempts were made to connect th two cysteine side chains of the peptide with th α-carbon atoms of the vinyl groups in positions and 4 of the hæm disk (two possibilities) and on or two hæmochromogen-forming groups with th iron.

The γ-helix structure could immediately be ex cluded because of strong steric hindrance. With th α- or π-helices, the thioether bonds could always b formed. In these cases the ε-amino group of lysine ( could be attached to the iron; but it was neve possible with the α-amino group of valine (1).

Interest was, however, focused on the imidazol imino group of histidine (8), since there is goo evidence to show that two such groups are hæm linked in cytochrome *c*. With the π-helix this grou could reach the iron only with strain, and the angl between the helix axes and the hæm disk becam about 70°. Both the left- and right-handed α-spiral with the cysteine (4) connected to the side chain of the hæm disk gave rigid but strainless structure with the helix axes very nearly parallel to both th hæm plane and the imidazole plane. Since only th left-handed α-helix has been demonstrated in Nature we believe this structure to be the most probabl one. The α-helix of the hæmopeptide occupies jus one-quarter of the space around the hæm. In cyto chrome *c* at about neutral *p*H it is thus plausible t imagine four such helices arranged symmetricall about the hæm disk, thus shielding it from direc contact with, for example, oxygen, carbon monoxid or cyanide, but, nevertheless, in some way allowin electrons to be exchanged.

The alternatives of 'pleated sheet' configuration in cytochrome *c* looked very improb able for steric reasons.

In the hæmopeptide, two of the avail able hæmochromogen-forming group could reach the iron simultaneousl only if the structure was unfolded t a large extent.

At a low *p*H, no stable links ca be formed between the molecules and the hæmopeptide is no doub monomer. At higher *p*H, covalent bonds to the iro might be formed both intra- and inter-molecularly The fact that the hæmopeptide is precipitate between *p*H 4·4 and 7·1 may be due to a combine effect of such intermolecular bonds and the proximit of the isoelectric point (about *p*H 5). At an alkalin reaction the hæmopeptide is again soluble and hæmo chromogen formation is complete[2]. In the case o the rigid α-helix structures it is not possible for bot the iron-linked groups to be bound intramolecularly and some kind of polymerization must take place For steric reasons it would be expected that on or more types of polymers would be preferred In the case of an unfolded structure, however, polymerization would be much less favoured and irregular.

In order to study the molecular weight of the mopeptide under different conditions, we have rried out some sedimentation experiments in a inco ultracentrifuge. We obtained sedimentation nstants of 0·6 *S* at *p*H 2·3 and 1·6 *S* at *p*H 8·7. both cases the hæmopeptide appeared to be almost onodisperse. The molecular weights could be timated as 2,000 and 11,000 respectively, while the rmula of the hæmopeptide corresponds to *M* = 80. The existence of a monodisperse penta- or xa-mer at alkaline reaction thus strongly supports e existence of a rigid helix structure.

Tuppy and Bodo[5] added increasing amounts of stidine at *p*H 7 to the reduced form of hæmopeptide tained by tryptic digestion of cytochrome *c* and served absorption bands approaching the extinon coefficients of ferrocytochrome *c*. By adding 14 *M* histidine to a solution of the peptic hæmoptide at *p*H 8·7, we obtained a spectrum nearly entical with that of ferrocytochrome *c*. This sugsted that the free histidine competitively replaced e bonds causing the polymerization. To test this ssibility, an ultracentrifugal experiment was rried out under the same conditions and it showed at the sedimentation constant had in fact decreased om 1·6 *S* to 0·8 *S*. The depolymerization effected histidine was probably incomplete, since the emopeptide appeared to be slightly polydisperse.

In order to illustrate further the hæmochromogenrming capacity of the groups considered, a spectrootometric study of ferri- or ferro-protohæm plus stidine, lysine or glycyl-glycine was made at *p*H 7. ith lysine or glycyl-glycine, no reaction was served. This was not unexpected, since the *pK* of imary amino-groups is between 8·5 and 10·5. istidine, on the contrary, has a *pK* of 6·1, and two olecules of the histidine combined simultaneously ith one molecule of the protohæm ($n = 2$). The sociation constants for the histidine protohæm mpounds were found to be $K_{\rm ox} = 0·004\ M^2$ and $_{\rm red} = 0·015\ M^2$ at 20° C. Our result, $n = 2$, is in e with the findings of Cowgill and Clark[6], who udied the combination of several imidazoles with rri-mesoporphyrin. The fact that $n = 2$ also in tochrome *c*[7] cannot of itself be taken as an evidence at the iron-linked groups are identical. The present monstration of the much higher ability of histidine form a hæmochromogen at *p*H 7 as compared with her amino-acids must, however, be considered as rong support for the view that both the ironked groups of cytochrome *c* really are histidine idazoles. Furthermore, Margoliash recently found at two of the four imidazoles in horse cytochrome *c* not react with dinitrofluorobenzene[8].

It is interesting to notice that the isolation of a ptide fragment with eleven amino-acids, two or ree of which are attached to a hæm molecule in a own way, has made it possible to make predictions ncerning the sterical structure of the undegraded otein, without the aid of X-ray investigations.

A detailed report of this work will be presented in *cta Chemica Scandinavica*. [March 30

# AGES OF PITCHBLENDES BY X-RAY DIFFRACTION

By DR. B. WASSERSTEIN

**Geological Survey, Pretoria**

IN a recent communication in *Nature*[1], it was shown how uraninites, essentially $UO_{2\pm x}$, could be classified into three mineralogical types, and that two of these fitted into a scheme of age determination based on progressive shrinkage of the unit cell. The third type, β-uraninite, or better known as pitchblende, was discarded as unsuitable.

Further work on pitchblendes supports this general conclusion—with certain qualifications. Relatively young pitchblendes give slightly lower cube-edges, that is, higher ages, than normal; but older pitchblendes can be accommodated within the new scheme of age determination. The explanation for such results may be found in the varying poor crystallinity of the pitchblendes. Like glass, which devitrifies with time, the older samples seem more amenable to a method relying on crystallographic measurements. Defective crystal lattices can be expected to occur in material which often appears glassy or shows signs of a colloidal origin.

Even in a scheme of age determination by X-ray diffraction, pitchblendes, although scarcely qualifying as crystalline, could not be entirely ignored. Their X-ray spectra are unsatisfactory for measurement. Heating produces a sharper spectrum, and, as uranium oxide is known to be stable in hydrogen even above 1,000° C., it is argued that ignition in hydrogen of pitchblendes would remove their characteristic excess of oxygen to give the required α-type, the parameter of which serves as the criterion of age. From the classification data previously presented[1], it was predicted that this ignition would increase the parameters of pitchblendes, and this was, in fact, observed.

| Locality | Before ignition | After ignition |
|---|---|---|
| Gilpin, Col. | 5·42 A. | 5·443 A. |
| Cornwall | 5·40 ? A. | 5·455 A. |
| Viseu, Portugal | 5·40 ? A. | 5·443 A. |
| Joachimstal, Czechoslov. (several samples) | 5·41 A. | 5·435–5·448 A. |
| Příbram, Czechoslov. | 5·41 A. | 5·448 A. |

The error in some determinations approached 0·01 A.; nevertheless, it is clear that ignition markedly increased the cube-edges; but they mostly fall short of the anticipated values around 5·46 A. (Other types of uraninites when heated *in vacuo* or in different atmospheres show a *decrease* in the cube-edge value.)

These results show that the transition from β- to α-type takes place as predicted. The value from the Cornwall sample, suggesting an age around 400 million years, may be correct within the experimental error; but the higher ages, that is, the lower cube-edge values, may be due to such crystal defects as vacant uranium atom positions, or replacements of uranium. In the Gilpin sample, such replacement by the small ions zirconium and titanium may well account for the abnormal reduction in cube-edge.

Turning to older pitchblendes—and the method primarily aims at establishing pre-Cambrian data—it became desirable to compare both an α-type and a pitchblende (that is, β-type) from the same deposit in the hope of cancelling out any major effects due to differences in age or composition. Only from one locality were both types available for investigation, namely, from the Rhokana Mine, Kitwe, Northern Rhodesia. Differences in these two types cannot entirely be ruled out, but similar results would suggest that these differences were negligible. The results obtained were:

RHOKANA MINE

| | |
|---|---|
| Untreated pitchblende (that is, $\beta$-type) | 5·417 ± 0·007 A. |
| After 1 hr. in hydrogen at 950° C. | 5·443 ± 0·004 A. |
| Untreated $\alpha$-uraninite | 5·453 ± 0·003 A. |
| After 1 hr. in hydrogen at 950° C. | 5·447 ± 0·003 A. |

The agreement after heating is highly satisfactory. It is likely that minor alteration has increased the untreated α-type—this phenomenon is commonly encountered in γ-types (paper in preparation) when oxygen enters the crystal lattice interstitially.

The slightly lower value for the heated pitchblende sample when compared with the α-type is not unexpected in view of the previously mentioned findings. The value for the untreated α-type agrees with the 'chemical age' of 520 million years reported by Davidson[2], while the parameter obtained after heating is identical with that found for the Belgian Congo α-uraninite and therefore has an age of 620 m.y. The data at this stage are not sufficient to decide the issue; but they clearly indicate this narrow range in ages.

The real significance of the Rhokana results is that they show the relationship between α- and β-types to be as presented in my classification, and thereby a procedure in obtaining ages from pitchblendes by X-ray diffraction is indicated.

With this background the method was applied to two relatively older pitchblendes the ages of which are more precisely known from isotope measurements—such material is difficult to find. Exceptionally, sufficient material was available for differential thermal analyses by Mr. E. R. Schmidt of this laboratory, and this investigation supported their classification as β-types.

## (A) Madagascar

Through the kindness of one of the authors, Dr. H. Besairie, of a recent publication on the ages of radioactive minerals of Madagascar[3], I secured a duplicate specimen of the Bemasoandra uraninite, the lead isotopes of which, determined by Nier, gave the following results:

| $^{207}$Pb/$^{206}$Pb | $^{206}$Pb/U | $^{207}$Pb/U | $^{208}$Pb/Th |
|---|---|---|---|
| 480 ± 20 | 390 | 410 ± 4 | 465 ± 2 |

The real age taken by the authors from these data is 480 ± 15 million years.

The X-ray results were as follows:

BEMASOANDRA

| | |
|---|---|
| Untreated pitchblende | 5·444 ± 0·003 A. |
| After 1 hr. in hydrogen at 950° C. | 5·459 ± 0·003 A. |
| After correcting for thoria | 5·455 ± 0·003 A. |

The parameter 5·455 A. becomes the criterion for age. As the shrinkage of the cube-edge with time is about 0·0035 A. per hundred million years, it follows that the Bemasoandra β-uraninite is just 200 million years younger than the well-authenticated age for Belgian Congo (see table), so that the X-ray results therefore give an age of 420 million years.

The experimental error is probably less than 100 million years, and the agreement with the age from isotopic data is as good as can be expected. This result is important in supporting the reasonii adopted in this investigation.

## (B) Great Bear Lake

The age of the well-known pitchblende from th Canadian locality is now accepted as close to 1,4( million years[4]. Marble[5] has shown that thoria absent and that the rare-earths are of minor si nificance; in the α-uraninite derived from th pitchblende, only radiogenic lead will therefore affe the cube-edge.

This pitchblende differs from those of its group it is the only one which showed a reduction in cub edge after ignition in hydrogen. It is suggested th weathering increased its cube-edge due to the intr duction of interstitial oxygen. The X-ray data foun were as follows:

GREAT BEAR LAKE

| | |
|---|---|
| Untreated pitchblende | 5·453 ± 0·004 A. |
| After 1 hr. in hydrogen at 950° C. | 5·421 ± 0·003 A. |

These results were duplicated under slightl differing conditions; the spectra obtained were ver satisfactory and the chemistry of the material well known—these factors suggest a high accurac in determination. The parameter 5·421 A. indicat an age just over 300 million years greater than th well-established age for Wilberforce, Ontario. Th X-ray data therefore give an age of 1,350 ± 5 million years.

The agreement with the age determined by mea of isotope data can scarcely be bettered.

Considering the kind of material that pitchblend represent, it is remarkable that one can recogni with the aid of X-rays such a degree of order i them. Their relationship to the better crystallize members of this mineral group now finds a sati factory explanation, and their study completes th picture of the uraninites and their age determinatio by means of X-rays. By inserting the two newl found values for the two pitchblendes from Mad gascar and Great Bear Lake in the previously pu lished table, perfect fits are obtained which great strengthen the chain of results—almost halving th gap between 1,000 and 2,000 million years. Th augmented table now reads:

| Samples | Types | Isotope ages | Cube-edges (corrected for thoria) |
|---|---|---|---|
| Uranium oxide—artificial | $\alpha$ | Zero | 5·470 A. |
| Connecticut, U.S.A. | $\alpha$ | 250 m.y. | 5·463 A. |
| *Madagascar* | $\beta$ | 480 ± 15 m.y. | 5·455 A. |
| Belgian Congo | $\alpha$ | 620 m.y. | 5·448 A. |
| Bisundni, India | $\alpha$ | 735 m.y. | 5·443 A. |
| Gaya, India | $\gamma$ | 955 ± 40 m.y. | 5·436 A. |
| Wilberforce, Canada | $\gamma$ | 1,035 m.y. | 5·432 A. |
| Gordonia, S. Africa (Mountain) | $\alpha$ | 1,025 m.y. | 5·428 A. |
| Gordonia, S. Africa (Holmes) | $\gamma$ | 1,025 m.y. | 5·427 A. |
| *Great Bear Lake*, Canada | $\beta$ | 1,400 m.y. | 5·421 A. |
| Witwatersrand, S. Africa | $\gamma$ | 2,000 m.y. | 5·400 A. |

An interesting fact that can be read from th table is that the exploited deposits of the Belgia Congo, Great Bear Lake and the Witwatersran yield, respectively, α-, β- and γ-uraninite. [Feb. 5

## Macromolecular Weight and Size of Deoxypentose Nucleic Acids

RECENT measurements of the weight of deoxy-ntose nucleic acid molecules extracted from calf ymus[1], pneumococcus-transforming principle[2] and . *coli*[3] have yielded values close to six million. The ssibility of a constant molecular weight with its nsequent implications has already been noted[1].

We therefore report the results of some preliminary ght-scattering studies of the molecular weight and ze of specimens of deoxyribonucleic acid from ifferent sources, which were subjected to preparative rocedures as nearly identical as possible. These ield a wide range of values, the molecular weight ncreasing markedly with the guanine content, as hown in Table 1.

able 1. MOLECULAR WEIGHT AND SIZE OF DEOXYRIBONUCLEIC ACID MOLECULES IN 0·2 *M* SODIUM CHLORIDE, *p*H 6·8

| Source | Base ratio $\frac{\text{adenine}+\text{thymine}}{\text{guanine}+\text{cytosine}}$ | Guanine content (moles/100 moles nucleotide) | Molecular weight ($\times 10^{-6}$) | Molecular radius of gyration (A.) |
|---|---|---|---|---|
| *Arbacia lixula* | 1·59[5] | 17·5 | 2·3 | 1590 |
| Calf thymus | 1·32[5] | 21·5 | 6·0 | 2240 |
| *E. coli* | 1·0[5] | 24·0 | 9·1 | 3500 |
| Avian tubercle bacillus | 0·4[5] | 37·0 | 14·4*<br>12·5† | 2300*<br>1400† |

* Specimen (1), fibres kept in solvent for three days prior to final ntrifugation.

† Specimen (2), fibres kept in solvent for eight days prior to final ntrifugation.

Calf thymus deoxyribonucleic acid was prepared by e method of Schwander and Signer[4]. Other speci-ens of deoxyribonucleic acid were obtained from *rbacia lixula* sperm, *Escherichia coli* B. and from vian tubercle bacilli, as outlined below. These were odifications of the methods used by Chargaff *et al.*[5] nd Zamenhof *et al.*[6]. The washed sperm and micro-ganisms, after the latter had been ground with umina or glass powder in a vibratory ball mill, were xtracted three times with 3 *M* and 1·7 *M* sodium loride respectively. After clarifying by centrifuga-on, the crude material was precipitated three times in 0 per cent alcohol at – 20° C. Proteins and ribo-ucleic acids were removed by Sevag's[7] procedure nd by treatment with ribonuclease and dialysis gainst 10 per cent sodium chloride. After further recipitations in alcohol, the specimens were stored 70 per cent alcohol at 4° C.

After extraction, the fibres were allowed to swell 0·2 *M* sodium chloride, *p*H 6·8, for 48 hr. before lending for 30 sec. at 10,000 r.p.m. The solution was ien shaken for 16 hr. and finally spun in a Spinco ltracentrifuge at 30,000 r.p.m. (mean centrifugal eld 60,000 *g*) for 3 hr. Particular attention was given the identity of these procedures, all of which were rried out at 4° C.

The light-scattering measurements were made at om temperature (~ 18° C.) using the wave-lengths 5461 A. and 4359 A. The results for each specimen agreed within the limits of experimental error, and those given in Table 1 are the mean values so obtained. Concentrations were determined from the phosphorus content using Allen's colorimetric method[8]. Wyatt's value of 9·4 per cent phosphorus for calf thymus deoxyribonucleic acid[10] was assumed throughout, and the values for the molecular weights are therefore subject to small corrections. The values of the refractive index increment, 0·175 at 5461 A. and 0·181 at 4359 A., were measured for calf thymus deoxyribonucleic acid and were used for all specimens. The latter figure agrees to within a few per cent with the most recent value given by Reichmann *et al.*[1]; we note also that our values for the macromolecular parameters of the calf thymus deoxyribonucleic acid are in excellent agreement with those given by these authors.

We are not aware of any previous measurements of the molecular weight of the *Arbacia lixula* or avian tubercle deoxyribonucleic acid; since these have yielded the extreme values for the molecular weight, Zimm plots for these specimens are given in Figs. 1 and 2. With the exception of the second specimen of the avian tubercle deoxyribonucleic acid, all measurements were made on solutions prepared from fibres which were placed in the solvent three days prior to the final centrifugation. For these systems the reciprocal particle-scattering factors were found to be almost linear over the angular range 25°–135°, thus indicating a system of polydisperse Gaussian coils having a weight-to-number average molecular weight ratio of 2. In order to ensure that the high molecular weight found for the avian tubercle deoxyribonucleic acid was not due to insufficient time having been allowed for the fibres to pass into solution, a second specimen was prepared using fibres which had been kept in the solvent for eight days before the final centrifugation. The molecular weight was found to be essentially the same, although the particle shape was significantly changed. A decrease in the particle radius of gyration, together with a pronounced upward curvature of the reciprocal

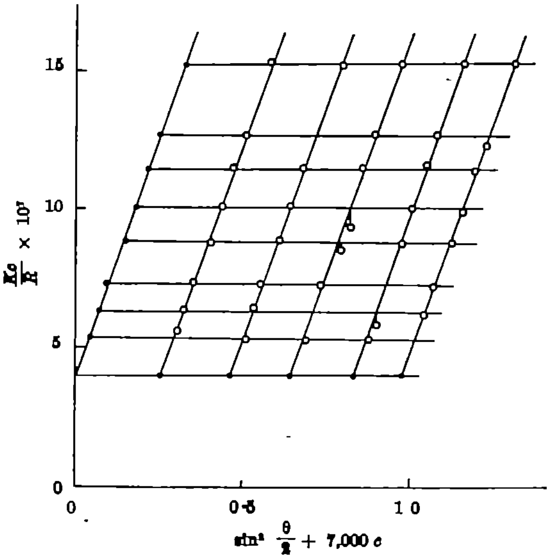

Fig. 1. Zimm plot for *Arbacia lixula* deoxyribonucleic acid in 0·2 *M* sodium chloride, *p*H 6·8. Angular range 25°–70°. Concentrations: 3·08, 6·04, 9·22, 11·9 and 14·0 × $10^{-6}$ gm./ml. $\lambda$ = 5461 A.

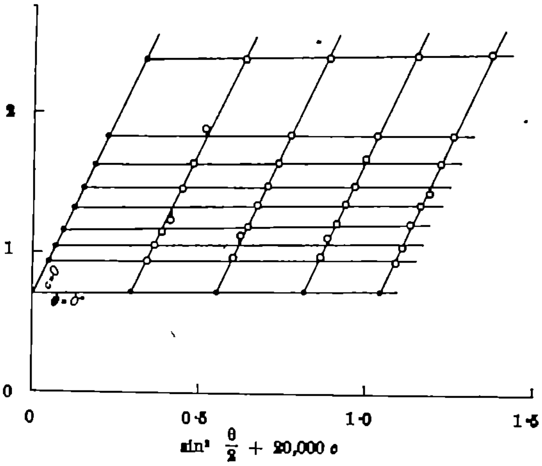

Fig. 2. Zimm plot for avian tubercle deoxyribonucleic acid in 0·2 *M* sodium chloride, pH 6·8. Angular range 25°–70°. Concentrations: 1·46, 2·75, 4·06 and 5·20 × $10^{-5}$ gm./ml. λ = 5461 A.

particle-scattering factor, indicated a more highly coiled unit.

Of the four specimens investigated, the avian tubercle deoxyribonucleic acid molecule is characterized by the fact that its increased weight is not accompanied by a corresponding increase in the radius of gyration; this suggests that the mass per unit length along the chain may be greater for this molecule. Further, its ability to take up a more coiled configuration in solution may be due to intramolecular forces between different parts of the same chain. These findings suggest that, as the guanine content increases, the chains are more strongly bonded by forces which determine both the macromolecular weight and configuration in solution. It is significant that in the twin helical, hydrogen-bonded, structure, proposed for the deoxyribonucleic acid molecule by Watson and Crick[11], the 2-amino group of the guanine base appears to be available for the binding of two chains or for the binding of different parts of the same chain.

We are indebted to Dr. A. V. Patterson, of the Ministry of Agriculture, Weybridge, for the supply of avian tubercle bacilli used in this work.

## Dissociation of Deoxyribonucleic Acid by Urea

WE found[1] that the molecular weight of deox
ribonucleic acid from herring sperm heads, measur
by light-scattering in dilute aqueous solution, w
reduced from 6 × $10^6$ to 3 × $10^6$ on adding a co
centrated urea solution to make the final ur
concentration 4 *M*. This halving of the molecul
weight was accompanied by a 20 per cent increa
in the radius of gyration of the coil. This behavio
is consistent with the twin spiral model of Crick a
Watson[2] if it is assumed that the urea splits t
hydrogen bonds holding the two molecules togethe
After removal of the urea by dialysis the 'spl
molecule coils up into a much more compact shape
if the dialysis is conducted from solutions co
taining less than 0·003 per cent deoxyribonucle
acid, the molecular weight remains unchanged
3 × $10^6$; in more concentrated solutions aggregati
occurs and molecular weights ranging up to 2 × 1
have been measured.

Doty and Rice[3] attempted to repeat these exper
ments with deoxyribonucleic acid from thym
glands but found that in this case urea does n
change the molecular weight. To determine wheth
this failure of thymus deoxyribonucleic acid t
dissociate was due to slight differences in techniq
or to an inherent difference between the deoxyrib
nucleic acid from herring sperm and thymus w
exchanged samples with Prof. P. Doty and confirme
his finding. Since then we have examined sever
samples of deoxyribonucleic acid prepared by Pro
J. A. V. Butler and Dr. P. F. Davison by the enzym
method described by Butler *et al.*[4] and have aga
found that material from herring sperm was split b
urea whereas that from the thymus gland was no
It seems clear, therefore, that the deoxyribonucle
acids from the two sources, although originally
similar molecular weight, show genuine differenc
in behaviour.

A further physico-chemical difference betwe
these two types of deoxyribonucleic acid was foun
in their response to heating for 15 min. in 0·05 pe
cent aqueous solution to 100° C. In agreement wit
Doty and Rice[3], we find the molecular weight
thymus deoxyribonucleic acid is unchanged, but tha
the size of the molecule is decreased. The molecula
weight of the material from herring sperm, howeve
is reduced in molecular weight to 2·5 × $10^6$ if heate
in 0·1 *M* sodium chloride.

Since Jungner[5] had reported that thymus deoxy
ribonucleic acid contained 0·1 per cent magnesium
we decided to test if chelation by metal ions migh
be responsible for the failure of urea to 'split' it
Preliminary evidence supporting this view wa
obtained; thymus deoxyribonucleic acid, after treat
ment with the sequestering agent ethylene diamin
tetracetate and its removal by dialysis, was u
changed in molecular weight but was now 'spli
by urea to give units of molecular weight of 3 × 10
The dissociation of this material required 30 mi
after the addition of the urea, whereas the splittin
of herring sperm deoxyribonucleic acid is complet
within ten to fifteen minutes.

## Extraction of Collagen from Tissues

In the course of some estimations of deoxyribo- cleic acid by Schneider's method[1], we observed cidentally that the hot trichloroacetic acid ex- action of the tissue removed the collagen almost mpletely, judged by estimations of hydroxyproline n the hydrolysates of the solubilized and insoluble aterial.

We have now examined this method of solubilizing llagen in other tissues with the view of using it stead of the normal autoclaving procedure in con- nction with the method of Neuman and Logan[2] r estimation of collagen from the hydroxyproline ntent of an acid hydrolysate of the solubilized aterial. In order to estimate the completeness of e extractions, we estimated the hydroxyproline ontent of the extracts and of the residual insoluble aterial. On the basis of a preliminary investigation long these lines using various times of extraction, e decided on two half-hour extractions with 0·3 *M* richloroacetic acid at about 90° C. followed by two ashes with cold trichloroacetic acid. Elastin of dog's orta does not appear to be dissolved by this pro- edure, though it is rendered soluble in *N*/10 sodium ydroxide, so that the usual method of estimating ; after collagen is not applicable[4,5]. Some results ith the method are given in Table 1.

Table 1

| | Collagen (gm. per 100 gm. wet weight) | Collagen extracted (per cent) |
|---|---|---|
| Rat muscle | 0·77 | 97·4 |
| Rat skin (with hair) | 4·52 | 98·3 |
| Rat tail tendon | 15·70 | 100·1 |
| Rat mammary gland (lactating) | 1·47 | 98·0 |
| Rat liver | 0·18 | 96·4 |
| Ox liver (*a*) pulp | 0·25 | 92·8 |
| (*b*) vessels | 5·1 | 97·5 |

(*a*) Material pressed through 1 mm. diameter holes in a metal plate.
(*b*) Material retained by perforated metal plate.

The completeness of extraction tends to drop lightly as the collagen content of the material liminishes, possibly owing to increased relative mportance of adsorption of gelatin on precipitated roteins. The liver pulp, which gave the lowest xtraction, probably contains a large proportion of eticulin which is known to be difficult to solubilize, difficulty which occurs also with other methods of xtraction. This degree of extraction would in any vent be quite adequate for many purposes.

The method is quicker and simpler than the usual rocedure[3]; it also has great advantages for sampling a large bulk of tissue which is difficult to homogenize. The tissue is roughly broken up and subjected to the first period of heating with trichloroacetic acid. It can then be homogenized very easily in a blender and sampled; tissue containing bone can be dealt with easily in this way.

We are grateful to the Nuffield Foundation for a grant for this work.

## Inhibition of Histamine Release in Anaphylaxis

ALTHOUGH the effects of anaphylaxis and chemical histamine releasers are similar and mainly attributable to histamine release, the mechanism by which the release occurs in the two cases is fundamentally different. We have found that lack of oxygen and also inhibitors of oxidative and glycolytic metabolism have a powerful inhibitory action on the release of histamine in anaphylaxis but enhance its release by compound 48/80 (a condensation product of *p*-methoxyphenyl-ethyl-methylamine and formaldehyde) and octylamine.

By the use of minced guinea pig lung from animals sensitized to egg albumin, it is possible to release with the specific antigen 20–40 per cent of the total histamine contained in the tissue. Addition of 1 m*M* iodoacetate reduces this release to 5 per cent or less. Suitable concentrations of compound 48/80 (1 mgm./ml.) and octylamine (0·15 mgm./ml.) also release 20–40 per cent of the histamine content of the tissue; but in the presence of 1 m*M* iodoacetate this release is nearly doubled. Addition of the antigen in the presence of nitrogen produces similar effects, namely, an almost complete inhibition of the anaphylactic release and a potentiation of histamine release by the chemical releasers. It has previously been shown by Parrot[1] that anoxia inhibits the release of histamine in anaphylaxis. The effect of anoxia could be partially reversed by methylene blue; but that of iodoacetate was not reversed by pyruvate.

These results suggest that the release of histamine in anaphylaxis is a process which requires energy and can easily be disrupted. The action of chemical releasers, on the other hand, is enhanced by processes which interfere with normal cell metabolism. These findings may possibly explain why isolated intracellular particles containing histamine are able to release histamine when treated with chemical releasers[2], but cannot be made to release histamine in anaphylaxis[3].

## Effect of Antibiotics on Indole Synthesis by *Escherichia coli* 7-4

It has been shown (Gibson, Jones and Teltscher[1]) that indole is formed from glucose and ammonium chloride by washed-cell suspensions of a mutant, *Escherichia coli* 7-4, blocked in the conversion of indole to tryptophan. The effect of some antibiotics on the formation of indole has now been studied.

It was found that chloramphenicol, terramycin, aureomycin and streptomycin inhibited indole formation, but penicillin had little effect (Table 1). The minimum concentrations of chloramphenicol, terramycin and aureomycin needed to inhibit indole synthesis corresponded closely to the bacteriostatic concentrations for *E. coli* 7-4 in the liquid synthetic medium described by Davis and Mingioli[2]. As an example of such inhibition, the effect of terramycin on total growth and indole synthesis is shown in Fig. 1.

Table 1. EFFECT OF ANTIBIOTICS ON INDOLE SYNTHESIS BY *E. coli* 7

| Addition to indole synthesis system* | Indole formed (mμM./mgm. dry wt. cells) |
|---|---|
| None | 260 |
| Terramycin (1 μgm./ml.) | 41 |
| Aureomycin (1 μgm./ml.) | 71 |
| Chloramphenicol (5 μgm./ml.) | 44 |
| Streptomycin (10 μgm./ml.) | 231 |
| (150 μgm./ml.) | 35 |
| Penicillin (100 units/ml.) | 274 |
| (1,000 units/ml.) | 196 |

* Indole synthesis system. Washed cells from heart infusion ag (0·8 mgm./ml. dry wt.); glucose (0·1 *M*); DL-serine (0·01 *M*) ammonium chloride (0·005 *M*); phosphate buffer (0·1 *M*, pH 7·7 Test incubated 5 hr. at 37°.

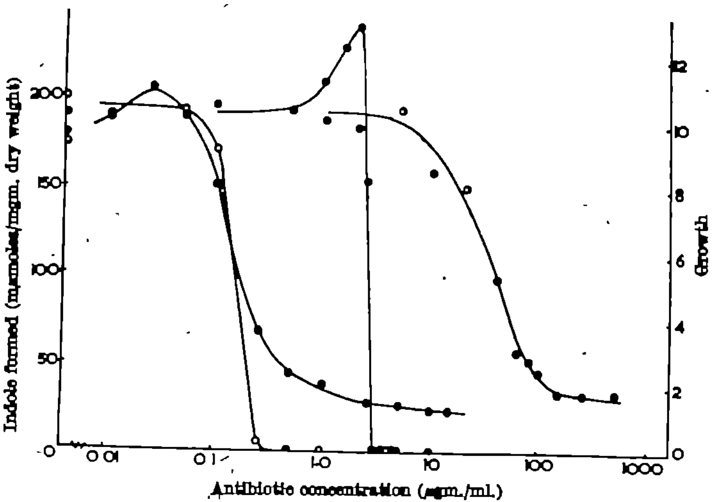

Fig. 1. Effect of terramycin and streptomycin on growth and indole synthesis by *E. coli* 7-4.
—○—○—, Terramycin, growth (expressed as turbidity with *E.E.L.* portable colorimeter); —●—●— terramycin, indole synthesis; —◒—◒—, streptomycin, growth (expressed as turbidity with *E.E.L.* portable colorimeter); —◑—◑—, streptomycin, indole synthesis.
Indole synthesis. Substrates and cells as in Table 1. Antibiotics added with substrates and test incubated 4 hr. at 37°.
Bacteriostatic tests. Davis minimal medium plus DL-tryptophan ($10^{-4}$ *M*) incubated 24 hr. at 37°

Chloramphenicol, terramycin and aureomycin have been shown to suppress the formation of adaptive enzymes in *E. coli*[3]; but their interference with indole synthesis is different since the addition of any of these drugs to adapted cells still inhibited synthesis (Fig. 2). Thus the action of these antibiotics on the formation of adaptive enzymes may be secondary to the inhibition of the synthesis of essential aromatic compounds.

Streptomycin differed from the other antibiotics tested in that it did not inhibit indole synthesis at the concentration needed to prevent growth (8 μgm./ml.), but was effective at higher concentrations (Table 1, Fig. 1). Furthermore, the addition of streptomycin (150 μgm./ml.), once indole formation was proceeding at maximum rate, did not interfere with its synthesis (Fig. 2). It appears that streptomycin inhibits some adaptive process concerned in the formation of indole.

Various workers have suggested that antibiotics may interfere with protein synthesis or with the biosynthesis of the aromatic amino-acids (see ref. 4). That chloramphenicol, terramycin and aureomycin may interfere with the same metabolic pathway is suggested by the finding that strains of *E. coli* made resistant to any one of the three drugs showed a cross-resistance to the other two[5].

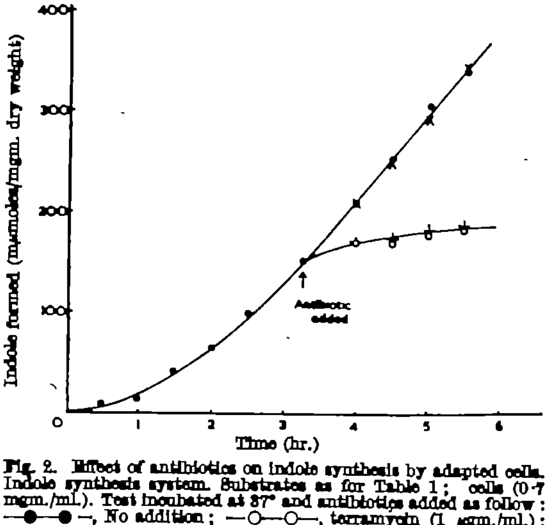

Fig. 2. Effect of antibiotics on indole synthesis by adapted cells. Indole synthesis system. Substrates as for Table 1; cells (0·7 mgm./ml.). Test incubated at 37° and antibiotics added as follow: —●—●—, No addition; —○—○—, terramycin (1 μgm./ml.); —+—+—, chloramphenicol (5 μgm./ml.); —×—×—, streptomycin (150 μgm./ml.)

The present results provide evidence that some antibiotics, at bacteriostatic concentrations, inhibit reactions associated with aromatic synthesis in *E. coli*.

# Protective Action of Vitamin $B_{12}$ in the Hyperthyroid Rat

Since thyroxine is known to decrease the efficiency th which phosphorylation is coupled to respiration[1], e possibility suggests itself that vitamin $B_{12}$ may *action in* hyperthyroidism by restoration, in part least, of the energy-requiring functions of impaired lls. This has now been examined by a study of the llowing conjugation systems: acetylation of *p*-minobenzoic acid, benzoylation of glycine, and nthesis of glutathione.

Groups of six rats (Wistar strain), 120–140 gm. weight, were maintained on the following laboratory ook diet:

| | | | |
|---|---|---|---|
| hole wheat flour | 69 parts | Shark liver oil | 4 parts, |
| sein | 10 " | Sesame oil | 4 " |
| hole milk powder | 2 " | Calcium carbonate | 2 " |
| ded fish meal | 3 " | Sodium chloride | 2 " |
| heat bran | 4 " | | |

ith modifications as shown (Table 1). Iodinated casein Protomone': Cerophyl Laboratories, Kansas City, Io.) was at 3 per cent level and replaced an equal mount of casein in the diet. Vitamin $B_{12}$ ('Cobionne': Ierck) was administered intraperitoneally at 10 γ per at per day. The animals receiving iodinated casein group 3) in the diet lost 7–10 per cent body-weight uring two to three weeks when they were considered yperthyroid[1]. Acetylating ability was determined uring this period by the method of Bratton and Iarshall[2] after intraperitoneal administration of -aminobenzoic acid (1 mgm./300 gm. body-weight) ollowed by urine collection for the next 24 hr. A mall amount of the *p*-aminobenzoic acid was apparntly excreted as *p*-aminobenzoyl glycine, which was letermined separately in aliquots of the urine[2]. orrections were made in either case for endogenous xcretions.

Blood samples were collected from the tail veins or determinations of erythrocyte glutathione after aemolysis, plasma being nearly devoid of this netabolite.

At the end of three weeks, the animals were killed; ivers and adrenals were quickly excised and chilled or immediate determinations of glutathione[4] and for he *in vitro* synthesis of benzoyl glycine by the liver nzymes. For the latter purpose, the procedure mployed was as follows: 0·5 c.c. of 1:5 liver homogenate in 0·1 *M* phosphate buffer, *p*H 7·5, was added o a mixture of glycine (0·01 *M*), benzoic acid 0·0025 *M*), potassium dihydrogen phosphate (0·037 *M*), magnesium sulphate (0·0008 *M*), sodium citrate 0·01 *M*) and sodium fumarate (0·0015 *M*) in the oncentrations indicated in a final volume of 5 c.c., *p*H being adjusted to 7·5 with dilute potassium hydroxide. All flasks were gassed with oxygen for 10 min. prior to incubation for 3 hr. at 37° with frequent shaking. Reaction was stopped by addition of 0·2 c.c. of *N* sulphuric acid and the benzoyl glycine formed estimated[3]. Values reported in Table 1 represent increments after the incubation period over corresponding zero-time digests prepared similarly.

The results, which are averages for the six animals in each group, show that in the hyperthyroid animals there is a marked reduction in acetylating ability as well as in tissue glutathione as compared to the control group. Vitamin $B_{12}$ supplementation counteracts this condition appreciably.

An observation of interest emerging from this study is the increase in blood glutathione during thyrotoxicosis and its reversal by vitamin $B_{12}$. This inverse relationship between blood- and liver-levels of glutathione has since been confirmed in other studies now under progress, and is also suggested from the report[5] that there is an increase in erythrocyte glutathione in methionine deficiency.

Iodinated casein has been reported to interfere with vitamin $B_{12}$ absorption[6]. Since vitamin $B_{12}$ is involved in the activation of soluble and protein sulphydryl, its role in carbohydrate and lipid metabolism has been demonstrated[7]; it is also involved in the synthesis of porphyrins and respiratory pigments[8]. It seems, therefore, that the primary manifestation of thyrotoxicosis is a deficiency of vitamin $B_{12}$, and consequent interference in the generation and utilization of energy-rich bonds coupled with electron transport.

Table 1

| Group | Per cent gain in weight (during 3 weeks) | Glutathione in: Liver (mgm./gm., fresh basis) | Glutathione in: Adrenals (mgm./gm., fresh basis) | Blood (mgm./100 c.c.) | Synthesis *in vitro* of benzoyl glycine (mgm./gm. dry liver) | Per cent urinary conversion of *p*-aminobenzoic acid to: *p*-aminobenzoyl glycine | Per cent urinary conversion of *p*-aminobenzoic acid to: N-acetyl *p*-aminobenzoic acid |

## Essential Relaxing Factor in Muscle other than Myokinase and Creatine Phosphokinase

EXTRACTS of rabbit skeletal muscle contain factors which play a part in the relaxation of muscle fibre models, such as glycerinated fibres[1–3]. Two of them isolated have been identified with known enzymes: myokinase by Bendall[4] and creatine phosphokinase by Lorand[5]. But these two enzymes, coupled with their co-factors, do not settle all the problems of muscular relaxation because, in the light of our experiments, they do not have any relaxing effect on glycerinated fibres which have been preserved for a long time and exhaustively washed (Fig. 2*a*).

We have shown[6] that the adenosine triphosphate-dependent relaxing factor, in fact, consists of two different components; one occurs in the fraction precipitated by ammonium sulphate at concentrations of 10–20 gm. of sulphate per 100 ml. of extracted solution from muscle, tentatively named 'fraction *A*', and the other in the fraction precipitated by concentrations of 30–40 gm. of sulphate per 100 ml. of extracted solution from muscle, 'fraction *B*'. Each has a moderate relaxing effect on relatively fresh fibres. If the fibres to be tested, however, have been preserved in 50 per cent aqueous glycerol for one month or more at – 10° C. and washed in 0·1 *M* potassium chloride solution for several hours, each fraction by itself no longer has a relaxing effect (Fig. 1, *a* and *b*). The relaxing activity is not recovered until these two fractions are used together (Fig. 1*c*).

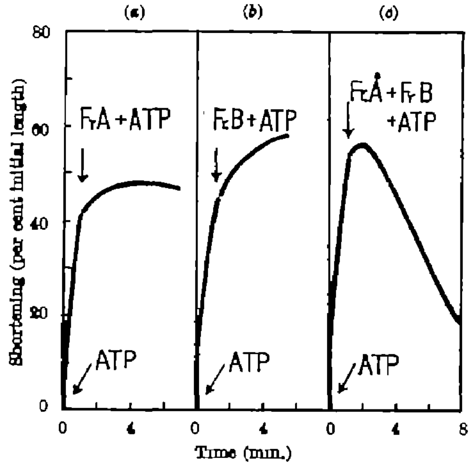

Fig. 1. Effect of fraction *A* and *B* on a muscle fibre shortened in adenosine triphosphate.

ATP = 5 m*M* adenosine triphosphate; Fr. *A* + ATP = 2·2 mgm./ml. of fraction *A* + 5 m*M* adenosine triphosphate; Fr. *B* + ATP = 17 mgm./ml. of fraction *B* + 5 m*M* adenosine triphosphate; Fr. *A* + Fr. *B* + ATP = 2·2 mgm./ml. of fraction *A* + 15 mgm./ml. of fraction *B* + 5 m*M* adenosine triphosphate. All the experiments were performed in 0·16 *M* potassium chloride containing 0·01 *M* magnesium chloride. For fractions *A* and *B*, see text

Fraction *A* is highly opalescent, suggesting that it contains a considerable amount of lipid. It has strong adenosine triphosphatase activity, which corresponds apparently to Kielley–Meyerhof's adenosine triphosphatase[7]. No method has so far been found for separating the active relaxing principle from the enzyme. These two substances are quite similar in properties in certain respects: both can be centrifuged at 18,000 *g* for 1 hr. without losing their activity; both are activated by magnesium ions, the optimum of which is about 0·004 *M*, ar inactivated specifically by a small amount of calciu ions. Their identity, however, remains to be prove and requires further study.

Fraction *B* contains myokinase and creatin phosphokinase. It is probable that myokinase pla an important part in the adenosine triphosphat dependent relaxing action of fraction *B*. Indee crude myokinase, if combined with fraction *A*, h a lengthening effect on moderately washed fibr (Fig. 2*b*). Nevertheless, the whole activity of fractio *B* cannot be ascribed to myokinase, for this fractio is far more labile to acid than myokinase, and the case of old and washed fibres, myokinase is n effective, even when combined with fraction (Fig. 2*c*). Some other factor or factors in fraction evidently participate in relaxation (Fig. 2*d*).

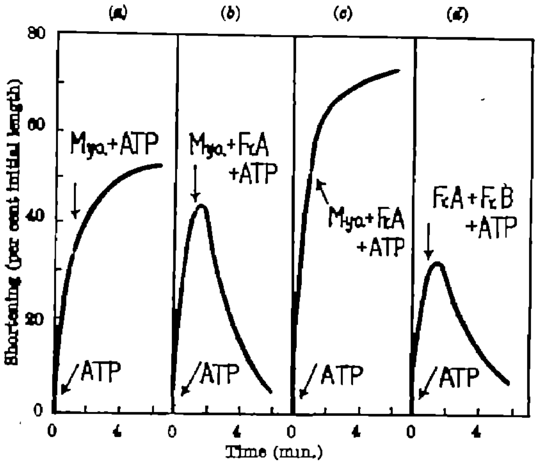

Fig. 2. Effect of crude myokinase and fraction *B* combined or uncombined with fraction *A* on a muscle fibre shortened in adenosine triphosphate.

Myo. + ATP = 0·4 mgm./ml. of crude myokinase (acidified and fractionated by ammonium sulphate) + 5 m*M* adenosine triphosphate; Myo. + Fr. *A* + ATP = 0·16 mgm./ml. of crude myokinase + 5 mgm./ml. of fraction *A* + 5 m*M* adenosine triphosphate; Fr. *A* + Fr. *B* + ATP = 5 mgm./ml. of fraction *A* + 8 mgm./ml of fraction *B* + 5 m*M* adenosine triphosphate. In (*a*) and (*b*) relatively unwashed muscle fibres were used; (*c*) and (*d*) fibres preserved and washed. Other notes as in Fig 1

Unless it is aided by fraction *A*, the creatine phos phokinase–phosphocreatine–adenosine triphosphat system[2,5] also has no effect on old and washed fibre

As described above, fraction *A* is essential for th relaxation of muscle fibre models. Experiments b other workers[1,2,4,5] have probably been conducte on fibre preparations which still contain some of th active principle of this fraction.

Details of this work will be published elsewhere.

## Maturation Divisions of the Ova in the Pseudophyllidean Cestode, *Eubothrium crassum* (Bloch)

Much confusion still exists in generalized accounts life-histories of parasitic platyhelminthes concern-g the position of the egg at the time of its maturation visions and therefore about the exact time of rtilization. Indeed, it has been suggested[1] that ormal gametogenesis does not occur in many cestodes the Cyclophyllidea, Tetraphyllidea and Trypano-ynchs. In a number of digenetic trematodes, on e other hand, it has been carefully shown by various orkers, notably Chen[2], Rees[3], Stephenson[4] and illmott[5], that meiosis in the ovum is normal and occurs in that part of the uterus immediately beyond e central chamber of Mehlis's gland. The ova ove into the uterus at this point surrounded by olk cells and begin maturation divisions at once hile the shell is being laid down around the egg omplex, which comprises one ovum, yolk cells and ermatozoa.

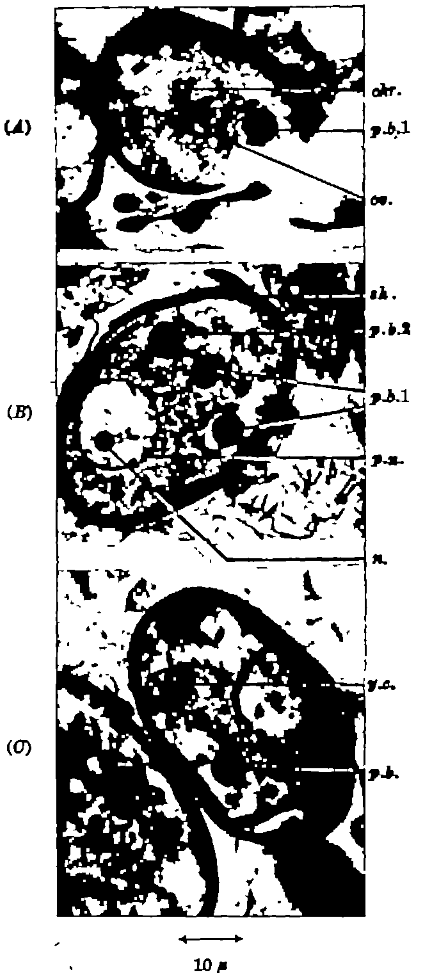

Fig. 1. Egg complex in uterine duct. Material fixed in Bouin's fluid at 70° C., sectioned at 6 µ and stained with Heidenhain's iron hæmatoxylin. *A*, first polar body and chromosomes at second maturation division metaphase; *B*, female pronucleus with well-defined nucleolus, second polar body, and first polar body divided; *C*, differentiation of yolk cells and polar body. *chr.*, Chromosomes; *n*, nucleolus; *ov.*, eccentrically placed female cell; *p.b.1*, first polar body; *p.b.2*, second polar body; *p.n.*, female pronucleus; *sh.*, shell; *y.c.*, yolk cell

Normal maturation divisions of ova have been reported in a few cestodes, both primitive and advanced, by much earlier authors, some of whom found polar bodies in association with the ovum. Young[1], however, after working on some of the more advanced cestodes mentioned above, considered that these workers had confused the polar bodies and yolk cells. The only work published since then on this aspect of cestode cytology is that of Motomura[6]. He gives convincing evidence of normal oogenesis in the monozoic cestode, *Archigetes appendiculatus*, and shows in a series of figures how the whole process of maturation, fertilization and shell formation is very similar to the condition described in the various trematodes and occurs in an analogous position, that is, immediately beyond the central chamber of Mehlis's gland. But until now there have been no photographs of the egg complex in any cestode.

I find that my results on *Eubothrium crassum*[7] agree very closely with those of Motomura, so that the same general scheme is demonstrated once again, this time in a pseudophyllidean cestode. In this and in more advanced cestodes, however, a definite uterine duct exists between the oviduct and Mehlis's gland, and it is this which is usually referred to as the 'fertilization canal' or 'befruchtungsgang'. Invariably, in my sections, this part of the uterine duct was empty and surrounded by slime gland cells, both features suggesting that this is a duct through which the contents pass quickly, while the uterine duct beyond Mehlis's gland harbours the egg complex for some time. In addition, the accompanying photographs show the chromosomes of the ovum in this position at the second maturation division with the first polar body undivided (Fig. 1,*A*), and also the pronucleus stage with its large nucleolus and second polar body (Fig. 1,*B*). At this pronucleus stage the first polar body is seen to be divided—a feature not observed by Motomura. Fig. 1,*C* shows how the polar bodies are easily distinguished from yolk cells.

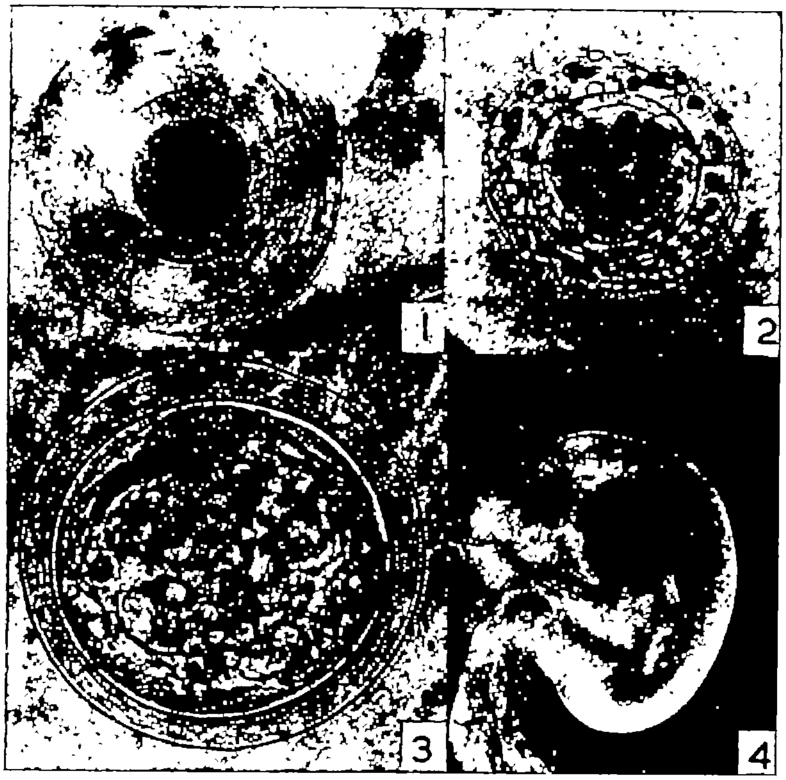
## Transfer of Mammalian Ova between Species

The intra-specific transfer of mammalian eggs has now been developed into a well-established technique[1]; but apart from two recent communications[2,3], relatively little information is available concerning either inter-generic or inter-specific transfer. The absence of any reliable method for the culture of sheep eggs *in vitro* led us to investigate whether they could develop normally following transfer to the genital tract of the rabbit. The reproductive pattern of the rabbit makes it eminently suitable for a study of this nature.

Sheep eggs were obtained from the Fallopian tubes of ewes treated with pregnant mare serum and mated



2½–3 days prior to the operation. The technique employed for the recovery of the eggs was the same as that previously described[4]; sterile sheep serum was used as the flushing and transfer medium in all experiments. Pending transfer, the eggs were stored at 10°–16° C. for 20–45 min. To date, eighteen eggs, comprising four 2-cell, four 4-cell, four 6-cell, five 8-cell and one 12-cell, have been transferred to the Fallopian tubes of seven does which had been mated with a vasectomized buck 2–114 hr. previously. Four to five days later the rabbits were killed and the eggs recovered from the uterus (four cases) or the Fallopian tubes (one case); in the remaining two does, none of the five eggs transferred was recovered. Out of the eighteen eggs transferred, nine were afterwards recovered together with a high proportion of the rabbits' own eggs. Whereas all the rabbit eggs were found uncleaved (Fig. 1), the sheep eggs had continued to cleave normally; at recovery there were six 32-cell morulae (Fig. 2), and two 6-day blastocysts and one 8-day blastocyst (Fig. 3). Although the sheep eggs had acquired the mucin layer characteristic of the rabbit egg, no difficulty was encountered in establishing their identity owing to the inherent structural differences, and the characteristic colour and density of the ooplasm.

The two 6-day blastocysts were re-transferred to a non-pregnant ewe in which ovulation had occurred six days previously. When this animal was killed sixteen days later, two normal embryos were found (Fig. 4). One morula was also re-transferred to another recipient; but no trace of it could be found at autopsy 13½ days after transfer.

It is concluded that sheep eggs can remain viable in the genital tract of the rabbit for a period of not less than five days, and are capable of developing from the 2-cell egg to at least the 8-day blastocyst stage. The deposition of the mucin layer on the transferr sheep eggs appears not to int fere with their subsequent develo ment.

Our results strongly support t view that the species differenc which exist in the rates of cleava are inherent in the eggs[3]; th also provide some evidence agai the suggestion that the success interspecific ovum transfer is lated to the ability of the spec concerned to hybridize[5].

It is hoped to develop the eg transfer technique outlined abo as a means of testing the viabili of sheep eggs in the early stag of development. Moreover, t use of the reproductive tract the rabbit as an 'incubator' m enable the successful long-distan transport of sheep eggs.

These experiments form part the investigations on ovum phys logy being carried out at t Agricultural Research Council Ur of Reproductive Physiology a Biochemistry; we are grateful Dr. T. R. R. Mann for reading a discussing the manuscript. O of us (R. L. W. A.) is in receipt a bursary from the New Zeala Wool Board.

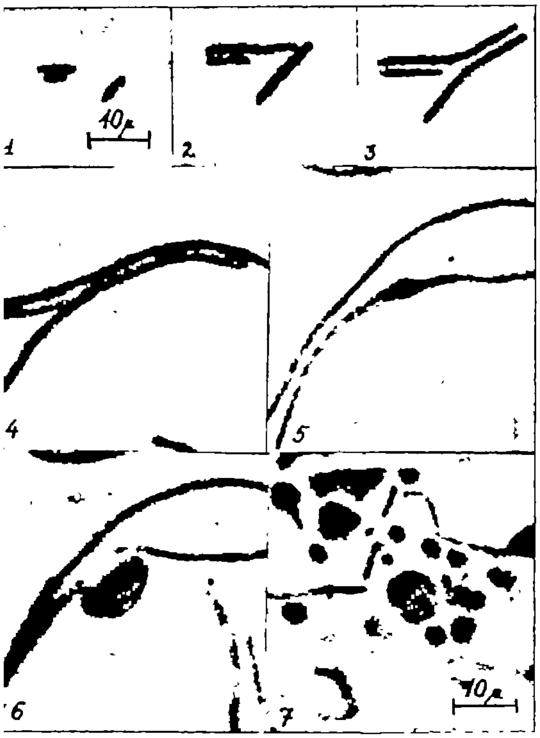
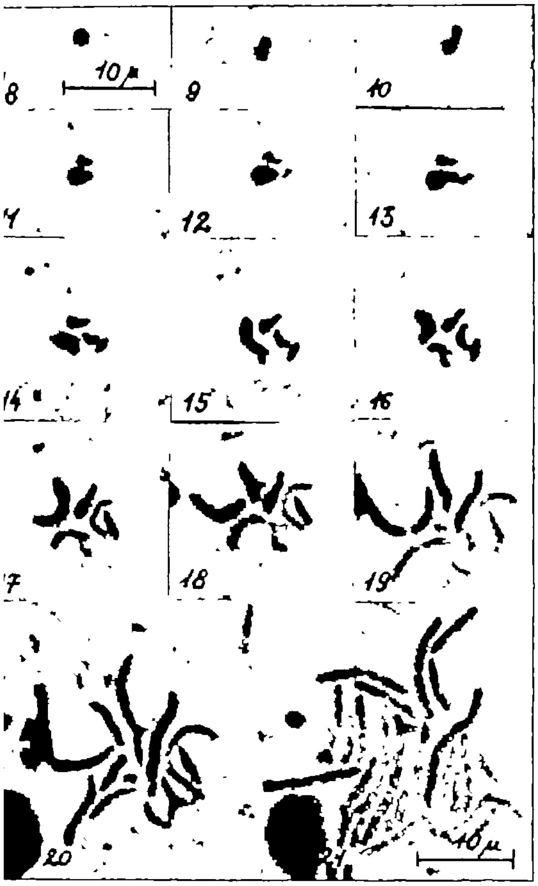
## Plasma Globules of *Salmonella enteritidis* arising under the Influence of Penicillin and their Reversion to the Original Bacillary Forms

CHANGES in the behaviour of *Salmonella enteritid* var. *danysz* have been studied by the agar bloc method and recorded microcinematographically.

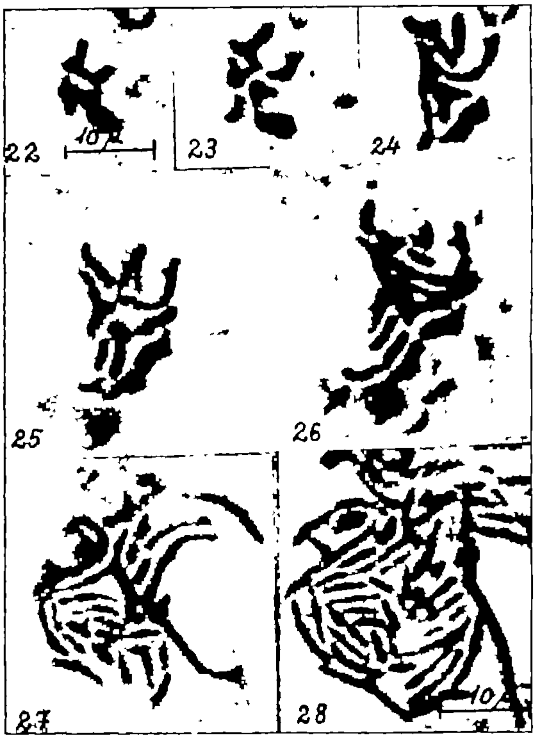
Under the influence of 30–40 I.U. of penicilli the bacteria increase in length (Figs. 1–4). Thes elongated bacteria develop a spindle-like swelling a the middle of the body (Fig. 5), which bursts afte some time, discharging its contents (Fig. 6). This followed by the disruption of the elongated fila mentous forms, some parts of which become swolle and liquid. At this time the pulsating liquid materia from burst spindles and disintegrated filaments sub divides into minor globules (Fig. 7).



igs. 1–7. Plasma globules arising on exposure to penicillin. 3-hr. process. Photomicrographs enlarged from selected single exposures from the film)



igs. 8–21. Development of bacterial microcolony from a single plasma globule in three hours (cinematographic appearance)



Figs. 22–28. Reversion through intermediate forms which arose from plasma globule in two hours (recorded cinematomicrographically)

The forms arising in the course of exposure to penicillin were gently washed with serum broth on the coverslips and transferred to penicillin-free blocks to be studied for regeneration. The following observations were made.

The remains of the rods did not regenerate, but the smaller protoplasmic globules developed, as shown in the photomicrographs 8–21 and 22–28, through an intermediate stage of irregular forms, into typical or atypical forms. The fragments thus originating from one and the same globule apparently differ in their significance.

The full report of this work is to be published in *Acta Biologica Hungarica*.

## Origin of Man

Orowan[1] suggests that the high uric acid concentration in the blood of human beings and anthropoids, as compared with other mammals, may be a cause of their intellectual development. He holds that uric acid has the same stimulatory effect on the brain as caffeine and theobromine.

This hypothesis can be tested. Normal human plasma contains about 40 mgm./litre of uric acid. Since the methylpurines are stimulants, the effect of uric acid cannot well be maximal. The condition of hyperuricaemia, in which the plasma uric acid is raised to about 80 mgm./litre on an average, is genetically determined, and sometimes gives rise to gout. It seems to be present in nearly 1 per cent of adult Americans.

If Orowan's hypothesis is correct, two conclusions follow. Hyperuricaemics are on an average more intelligent, or at least less susceptible to some kinds of fatigue, than others; and a given dose of methylpurine has less effect on them. It is a good rule not to accept a hypothesis until such tests of its validity as can readily be made have given results confirming it. I think, therefore, that until hyperuricaemics have been studied in this way, Orowan's hypothesis should be regarded as provisional. If, on the other hand, hyperuricaemics are found to differ significantly from the rest of us in their mental processes, it will probably be accepted as an important contribution to the theory of evolution.

## The First Australopithecine Fragment from the Makapansgat Pebble Culture Stratum

DURING October 1954, Mr. C. K. Brain[1] discovered 129 trimmed, utilized or damaged stones *in situ* in the 18-ft. red, gravel-bearing, sandy layer 25 ft. above the australopithecine-carrying grey breccia at the Makapansgat Limeworks site. Of these, seventeen were claimed by Prof. C. van Riet Lowe to be undoubted Developed Kafuan artefacts, fifteen being of deeply leached dolomite, one of vein quartz and one of dark grey quartzite.

The generous financial assistance afforded to Prof. van Riet Lowe and to me by the Wenner-Gren Foundation for our separate programmes in Makapansgat Valley has enabled us to pursue a joint programme at the Limeworks site this year. Sorting of the dump was resumed in March by Mr. Alun R. Hughes, and in the following month he was joined by Mr. Revill Mason, assistant archæologist in the Union Archæological Survey, to initiate a systematic excavation of the Limeworks Cone, an immense conical block with a basal diameter of approximately 150 ft., the collapse of which subsequent to the earlier mining operations had exposed in the cavern overhang the stratification reported by Brain (*loc. cit.*). Père E. L. Boné, of the University of Louvain, and Mlle. Suzanne Jean, of the Musée de l'Homme, Paris, also assisted in the work during April.

These field-operations have resulted in the recovery of several thousands of pebbles, the artefact content of which will doubtless form the subject of further archæological communications. The purpose of this interim communication is to announce the recovery from the pebble bed of several fossil fragmen including a single elephantine enamel plate, fo small pieces of a long bone of some large mamm such as elephant or rhinoceros and, most importar a small right australopithecine maxillary fragme found on April 30 by Mr. Alun R. Hughes. On 4 cm. × 2·5 cm. × 1·5 cm. in size, it neverthele comprises two considerably damaged (first and secon molars and the tip of the buccal second premolar ro

These teeth are so grossly damaged that, of t occlusal surface, only about two-thirds of the fi and about one-third of the second molar are preserve and the disto-buccal root of the second molar only represented by its impression: hence both pu cavities are widely exposed. The remains of t occlusal surfaces have also suffered attrition almc to their roots; so it is impossible to assess the natu of their cusp pattern even to the limited extent th could be diagnosed in the second adult palate *Australopithecus prometheus*[2] of still more advanc age previously extracted from the grey breccia itse

That *A. prometheus* specimen from the grey brecc however, displaying comparable and even mo advanced attrition, having a rather similar ro exposure and coming from the same Limeworks s though from a lower and different stratum, h afforded an indispensable means of comparing tl mutilated, but none the less identifiable, maxilla fraction (see Figs. 1 and 2).

The probable crown dimensions (*M*1, 14·0 × 14· *M*2, 14·25 × 15·0) of these mangled molars co pare reasonably well with those found for t corresponding teeth in the second (? fema promethean palate (*M*1, 13 × 14; *M*2, 14 × 15 those in the first female promethean palate[3] we somewhat smaller (*M*1, 12·5 × 12·8; *M*2, 14 × 1 Morphologically, the only gross detectable diver ences from the *A. prometheus* teeth are that t distinct grooves on their single palatal (or lingu roots are broader and shallower on both the mola

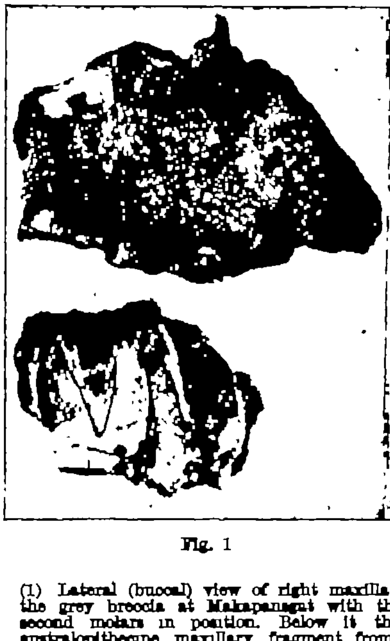

Fig. 1

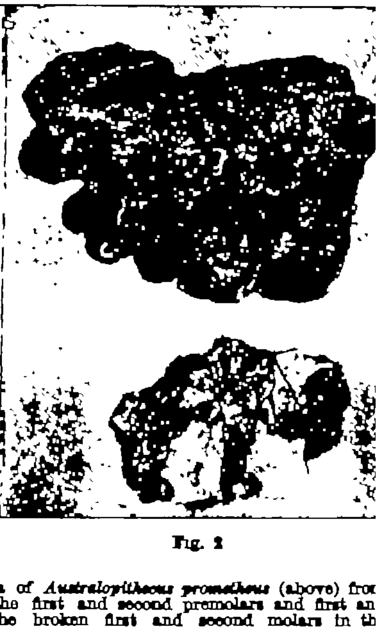

Fig. 2

(1) Lateral (buccal) view of right maxilla of *Australopithecus prometheus* (above) fro the grey breccia at Makapansgat with the first and second premolars and first an second molars in position. Below it the broken first and second molars in th australopithecine maxillary fragment from the pebble stratum in the overlying re breccia are even more distinctly visible. × 4/5

(2) The same two specimens from the medial (lingual or palatal) aspect to display th prominent grooves on the lingual roots of the first and second molars in both the australopithecine maxillæ. × 4/5

the fragment from the pebble stratum than on ose in the second specimen from the grey breccia, d that the roots of the teeth in this pebble stratum *ustralopithecus* are distinctly longer and more bust. From his extensive range of comparative stralopithecine material from Sterkfontein, Mr. T. Robinson has been able to assure me that these vergences are within the range of dental variation r *Australopithecus* (*Plesianthropus*) *transvaalensis*. outly and distinctly three-rooted molars are normal r all the Australopithecinae, as is also the presence a more or less well-defined groove on the lingual pect of the single palatal (lingual) root.

The significance of the specimen therefore rests at esent in its providing the first concrete evidence at an australopithecine type, broadly comparable ith *A. prometheus*, was contemporaneous with, and ay have been responsible for, the concomitant bble culture found in this sealed Central Transvaal vern deposit. Thereby it not only justifies the iginal nomenclature and simultaneously enhances e *hominid* status of the *Australopithecinae group*, it also demonstrates the earliest known direct sociation of such a primitive human type with that ost primitive of all known lithic cultures in southern frica.

## Genetic Control of Sodium and Potassium Concentrations in the Red Blood Cells of Sheep

RECENTLY, it has been shown that an examination f the concentrations of sodium and potassium in the ed blood cells of sheep enables two types of animal o be recognized within a breed[1]. Sodium concentration varies inversely with potassium concentration, nd determination of the latter allows the two types o be distinguished. These two types have been alled 'high potassium' (*HK*) and 'low potassium' *LK*). A large number of repeated examinations of iany sheep have been carried out, and in no case as the electrolyte type of any sheep changed from *K* to *LK* or vice versa.

The percentages of the two types within samples f the Scottish Blackface and Cheviot[1] and other reeds (Evans, J. V., and Mounib, M. S., unpublished esults) varied considerably from breed to breed. This uggested a genetic variation which has now been ivestigated.

Scottish Blackface ewes were mated with rams of hree breeds and were typed together with all available progeny. Sodium and potassium were estimated y flame photometer. Whole blood, which had been iluted 1/500 or 1/400 with distilled water, was used. he results are shown in Table 1.

*LK* rams fall into two classes: those leaving both inds of offspring (Blackface rams (vii)–(xiii)) nd those (rams (i)–(vi), the remainder) leaving othing but *LK* offspring whatever the phenotype f the ewe. *HK* rams when mated to *LK* ewes roduced both kinds of offspring, but mated to *HK* ewes only *HK* offspring. It appears that *HK* is a recessive character, and *LK* rams may be either homozygous or heterozygous for a gene affecting the electrolyte type of red blood cell. These results do not provide much information on the segregation of the gene, the most informative matings being those of heterozygous *LK* rams with *HK* ewes. Taking only sibships with at least one *HK* member, there are 9 *LK* to 8 *HK* animals. This ratio is biased due to the exclusion of sibships which by chance contained no *HK* members, although sired by a heterozygous ram; but when corrected for this bias, does not significantly differ from the expected 1 : 1.

Table 1. RED BLOOD CELL TYPE OF PROGENY FROM MATINGS OF RAMS AND EWES OF VARIOUS PHENOTYPES

In the British breeds of sheep considered here, it appears that the balance between sodium and potassium in the red blood cells can be substantially modified by a single gene difference. It would be of interest to determine the relationship to the intermediate type found by Kerr[2].

## 'Homing Instinct' in Sea Trout

LITTLE is known about the 'homing instinct' in sea trout. Lamond[1] gives several interesting examples of sea trout marked and recaptured in successive years in the same tributaries of rivers flowing into Loch Lomond, and Nall[2] has recorded similar results for sea trout in South Uist. There, two sea trout marked in small lochs were recaptured the following year in the lochs in which they had been marked, and another was recaptured after an absence of two years, again in the loch in which it had been marked. In each case the sea trout had turned into a minor stream instead of following the main stream.

While tagging sea trout in some of the spawning burns of the River Dee, Aberdeenshire, during November 1954, six tagged sea trout were recaptured in three of these burns. Each of these was recaptured in the same burn as that in which it had been tagged almost exactly twelve months previously. Two of these fish were recaptured on the same stretch of gravel as that on which they had been captured the previous year; both were half-spent females. All identifications are supported by scale examinations. No instance occurred of the recapture of a sea trout, tagged in 1953, in a different spawning burn the following year.

These observations suggest that sea trout return to their native stream and that they spawn at approximately the same time of year each year.

## Transformation of the *Lewis* Groups of Human Red Cells

In general, the blood-group antigens appear to form a permanent part of the human red cell *in vivo*; they persist throughout the life of the cell not only under normal conditions, but also after transfusion into the circulation of a recipient with a different set of antigens. Moreover, antigens characteristic of the recipient do not appear upon the transfused cells. These statements have been shown to be true for the *ABO*, *MNS*, *Rh*, *Lutheran*, *Kell*, *Duffy* and *Kidd* antigens; but the *Lewis* antigens have not previously been investigated in this respect.

The *Lewis* system was discovered by Mourant[1] in 1946: the red cell antigen $Le^a$ is the only blood-group antigen yet known which is inherited as a Mendelian recessive character[2]. The antigen $Le^b$ has so far defied precise genetic analysis, and the gene controlling it may not be allelic to that for $Le^a$. The antigens may be detected on the red cell and in the serum and secretions. There are three red-cell phenotypes occurring naturally in adult blood as shown in Table 1.

Table 1

| Red cell agglutination reactions with anti-$Le^a$ | Red cell agglutination reactions with anti-$Le^b$ | *Lewis* substances present in serum $Le^a$ | *Lewis* substances present in serum $Le^b$ |
|---|---|---|---|
| + | − | + | − |
| − | + | trace | + |
| − | − | − | − |

Grubb and Morgan[3] first showed that the *Lewis* substances are present in secretions and serum, and Grubb[4] suggested that the *Lewis* antigens are primarily tissue antigens. A blood-group antigen showing somewhat similar behaviour is found in cattle—this is the *J* system: the *J* substance is present on the red cells and also in the serum. Stormont[5] has shown that *J*-negative cells acquire *J* substance from the plasma *in vivo* and *in vitro*. It is known that the $Le^a$ reactivity of the red cell diminishes after repeated washing[2], and Brendemoen[6] showed that the washings inhibited anti-$Le^a$ serum.

It was thus of interest to see whether the *Lewis* red cell antigens were changed *in vivo* after transfusion into a patient of different *Lewis* group. A transfusion from an $Le(a+b-)$ donor was given to a patient of group $Le(a-b+)$. When the two kinds of blood in a post-transfusion sample from the patient were separated (by differential *Rh* agglutination) the donor's cells were found to have becom
$Le(a+b+)$.

The transformation can be reproduced *in vit*
The results of mixing group $A_2$ red cells and plas
of different *Lewis* phenotypes are shown in Table
1 volume of packed red cells to 10 volumes
heparinized plasma (containing streptomycin a
terramycin) were continuously shaken at 35° C. T
plasma was renewed every 24 hr.

Table 2 shows that $Le(a+b-)$ cells, after 24
in $Le(a-b+)$ plasma, have become $Le(a+b+$
$Le(a-b+)$ cells in $Le(a+b-)$ plasma have a
become $Le(a+b+)$. (The results were the same wh
*O* cells and plasma were used.) It was furth
observed that after three days $Le(a+b-)$ a
$Le(a-b+)$ cells lose their antigens to $Le(a-b$
plasma, while the $Le(a-b-)$ cells can acquire eith
antigen.

Table 2. Reactions of Red Blood Cells with *Lewis* Anti
After Incubation in Plasma from Different Donors for 24

| Plasma from persons of *Lewis* phenotype | *Lewis* substances in the plasma $Le^a$ | *Lewis* substances in the plasma $Le^b$ | Red cells of *Lewis* group $Le(a+b-)$ reactions with anti-$Le^a$ | $Le(a+b-)$ anti-$Le^b$ | $Le(a-b+)$ anti-$Le^a$ | $Le(a-b+)$ anti-$Le^b$ | $Le(a-b-)$ anti-$Le^a$ | $Le(a-b-)$ anti-$Le^b$ |
|---|---|---|---|---|---|---|---|---|
| $Le(a+b-)$ | + | − | + | − | + | + | + | − |
| $Le(a-b+)$ | trace | + | + | + | − | + | − | + |
| $Le(a-b-)$ | − | − | +* | − | − | +* | − | − |

* After three days, these reactions were extremely weak, where
the other agglutination reactions were almost as strong as those giv
by fresh cells.

These findings may be correlated with the aberra
*Lewis* reactions given by the red cells of infant
and pregnant women[7] (where perhaps the norm
level of *Lewis* substances in the plasma is disturbed
The absence of the $Le(a+b+)$ phenotype in adul
may be accounted for by the low level of $Le^a$ su
stance in the serum of $Le(a-b+)$ people.

It seems possible that red cells simply adsorb t
*Lewis* antigens *in vivo* and that the fundament
expression of the system is to be found in the seru
antigens.

We wish to thank Dr. W. M. Davidson, of King
College Hospital, for sending blood from patien
who had been transfused.

## Colour Anomaly, the Rayleigh Equation and Selective Adaptation

So long ago as 1878, von Kries[1] reported th
adapting lights fail to upset colour matches. Th
observation was modified in 1934 by Prof. W.
Wright, who showed that lights of very high intensit
above about 15,000 photons, do upset colour matche
Wright considers the breakdown at glare intensiti
to be due to radical photochemical changes. G.

indley has recently reported a detailed investiga- n of this breakdown at high intensities[3]. It might be ggested that the original findings of von Kries— at matches do not break down after adaptation th intensities within the normal range—has import- t implications for theories of colour vision, and particular for the explanation of the Rayleigh uation.

I have confirmed the finding for thirty normal and ır anomalous observers, using a Nagel spectro- aphic anomaloscope, and Ilford 'spectral red' and ectral green' filters for the adapting lights. After aptation to red light, both the monochromatic llow field and the red + green mixture field of e anomaloscope appeared green, the match remain- g true. After adaptation to green light, both fields peared red, the match again remaining true. In e case of two protanomalous and two deuter- omalous subjects, it was found that their matches o held after selective adaptation, though their d + green mixtures were, of course, different from e normal observers' mixture, as was found to be e case by Lord Rayleigh, in 1891.

Now since matches hold after adaptation, although bjects with defective colour vision require abnormal xture intensities to make their match, it appears at the mechanism of colour anomaly must be differ- t from that of selective colour adaptation. But this fference is not generally made evident in discussions colour vision.

On a trichromatic theory in which no special yellow ceptor system is postulated—yellow perception ing attributed to combined activity of red and een systems—we should expect the match to hold ter adaptation, since the perception of yellow is pposed to be the result of red + green mixture hatever the spectral composition of the stimulus ht. Not only is the finding that matches do hold ter selective adaptation compatible with a tri- romatic theory, but also it may be regarded as idence against the supposition that there is a special llow receptor system functional in the foveal region the retina. A special yellow receptor would be imulated by the monochromatic yellow field, but ould be comparatively unaffected by the adapting ht, if this is red or green. If it were affected, it uld scarcely be supposed to produce a shift towards d or green, but only a reduced sensitivity to yellow ht, which again would not allow the match to ld after adaptation.

The stability of colour matches with selective aptation up to high intensities thus provides at st *prima facie* evidence against a foveal yellow ceptor system. This is strengthened by Brindley's ding (*op. cit.*) that when the match does break wn with very high adapting intensities, increase red light is always required to restore the match, matter what the colour of the adapting light. If lective adaptation be supposed to depress the nsitivity of the stimulated systems (for which there a great deal of evidence[4]) whereas anomaly is tributed to abnormal spectral *positions* of the sponse systems, then there is no longer any paradox the fact that colour adaptation does not produce change in colour matches while the anomalous eye quires abnormal mixture intensities to make the atch.

We may tentatively conclude that these facts ) provide evidence against a foveal yellow receptor stem, and (*b*) suggest that colour anomaly is due abnormal spectral positions of the fundamental response curves, rather than to abnormal sensitivities, or to neural leakage[5] across receptor systems.

I thank Prof. W. D. Wright, of the Imperial College of Science and Technology, London, for valuable discussions.

## Semiconductivity of a Type IIb Diamond

IT is a common opinion that diamond is an insulator at room temperature. Diamonds are known to occur in two types[1], classified as I and II. In 1952 it was suggested[2] that type II be further subdivided into II*a* and II*b* ; type II*a* is an insulator with a resistivity of about $10^{14}$ ohm-cm., whereas type II*b* is a semi-conductor[3]. Although this semiconductivity would point to impurities, I am inclined to the view that some type of crystal imperfection may be the primary cause.

In this communication it will be shown that in a temperature-range slightly above room temperature, type II*b* diamonds exhibit conductivity which depends on temperature, the relation taking the form $\exp(-W/2kT)$. The energy gap between the imperfection level and the conduction band (or the valence band, as the case may be) of the diamond examined in our laboratory was found to be 0·70 eV., which is about the same as the energy gap of germanium in the intrinsic range. This value is appreciably smaller than the energy gap of diamonds in the intrinsic region, which amounts to about 6 eV.

The size of the diamond, which came from the Premier Mine, South Africa, was 6·5 mm. × 2·0 mm. × 1·9 mm.[3]. A thin layer of silver was deposited on two opposite faces (size of each face, 6·5 mm. × 2·0 mm.) and the stone was then clamped between two silver electrodes. A constant voltage of 25 V. was applied over the electrodes. The diamond was held in a holder which was placed in a furnace. Table 1 shows the temperature $T°$ abs. at which the electrical current through the diamond was measured, the electrical current $i$ in milliamp., the resistance $R$ in ohms as calculated by applying Ohm's law, log $R$ and the value of $1/T$ abs. From a graph of log $R$ against $1/T$ abs. and the formula $\rho = A \exp W/2kT$, the energy gap $W$ was calculated. In this formula, $\rho$ is the resistivity, $A$ a constant and $k$ the Boltzmann constant. At $T = 293{\cdot}3°$ abs., $\rho = 7{\cdot}1 \times 10^{8}$ ohm-cm. The observations were complicated by the fact that, on applying the voltage, the current rose to an initial value followed by a slight drop which was of the order of a few per cent. The final value was measured after a few seconds, and this value was used for drawing the graph. This drop in current, relatively higher at higher currents, was in all probability due to polarization or a space-charge effect.

The figures of Table 1 were obtained by starting at 18·7° C. and gradually increasing the temperature. Going the reverse way, that is from higher to lower temperatures, a type of hysteresis was encountered,

Table 1

| $T$ (° abs.) | $i$ (m.amp.) | $R \times 10^{-5}$ (ohms) | log $R$ | $\frac{1}{T} \times 10^3$ |
|---|---|---|---|---|
| 291·9 | 0·236 | 1·059 | 5·025 | 3·426 |
| 293·3 | 0·252 | 0·992 | 4·997 | 3·410 |

| 299·5 | 0·325 | 0·769 | 4·886 | 3·339 |
| 301·2 | 0·346 | 0·723 | 4·859 | 3·320 |
| 303·3 | 0·390 | 0·641 | 4·807 | 3·297 |
| 304·7 | 0·418 | 0·598 | 4·777 | 3·282 |
| 307·1 | 0·472 | 0·530 | 4·724 | 3·256 |
| 308·7 | 0·502 | 0·498 | 4·697 | 3·239 |
| 310·1 | 0·523 | 0·478 | 4·679 | 3·225 |
| 312·3 | 0·584 | 0·428 | 4·631 | 3·202 |
| 314·5 | 0·632 | 0·396 | 4·597 | 3·180 |
| 317·5 | 0·727 | 0·344 | 4·537 | 3·150 |
| 319·9 | 0·776 | 0·322 | 4·508 | 3·126 |
| 321·7 | 0·828 | 0·302 | 4·480 | 3·109 |
| 323·1 | 0·868 | 0·288 | 4·459 | 3·095 |

the ($i,T$) graph being shifted in the direction of the $i$-axis. This shift amounted to 21 per cent at 30° C. under the experimental conditions of cooling the furnace in contact with the air of the room. The hysteresis would mean that the electrons are subject to a delay factor on falling back into the lower energy-level. The original state of the diamond is, however, fully restored in the course of time when left at room temperature, which shows that the conductivity is purely electronic.

The diamond can be used as a crystal rectifier, as was verified by measuring forward and reverse current after the stone had been provided with a silver layer on the one side and a point contact on the other side. At a temperature of 200° C. and 5 V., the forward current was 100 microamp., the reverse current practically nil; currents of the order of a few milliamperes were observed at 125 V. The extraordinary aspect of the semiconductivity of type II*b* diamonds is obvious from the fact that some of these may carry currents of the order of 10 amp. at 125 V. There is an indication that at such high currents permanent changes are produced.

We have also verified that all blue diamonds are of type II*b*. There are, however, type II*b* diamonds which do not show a blue coloration. The example discussed in this communication was slightly brownish. Two blue diamonds have been analysed spectrochemically, the only impurity element found being silicon. As the valency of this element is four, it could scarcely act either as a donor or an acceptor atom.

Blackwell and Sutherland expressed the opinion[4] that the type II diamond is a normal pure diamond, whereas all type I diamonds have some impurity or imperfection in their structure which would account for the anomalies of this type. In a later publication[5], Sutherland, Blackwell and Simeral gave further evidence of the perfection of type II, based on spectrographic measurements. Our semi-conducting diamond, in view of its transparency in the ultraviolet, would be of type II*S* according to Sutherland's nomenclature; but it is not a perfect crystal, nor is it a chemically pure diamond.

Lark-Horovitz and co-workers have shown that lattice disorder may produce $p$-type conductivity, the lattice defects acting as acceptors[6]. James L. Brophy, who examined the Hall effect of a blue semiconducting diamond, has informed me (private communication) that the sample was $p$-type over the entire temperature range − 40° to 60° C. He established an activation energy of 0·35 eV., as was also found for the diamond examined by Leivo and Smoluchowski[7].

I thank Industrial Distributors (1946), Ltd., f
making the diamond available, and in particular M
E. T. S. Brown, whose stimulating interest in resea
on diamonds is gladly acknowledged. I am a
grateful for information given by Mr. J. J. Broph
of the Armour Research Foundation, of the Illin
Institute of Technology, Chicago.

## Radar and Phosphorescence at Sea

THE idea of ship-borne radar stimulating phosphc
escence in the sea was first put forward by Capta
F. G. Baker of M.V. *British Premier* in the *Mari
Observer* (October 1952). The next case was t
S.S. *Strathmore*, Captain J. M. Plaice, in the san
journal (January 1954). This ship saw patches
light which flashed about once a second, thou
there was none of the usual small specks of pho
phorescence in the ship's wake or bow wave. Wh
the radar was switched off, the patches near the sh
faded out, though some distant ones were still faint
visible. On switching the radar on again, the patch
reappeared near the ship, but less brightly, and so
disappeared altogether. These reports were referr
to authorities in England, including the Nav
Weather Service and the Institute of Navigatio
Their opinion was that it was most unlikely th
radar could stimulate any phosphorescence in t
sea, but invited more reports.

At 2 a.m. local time on September 5, 1954, t
M.V. *Malaita* was steering a course of 210° tru
passing Hardman Islands off the eastern extremi
of New Guinea. The second officer saw a loom
light on the horizon to the south-west, extendi
over an arc of about 15°. There were submerg
reefs in that direction, and as the ship passed the
the illumination remained apparently in coinciden
with the reefs, about two miles off.

We were steering for Bright Island Light, and ne
saw another loom of light extending from ahead
two points on the port bow. This again coincid
with the direction of submerged reefs, but prov
to be much closer than the reefs. The light fi
showed as a brilliant line along the horizon, like
breaking reef, or a line squall. As we got closer,
was found to be showing on the radar screen like
rain squall; but there was only very light ra
falling at the time from low clouds, and the visibili
was clear enough to see some islands beyond t
phosphorescence, about three miles away. Both
the screen and to the naked eye, the illuminati
appeared to cover an area about two miles squa

g in lines and patches like sandbanks in an ary.

Vhile the nearest reef in that direction was still miles away, the ship entered the first big patch phosphorescence, which appeared to be lit from epth of 30 ft., as the ship passed over it. The e was 2.20 a.m. and the ship then had to alter rse to the westward, to pass through China Strait. break of the ship's bow wave showed dark against light from the phosphorescence below. There was noticeable increase in rainfall as the ship reached area of illumination. The wind was light (south- t, force two), the air temperature was 78° F., and sea was about the same.

t was necessary here to keep the radar working the time, and there was no opportunity to switch ff to see whether it was stimulating the phos- rescence, which was particularly brilliant, in fact te disturbing in the circumstances. My report he Meteorological Office was sent to some experts England, who received it with understandable redulity, especially the picture on the radar een.

he next sighting from the M.V. *Malaita* occurred months later in the Solomon Islands. At 3 a.m. l time on March 4, 1955, when the wind was th-west, force 3, the air temperature 76° F., and sea 84° F., the sky was clouded with strato- nulus and there was some rain in the distance. e ship was three miles off the coast of Guadalcanal, water about 400 fathoms deep, and making about knots. The first patch of phosphorescence appeared the starboard bow, about a mile distant, and king like a breaking reef. The radar was working the time. Two minutes later a large number of hes appeared over a radius of about two miles, il the illumination was so bright that visibility the horizon and land was affected. The patches ight were oval, about fifty feet in length, and looked hough their light source was a few fathoms below surface. They were flashing regularly, but not phase with each other. On attempting to time m, I found that they were flashing in exact e with the beat of the ship's engines, 94 per .

ome of the patches were only 100 ft. from the p, and we even passed over some which lay in our h. Twenty minutes after the first sighting, the ches started to lose their strength, and we tried tching off the radar. The patches then faded , but reappeared when the radar was switched on in. Finally, all the patches had been passed, and min. after the first sighting they had all gone. The ches appeared to have no movement of their , nor did they show any trace on the radar een.

he problems involved in the apparent connexion ween radar and phosphorescence in the sea call some co-ordination between the meteorologists, anographers, biologists and radio-physicists. While is easy to believe that phosphorescent plankton ld pulsate with the beat of a ship's engines, there ms to be no explanation for the observed stimula- n of phosphorescence by radar. The echo shown the screen is still less understandable, and has y been reported by one ship to my knowledge.

here are some strange forms of phosphorescence sea known as 'phosphorescent wheels', which are s of light in the water radiating from a point and ating clockwise or anticlockwise over an area of miles or more. These rays of light are curved, are only a few feet wide, and apparently travel at something like one hundred knots; they suggest to me the rays which are sometimes seen around the aurora borealis or australis. Perhaps the phosphorescence in the sea is stimulated both by radar waves and by disturbances in the earth's magnetic field, such as occur on occasions of brilliant auroræ.

## A Reagent for the Detection of Chloride and of Certain Purines and Pyrimidines on Paper Chromatograms

INORGANIC chloride is commonly present in mixtures of biological origin and, if not removed, may interfere with the identification of the organic constituents. A silver nitrate reagent has been developed which will detect as little as 1 μgm. of chloride ion on a paper chromatogram.

The reagent is prepared by dissolving 0·2 gm. of bromophenol blue in 50 ml. of acetone and adding an equal volume of 2 per cent silver nitrate solution. It is stable for one week. Chromatograms were run in butanol/acetic acid/water (60 : 15 : 25), dried, treated with ammonia vapour (to prevent a 'fast' staining of the lower regions of the paper) and the excess ammonia removed in a current of air. The papers were dipped in the reagent and dried at room temperature. They were then rinsed in distilled water until the background was white or pale blue, and the spots were marked while the paper was still damp.

Chloride, bromide and iodide showed as rose spots ($R_F = 0·20$) which became violet as the paper dried. Purines, pyrimidines and other substances capable of giving a spot showed up blue. It is suggested that the distinctive colour obtained with these halogen ions, in conjunction with their $R_F$ values, will serve as a ready means of demonstrating their presence on a chromatogram.

After being run on paper as described above, the following amounts of various substances could be detected: adenine, guanine, xanthine and hypoxanthine 0·5 μgm.; adenylic acid 1 μgm.; potassium chloride 2 μgm.; cytosine 5 μgm. Uric acid, uracil, thymine, cytidylic acid and sodium veronal did not react.

For chloride only, the coloured spot was more obvious if 5 ml. of the above reagent was diluted with 95 ml. of 1 per cent silver nitrate in aqueous acetone; the silver chloride precipitate on the paper adsorbed the dye strongly from this dilute solution and became plainly visible as a rose-coloured spot on a pale blue background.

It would appear that compounds in the purine and pyrimidine series must contain an intact imidazole ring, or an amino substituent in the pyrimidine ring, in order to react. In a hydrolysate of nucleic acid, spots revealed by ultra-violet light may be further differentiated by this reagent.

A silver dichromate reagent has been proposed for the purines[1]; but, in my experience, the method is insensitive and difficult to apply. A bromophenol blue–mercuric chloride reagent used by Geschwind and Li[2] to reveal proteins after paper electrophoresis has been found useful in some cases, but it is not so sensitive as silver nitrate.

It is suggested that the reagent might be of general application wherever a compound forms an insoluble complex with silver. For example, carbobenzoxy-β-alanine thiophenol ester (a derivative employed in peptide synthesis) is not detectable with reagents commonly used, but forms an insoluble complex with silver nitrate and appears as a blue spot on a chromatogram. With the aid of the reagent, the progress of the coupling of this ester with an amino-acid can be followed by paper chromatography, the carbobenzoxy-β-alanine thiophenol ester spot disappearing as the coupling proceeds.

The reagent thus has three distinct fields of application: first, in the detection of halogen ions; secondly, to reveal spots due to compounds forming insoluble complexes with silver; and finally, as a sensitive reagent for certain purine and pyrimidine compounds.

## Origin of Penicillin-resistant *Staphylococcus pyogenes*

CLASSIFICATION of strains of staphylococci by their reactions to bacteriophages has been extensively used in epidemiological studies of staphylococcal infection. Thus three main groups of these organisms can be separated, and strains belonging to different groups have been considered to be unrelated. For example, a patient who is infected with a strain of one group, when later found to be infected with a strain belonging to another group, is regarded as having suffered a second infection from a different source.

The present high prevalence of penicillin-resistant staphylococci in the community, associated with the extensive therapeutic use of this antibiotic, is believed to be due largely to their selective spread associated with suppression of the sensitive strains. The fact that the majority of antibiotic-resistant strains belong to phage group III and the majority of sensitive strains to groups I and II might seem to support this view[1].

The alternative view is that antibiotic-resistant strains originate by mutation from sensitive strains under the impact of the antibiotic during treatment. If this is so, one would expect the distribution of resistant strains between the various phage groups to be the same as that of the sensitive strains, that is, the majority would be of groups I and II; but this is not the case. However, Barber and Whitehead[2] found that antibiotic-sensitive strains of group III tend to become resistant to penicillin more readily than strains of other groups, and this might afford an explanation of their preponderance. Another explanation is suggested by the results of the following experiments involving the production of antibiotic resistance *in vitro*.

These experiments were carried out with cultures of penicillin-sensitive *Staphylococcus pyogenes* derived from single colonies. The cultures were exposed to penicillin by growing them on the surface of nutrient agar plates containing various concentr tions of the antibiotic. After incubation, these plat showed two variant types of colony which we resistant to penicillin. The first, and most frequer was a relatively slow-growing, unpigmented colon and cultures from it produced no penicillinase n did they show any change in phage type. Penicilli resistant variants of this type have been obtain *in vitro* by many other investigators, but do n appear to occur *in vivo*. The second, less-frequer type of variant gave colonies which were larg opaque and pigmented; they produced penicillinas and the majority belonged to phage group III, ev when their antibiotic-sensitive parent cultures b longed to groups I and II. A change in phage ty thus occurred in association with the acquisiti of antibiotic-resistance, and this may explain tl preponderance of resistant strains belonging group III.

If this change can also occur *in vivo*, the develo ment of antibiotic resistance within the individu patient during treatment must be considered as more frequent occurrence than hitherto believed.

## Quercetin Glucosiduronic Acid from the French Bean

THE monoglucosiduronic acids of polyhydrox flavones, for example, chrysin, baicalein and scut larein, that have been isolated from plant materi occur chiefly in the genus *Scutellaria*[1]. These ha been shown to be β-D-glucopyranuronides with high affinity for animal tissue β-glucuronidas Recently, a conjugate of apigenin with glucuror acid has been found in the flowers of *Erigeron annuu* French beans (*Phaseolus vulgaris*) have been reporte to contain a glycoside which on acid hydroly yielded glucuronic acid and a flavone that appear to be quercetin; this has been confirmed and t compound has been found to be a substrate f β-glucuronidase.

The beans (var. Prince: other varieties yield much less product) were cultivated in Aberdeenshi and collected just prior to flowering. Extraction the leaf by the method previously described yield quercetin glucosiduronic acid, melting point 190–19 (corr.), $[\alpha]_D^{18}$ − 50° (c, 1 in 50 per cent aqueo pyridine) for the anhydrous product. After bei recrystallized from water and dried at 100° *in vac* the product lost 7·2 per cent in weight, correspondi to $C_{21}H_{18}O_{13},2H_2O$ (found for the anhydrous produc C, 52·9; H, 3·9; calc. for $C_{21}H_{18}O_{13}$: C, 52· H, 3·8 per cent). The yield was 0·25 per cent of t dry weight of leaf.

Hydrolysis with a mouse-liver β-glucuronide preparation in acetate buffer at *p*H 5·2, or wi hot aqueous sulphuric acid (10 per cent w/v), yield quercetin, melting points 300–303° and 304–30 (uncorr.) respectively, after recrystallization fro eous ethanol. In the enzymic hydrolysis, 10 mgm. ercetin glucosiduronic acid yielded 4·2 mgm. ercetin after 24 hr. incubation at 38°, correspond- to 75 per cent hydrolysis. There was no de- ssion of the melting points on admixture with an hentic specimen of quercetin, melting point –306° (uncorr.). The product of hydrolysis and hentic quercetin when treated with anhydrous ium acetate and acetic anhydride yielded identical ta-acetates, melting points 191–192° and 193–194° rr.) respectively. Examination of the ultra-violet ctral adsorption in ethanolic solution showed orption maxima at 260 and 361 mμ for quercetin cosiduronic acid, and at 256 and 373 mμ for ercetin.

Determination of reducing sugar showed that the ymic hydrolysis was strongly inhibited by a boiled cosaccharate solution (a $2\cdot5 \times 10^{-4}$ *M* solution sed 70 per cent inhibition of the hydrolysis of a $\times 10^{-3}$ *M* quercetin glucosiduronic acid solution), ving that the responsible enzyme was β-gluc- nidase and thus that the glycoside has a β-D- copyranoside structure[1]. The value of $K_m$, the sociation constant of the enzyme-substrate com- x, for quercetin glucosiduronic acid was determined irectly by its action as a competing substrate in hydrolysis of phenolphthalein glucuronide by use-liver β-glucuronidase. Mean values for $K_m$ of $\times 10^{-4}$ *M* at *p*H 4·5, and $9\cdot8 \times 10^{-4}$ *M* at *p*H 5·2 re obtained—that is, similar to the values found other plant flavone glucosiduronic acids[1].

When tested by the procedure of Levvy[2], there s no evidence of the existence in the leaf, root or t nodules of the French bean of an enzyme pable of decomposing phenolphthalein glucuronide *p*H 4·5.

Table 1

| Aglycone | Positions of nuclear hydroxyls in flavone | Source of glucosiduronic acid |
|---|---|---|
| hrysin | 5,7 | Leaf of *Scutellaria galericulata* |
| pigenin* | 5,7,4′ | Flower of *Erigeron annuus* |
| aicalein | 5,6,7 | Root of *Scutellaria baicalensis* |
| cutellarein | 5,6,7,4′ | Leaf of *Scutellaria* sp. Leaf of *Centaurea scabiosa* |
| uercetin | 3,5,7,3′,4′ | Leaf of *Phaseolus vulgaris* |

In this instance, the β-glucopyranuronide structure of the glucosid- nic acid has still to be demonstrated.

It is interesting to note that a few plants are able synthesize hetero-glucosiduronic acids akin to ose excreted by animals. The structural similarity the parent flavones is demonstrated in Table 1. the case of apigenin glucosiduronic acid, the point conjugation with glucuronic acid has been shown be at $C_7$ of the flavone nucleus[3]; it had previously en suggested[5], from indirect evidence, that this s also the position of glycosidic linkage for baicalein d scutellarein.

I thank the North of Scotland College of Agriculture cultivating the beans used in these experiments.
